Chambers's Journal
SEVENTH SERIES

THE MOUNTAINOUS MR NEUBURG.

By W. DOUGLAS NEWTON, Author of *War, The North Afire, The Undying Story, Phillip in Particular, The War Cache, Green Ladies, Westward with the Prince of Wales*, &c.

CHAPTER I.

I.

A LITTLE, knuckly man bounded into Clement Seadon's cabin with an india-rubber violence. He snapped the door shut behind him, and faced the startled young man.

'You're Clement Seadon,' he cried; 'I'm Hartley Hard.'

The young man stopped unpacking.

'I don't think I know you,' he said.

'You needn't think. You don't know. I'm a complete stranger to you—in the flesh. But don't talk. I haven't much time.'

Clement glanced at the umbrella and the obvious shore-rig of the bounding little man.

'In fact,' he said, in the other's manner, 'you have no time at all. "All ashore" was called two minutes ago.'

'Oh, don't talk,' panted the little man. 'This thing is terribly important. I mustn't lose a moment telling you. You know Heloise Reys?'

'Not at all,' said Clement dryly. He began again to unpack.

'For Heaven's sake, don't quibble, man. You know her. You came from London to Liverpool in the same carriage as Heloise Reys.'

'Oh, that was Heloise Reys,' said the young man, dropping his dress-shirts and looking up with interest. 'The Gorgon woman with her called her Loise.'

'Nickname,' said the little man breathlessly. 'Her name is really Heloise. What I mean to say is, you *do* know her.'

'Not really,' said Clement with exasperating (and, one is afraid, deliberate) casualness. 'A mere chance acquaintance. I met her in the C.P.R. Shipping-Office. And I met her on the boat-train—that's all.'

He refrained from telling the little man that, having encountered her in the C.P.R. Office, he had determinedly looked out for her on the boat-train.

The little man danced about in a fury of anxiety.

'Please *do* remember that I have the barest possible time to tell you what I must tell you. Don't interrupt. Don't quibble. You know her. She is good-looking.'

'Very good-looking,' said Clement, staring at the little man in amazement.

'She is a charming girl,' urged the little man.

'Perfectly charming,' said Clement. 'That is, so far as I can see.'

'Of very good family, too,' snapped the little man.

'Probably,' said Clement. 'But I didn't find that out.'

'Don't have to—take it from me. Very good family. No father, no mother.'

'That,' said Clement, 'I shall have to take from you.'

His astonishment had given way to a sort of guarded amusement. He was of the genial type of young man, one who could see the humorous side of things quickly. He saw the humour of this situation, but, at the same time, he was forming a very definite opinion about the little, bouncy man.

The little, bouncy man waved his umbrella in excitement.

'Do take it from me,' he cried. 'No mother, no father. No encumbrances, and no one to control her. Remember that: no one to watch over her. And she is very well off. Very rich.'

Clement could only stare. The little man swept on: 'Very beautiful. Very charming. A girl with a gentle, tender heart—much too tender. Too quixotic. A fine character. Good family—and rich. Extremely rich. You understand all that?'

'Look here—what on earth are you driving at?' cried the astounded Clement.

'But *do* you understand?' wailed the little man. 'Have you grasped it all? A worthy girl. A girl worthy of any man. A girl that any man can be proud of. A girl'——

This was too much for Clement. 'I say,' he burst out—'I say, are you—are you asking me to marry her?'

The excited dance of the little man now took on a touch of relief as well as anxiety. 'You

 [*All Rights Reserved.*]

grasp it. You see it,' he trilled. 'Assuredly. Marry her—that 's it.'

'My dear idiot,' shouted Clement—'my dear madman, don't you understand that'——

'No time to understand,' skated on the little man. 'No time at all. Know it 's all rapid and wrong and amazing, but that 's what I want. You marry her. You can do it. You 're young. Young and handsome and healthy. And a sea-voyage. Sea-voyages are the chance for sentiment. Idle days, luxurious days. Moonlight—looking at the wake. Oh, the very chance for falling in love.'

'Do you realise you 're talking like an idiot? I 've only just met Miss'——

'I know. I know. Awfully like an idiot. That 's because I am in such a hurry. I know exactly how it all sounds to you—but, really, I can't help myself. Such a little time. But that 's what I want you to do—really. Fall in love with her. Make her fall in love with you. Make her promise to marry you. Before she gets to Canada make her promise to marry you. Don't let her put you off. Force her to do it.'

Clement sat down heavily on his bunk. He stared, amazed, at the little man.

'I 'm afraid you 're mad,' he said.

'Mad?' snapped the little man. 'I 'm not mad. I 'm a lawyer.'

II.

Clement wanted to say that even lawyers went mad sometimes, but the little man hurled himself along.

'I 'm a lawyer. I 'm her lawyer. I 'm your lawyer too—one of them. That 's luck. When I saw you come out of the train with her—saw that you knew her—that you were friends—I noted that down as a piece of luck. You see, I knew *you* were all right. Knew that through business—oh, I 'm a partner of Rigby & Root.'

'My lawyers?' cried Clement.

'Yes! Yes! Haven't I been telling you that? We 're her lawyers too. When I saw you together I said to myself, "Good; that 's a second line of offence. If I fail to bring her to reason, I fall back on Clement Seadon — Mr Clement Seadon. He 'll be my second line. Good fellow. Good family. Young, attractive, handsome to eye. Has wits. Has capacity. Has a brain in his head. Has pluck and physical strength too. Can carry a thing through in spite of danger."'

As he said that his rapid eye glinted on Clement. He was staccato, but he was not stupid. Clement stiffened. He was the type of clean young Anglo-Saxon who did stiffen at the hint of danger; the type that goes about quietly, calmly, avoiding trouble, but is not really heart-broken when trouble comes along; the type, that is, that still tingles to the spirit of adventure in spite of the Savile Row suitings that seem to give an air of comfortable civilisedness.

The little lawyer saw Clement stiffen; he chuckled internally and continued his express monologue.

'That 's what I said to myself when I saw you. I said, "Mr Clement Seadon has all the qualities necessary. An admirable second line of offence. And well-off, too. Rich. Rich enough to make his part in the affair a decent and honourable one. He 's not an adventurer hunting heiresses." That 's what I said when I saw you. And I went off to Heloise Reys's cabin and reasoned with her, tried to bring her to reason. Oh, I strove. I strove. I talked my best.'

He stopped and waved his umbrella in a gesture of hopelessness.

'You strove, and strove—and then had to fall back on your second line of offence,' said Clement, helping him out.

Clement's mind was in a curious condition. He realised that all this was madder than anything had any right to be—and yet he was rather intrigued, rather interested. He could not have told why. The fact that the little man was a lawyer, and his own lawyer at that, may have been the reason. Or it may have been that suggestion of danger, of adventure, called to that instinct lying dormant in the young of Clement's race. Whatever it was, mad though he felt the whole business to be, he sat and listened.

The lawyer said, 'You are right. I could do nothing with her. I failed. I could not bring her to reason. She is so quixotic—so headstrong. She has the wrongest sense of what is right. . . . And, then, I have no proofs. Nothing definite. Only fears, only suspicions. I couldn't clinch the matter with her. I couldn't bring home anything to her.'

'And what were you trying to bring home to her?' demanded Clement, who really thought he was entitled to some explanation.

'Bring home to her? The truth about that scamp. I was trying to make her see that she should not go out to Canada to marry him.'

Clement gasped. Also, he felt a little stab of pain. Heloise was certainly most extraordinarily attractive.

'Marry him? Marry whom? Haven't you just been insisting that she should be forced to marry *me*?'

'Of course,' shouted the little man. 'That 's it. That 's what I 'm driving at.'

'But what are you driving at?' gasped Clement. 'First you tell me to get her to marry me; then you tell me she is going to marry some one else.'

'Perfectly true,' said the little man. 'She is making this journey to Canada to marry some one else—a man named Henry Gunning.'

Clement fell back, too staggered for thought. 'Are you a lawyer,' he demanded, 'or are you an apostle of the Mormons?'

The little lawyer rushed over to Clement and caught him by the lapel of his coat. 'No! No! No!' he cried. 'Please do understand. It is this hurry that has made everything so complicated. She is going to Canada to marry Henry Gunning. But she must not marry him. She must be prevented. That's what I want you to do. I want you to make her marry you in order that she won't marry Gunning.'

'And why shouldn't she marry the man she wants to?' Clement demanded.

'Because,' said the lawyer, speaking earnestly and impressively—'because it's a swindle. She's got into the hands of rogues, of swindlers, of criminals. Of that I am sure. The whole thing is terribly evil. And she must be saved. She must be saved. You must save her.'

Clement was about to answer. There was a knock on the cabin door. Clement called, 'Come in.'

The door opened about a foot. An evil and repulsive face looked in. The little eyes in the ugly face swivelled all round the cabin in a swift, furtive glance. They took in Clement; they took in the little lawyer. A palish tongue licked purple, dry lips. A husky voice croaked, 'Beg pardin', sir!'

The little lawyer snapped, 'What do you want, man?'

'Beg pardin',' said the hoarse voice again. 'Just looking round ter see if all visiters is ashore. Bedroom steward, sir.'

The fully-opened door revealed the white coat and bobbly trousers of a veritable bedroom steward.

'All right, my man,' said the little lawyer; 'I'm going ashore in a minute.'

'Ha!' said the steward, coming in with the satisfaction on his face such as policemen wear when they catch an authentic burglar. '*Should* be ashore. Orders is that all visiters sh'd be ashore. Come this way, sir. Quick, please, sir.'

'I'm going ashore in a minute,' said the little lawyer.

'Orders, sir. Gotter be now, sir.'

'Get out of this,' snapped the lawyer. 'I'll go ashore before the ship sails, never you fear.'

The steward came forward with an air of menace in his bearing.

'You go ashore now, see. Them's me orders, an' I've got to see that it's done—can't stop about arguing.'

'I don't want you to,' said the little man decisively. 'Particularly as Captain Heavy is the person you should argue with. If Captain Heavy was wrong in saying I could stop aboard, I think you should be the one to tell him, not I.'

'Cap'n Heavy! Why didn't you say that 'erfore?' snarled the man. He went sullenly out of the cabin. The little lawyer waited for a minute; then he slipped out too. He darted up the little alleyway that led to the main passage along the deck. Clement heard him say in a tart voice, 'My good man, I know my way off this ship—you needn't hang about here waiting to conduct me off.'

In a moment he was back with Clement, talking rapidly again, but this time in a noticeably lowered voice.

'He's one of them. I thought he was. You'll have to be on your guard against that steward.'

'One of whom?' asked Clement, trying to keep pace with the happenings. 'One of the rogues, do you mean? Good heavens! do you mean to say there is a sort of Villains' Gang of them aboard this ship?'

'I don't say it,' said the little man grimly, 'but I shouldn't be at all surprised if it were so. It's a big thing, a terribly big thing, my friend, this marriage of Heloise. It is a matter of a million pounds sterling and more.'

III.

'You are rather stunning as well as other things,' said Clement limply.

He really was feeling a trifle dazed. The little man had so hustling a manner. Also, his own knowledge of the girl, Heloise Reys, was of the faintest kind. She was just a tall, slim girl whom he had found attractive enough to want to know again after his first meeting. She was quite pleasant, quite English, quite natural. Apart from her special attraction, she was just one of the millions of crisp, self-assured, and self-contained young women of Britain.

He had met her, as he had said, twice. The first time had been a delightful accident. He had arrived to book his passage at the Canadian Pacific Shipping-Office in Cockspur Street, London, to find her there on the same errand.

What is more, there was a certain sense of comradeship in that action, for both intended to sail to Canada in the same ship; both were booking cabins in the *Empress of Prague*. One shipping-clerk attended to both; he left the one cabin-plan before them from which to choose their berths, while he went away on the business of registering their tickets.

Clement had only to glance once at the cabin-plan to make his decision. He had sailed on the *Empress* before. All he had to do was to see whether his old cabin, which had been a comfortable one, was unreserved. It was unreserved. He jotted down its number to give to the clerk when he came back.

Heloise and her companion were not so decisive. They had the choice of several double cabins offered to them, and Heloise, at least, showed all the hesitant ignorance proper to people unaccustomed to sea-travel. The other woman was making suggestions, but Clement

did not pay any attention to her. She was obviously a companion, a servant, though of the cultured sort.

The clerk, before he had gone away, had tactfully pointed out a large double cabin. After having spoken in glowing terms of it, he had gone off, leaving the decision to the ladies. Clement had nothing against that clerk. As a clerk, he knew his business, which was to fill up cabins. He was merely doing his duty in suggesting that cabin to people who did not know the art of selecting cabins—there were so many people who knew it too well, and would leave that cabin on his hands.

Clement noted the battle of indecision with some amusement; also with some interest, because Heloise (only, he didn't know she was Heloise then) was extremely pretty. Also, he thought she was of that trusting and sweet disposition that will take the word of anybody—even of a shipping-clerk. Obviously she was going to follow his suggestion.

When the shipping-clerk went to the back of the office Clement saw to it that she didn't. He looked up at her as she puzzled over the deck-plan, smiled in a disarming way, and said, 'I say, if you don't mind my butting in, I wouldn't take that inner room. You'll find it hot and rather airless, and there's no light at all except artificial light.'

She answered him before she thought about who he was. 'Are you sure of that?'

'Quite,' he told her. 'I know the *Empress of Prague* well; you'll be quite comfortable on her, particularly if you take, say, that cabin over there, instead of that inner one.'

As he spoke he heard a sniff—an indignant sniff—from the companion. He looked beyond the girl, and saw a comely, chilly, thick-set, middle-aged woman; a woman who had a broad and attractive smile which, somehow, did not seem to penetrate deeper than the surface of her skin. It was the sniff and the smile that led Clement to christen her the Gorgon, then and there.

But the girl herself was not sniffing in moral indignation. She was pleased and friendly. 'But it is jolly of you to help,' she cried. 'You are sure that one over there is the better cabin?'

'As sure as I like light and fresh air,' Clement smiled at her. 'You'll get both in that. You see, it's an outside cabin; has—port-holes—windows, you know. And it's roomier. I can assure you on the word of one who knows.'

'Then that's the one we'll have, Méduse,' said the girl; and the Gorgon (really, Clement had been very apt in his nickname) said in a light voice slightly tipped with frost, 'That is also the one I suggested. Remember I, too, have travelled on the sea before, Loise.'

The girl paid no attention to that. She did not allow herself to be distracted from Clement, as she was obviously meant to be distracted. She was, in fact, rather pleased to meet a young, good-looking, polished man, who was to be a companion during the voyage across the Atlantic. She said, smiling, 'I'm thoroughly mystified by all this sort of thing. I've never done anything but the cross-Channel trip before, and then only by daylight. The tricks of cabins and comfort are dark secrets, as yet. It is really very good of you to give me that tip.'

'Oh, travellers are a brotherhood who should band together in the face of the common enemy,' said Clement cheerfully.

'Are we going to have common enemies?' she asked pleasantly.

'Not on the *Empress*,' said Clement. 'It's a happy ship. But still there are always little things where the hardened traveller can help.'

'Hardened?' she echoed. 'You must have begun before your teens, then. . . . But it is rather nice—oh, and lucky—to meet some one who is going by the same boat. I have a feeling that going by boat must be rather like going to a new school—everybody is strange and reserved. So that if one knows some one already . . .' They went galloping off into the chatter that overtakes vivid people who have found a common ground, and not even the sniffs of the Gorgon could check them. Definitely, Clement thought then, the Gorgon wanted to claw the girl away. She disliked the acquaintance.

Still, she did not have her way, though she hurried the girl off with some speed when the bargain over the counter had been completed. Even then the girl, as she went, held out the pleasant promise of their future meeting.

'We'll meet again, then, on board,' she had nodded to him as she left the shipping-office.

'Or on the boat-train,' said Clement. 'You'll go up to Liverpool by that?'

'Of course,' she said, smiling. 'Until then.'

Clement completed his own reservation, and went out of the office with a feeling of elation. He had already been looking forward to his trip to Canada, where he hoped to get some sport—trout and salmon fishing, and later some duck-shooting, and, perhaps, a chance at moose. But now his trip seemed a much jollier affair, and he wasn't thinking of sport when he felt that.

She was so extraordinarily pretty. She had such an extraordinary charm. She was fine and upspringing, if she was slim. She carried herself so well. And her face was so vivid and alluring. Her skin was cool and white and glowing, and her features delicate and exquisite. She was more than pretty; she was beautiful.

And that candour and kindness that seemed to be her nature. A sort of honesty, a nobility that placed her right above petty feminine things—yet there was no denying the warm and tender femininity of her nature. A real woman, a beautiful woman. A woman in a million.

(Continued on page 19.)

THE LIEUTENANT OF THE TOWER.

By Major-General Sir GEORGE YOUNGHUSBAND, K.C.M.G., K.C.I.E., C.B.,
Keeper of the Jewel-House.

I.

THE Lieutenant of the Tower, though he holds an office a little less ancient than that of the Constable, is perhaps an even more historic figure. And this is due chiefly to his intimate connection, both by name and by office, with some of the greatest tragedies that have occurred in English history.

The Tower of London was built as a great fortress and a palace of kings, and only later, and especially in Tudor days, fell to the sinister and ill-omened position of a prison and a place of torture. It was coeval with this great degradation that the Constable disappears as the prominent figure at the Tower, and his place is taken by the Lieutenant.

The Tower was a very unsavoury place in those days, quite apart from its tragic history. As we know, to be 'committed to the Tower' was little short of being sentenced to death; indeed, as one Lieutenant remarked to a prisoner, 'The Tower is an easy place to get into, and a very difficult place to get out of—but by way of the scaffold.' Not only were its rooms cold and dark, and, even for rich persons who could afford to pay for the luxury, difficult to keep warm and dry, but it was very densely populated with all sorts and conditions of people, who by right or heredity had gained a footing there. These had built mean shanties and lean-to's, whereby free passage was much obstructed, and they were densely crowded. Sanitation was little understood or attended to, so that in this congenial hotbed diseases as virulent as small-pox or cholera flourished. Round all was the moat, a fetid ditch in which had been deposited the filth of ages. The Constable, who had not, except in remote ages, been a very constant resident at the Tower, now found that amid such insalubrious surroundings he was expected to be head jailer to large numbers of prisoners, some of the greatest importance, and requiring very close guardianship. He therefore decided to live at his ease elsewhere, retaining only a small lodging in the Tower which he could use at pleasure, and handed over his executive duties to his second-in-command, who bore, and still bears, the title of Lieutenant of the Tower.

When this delegation of authority was fully recognised, Henry VIII. built the present Lieutenant's Lodgings, which occupy the south-west corner of Tower Green, and include the Bell Tower, then one of the chief dungeons. The lodgings were so constructed as to afford not only ample accommodation for the Lieutenant and his family, but also, in addition to the Bell Tower, furnished rooms where prisoners of great distinction could be incarcerated. These prisoners, as well as those in the adjacent Bloody Tower, had the privilege, if they could afford to pay for it, of dining at the Lieutenant's table.

The pay of the Lieutenant was a meagre sum—indeed, only £20 per annum, which the Constable paid him out of his not too princely salary of £100. Naturally the Lieutenant could not live, and was not, in accordance with the customs of the age, expected to live, on that sum; he was therefore allowed to make money in other perfectly recognised ways. One of his chief sources of income was a tax leviable on all prisoners according to rank. This seems a little hard on the prisoner, for not only was he deprived of his liberty, with the block looming on the near horizon, but he had to pay for this privilege. The tax was calculated on the reputed wealth of the prisoner, whatever his rank, at the rate of £2 on every £100 of his income. The Constable's fees, on the other hand, were levied on the prisoners according to rank, so that a duke paid more than an earl, an earl more than a baron, and a baron more than a simple knight. Practically, however, the levy came to much the same thing, for usually the richest persons were those of highest degree. Sir Walter Raleigh was an exception, he, though only a knight, being richer than most peers of his day.

Like the Constable, the Lieutenant was entitled to levy toll on the ships that passed up the river bearing merchandise from abroad. Especially is mentioned that he could claim a 'roundlett of wine,' and 'of daynties a certayne quantitie,' out of these ships, a pleasing latitude being left as to what he might consider dainties, and how much a certain quantity might be held to infer. The Lieutenant also took his share of the fish caught between London Bridge and the Tower, of the cattle that fell off London Bridge, and of the swans which perchance floated down under London Bridge, before they reached their rightful perquisee, who was the Constable. Another source of income was two taverns, or public-houses, as we should call them, which were licensed within the Tower, and of which the Lieutenant was apparently the licensee. These, unhappily for the pocket of the present Lieutenant, no longer exist; but he may have the melancholy pleasure of seeing to this day the iron rod from which hung the sign of 'The Gold Chain,' protruding from the north-west wall of the Bell Tower. Indeed, the tavern was there till comparatively recently, for the

Duke of Wellington, in 1843, gave in it an elegant cold collation to the Yeoman Warders and others.

II.

A prisoner in the Tower, if a man of wealth, could live comfortably. He could order in what he pleased in the way of furniture and even plate and tapestries, but there was one proviso: he could take nothing out of the Tower again. If he went out by way of the scaffold, that mattered not much to him; but if he was acquitted or escaped, his expenditure was a dead loss. All these things became the perquisites of the Lieutenant, from which we may confidently assume that he encouraged his prisoners to make themselves as comfortable as possible, regardless of expense.

Sometimes, however, the Lieutenant met a stone as hard as himself—in other words, a Greek met Greek. Such a one was Sir William Seymour, afterwards Duke of Somerset. This bright knight was lodged in St Thomas's Tower, and though not too well, or indeed at all, blessed with this world's wealth, ordered in expensive tapestries, silver-plate, and the best of furniture, making himself thoroughly comfortable, whilst the Lieutenant rubbed his hands in virtuous anticipation. Sir William Seymour, however, had other views; he intended to escape to France, and was one of the few people who, during many centuries, succeeded in breaking out of the Tower. Noticing that a cart came almost daily to deliver hay and faggots at the main entrance under the Bloody Tower, exactly opposite his prison, he conceived the idea of impersonating the carter and thus escaping. A slouch-hat, a false beard, and a smock having been smuggled in to him by a friend, one day he awaited his opportunity, and whilst the carter was inside delivering his goods, strolled out of St Thomas's Tower, mounted the driver's seat, turned the horse round, and calmly drove out of the Iron Gate of the Tower. There horses awaited him, and riding down the river, he took boat opposite Greenwich, and reached a ship which he chartered to carry him to France.

The Lieutenant naturally got into trouble over this, but consoled himself with the thought of the rich perquisites which Sir William Seymour had left behind. What, then, was his speechless indignation when he found that the fugitive had paid for none of these things, and that he himself was sued by the tradesmen who had supplied them! Even so, he might have recovered at least some portion of his money by the sale of the goods, but, to his intense disgust, he found that the debonair and facetious knight had cut up the most valuable tapestries so as to fit the fireplaces.

If a thrifty man, with a shrewd wife, the Lieutenant could live practically free, for all prisoners who dined at his table paid handsomely for the privilege; in fact, his was an elevated description of boarding-house. Later, however, in the sixteenth century, many of these embarrassing and uncertain means of gaining a livelihood were abolished, at all events discountenanced, and the salary of the Lieutenant was raised to two hundred marks a year. In the sumptuous days of Charles II., though the Exchequer was chronically bare, and all officials found a difficulty in getting any pay at all, the salary of the Lieutenant was raised to the handsome figure of £2500 a year. It is doubtful, however, whether he ever got it, even in arrears, for Sir Allan Apsley, the first to be thus endowed, died a very poor man. In the eighteenth century the Lieutenant's salary fell again to £700 per annum, and in the nineteenth century suffered a further decline, reaching the modest figure of £300 a year, that being the salary which the Lieutenant draws to this day. It is perhaps a meagre dole, but happily in these expensive days a Lieutenant of the Tower is always an officer of high rank in the army, and may well find this small addition to his income not unwelcome.

III.

The first mention of a Lieutenant was in 1274, when Edward I. appointed Giles de Oudenarde to the post, but there is little doubt that the Constable had his Lieutenant before this date. Anyway, Oudenarde is a nice name to begin with, and brings back memories of one of the great British victories won at that village long centuries afterwards, a village which became familiar to us all during the Great War when we searched the map to see how our gallant troops were faring in Flanders. Ralph Bavant appears as the Lieutenant in the reign of Edward III., but after that the records are somewhat obscure for some two centuries, till we come to Sir Richard Cholmondeley, Kt., in the reign of Henry VIII.

We now arrive at stirring times, and the epoch which made the Lieutenant famous in English history. Sir Richard Cholmondeley was evidently a somewhat irascible knight, and also one who greatly disapproved of riots and other popular exuberances, especially if augmented by aliens. It so happened that the Lombards and the English citizens came to blows close to the Tower, as might to-day the Jews of Petticoat Lane have a difference of opinion with the English of Fenchurch Street. Cannons were new toys in those days, and Sir Richard thought this an excellent occasion for trying their effect on turbulent citizens. In pursuance of this idea, according to an ancient chronicler, 'whilst this ruffling continued Syr Richard Cholmley, Knight, Lieutenant of the Towre, no great frende to the citie, in a frantyke fury losed certayn peces of ordinance, and shot

into the citie, which did little harme, howbeit his good wyll apeered.'

During his lifetime Sir Richard Cholmondeley had a very fine alabaster sarcophagus made for himself and his wife, on top of which life-size figures of both lie recumbent. This, his future abode, he could gaze at with pride and affection through many a long and dreary sermon in the Chapel of St Peter ad Vincula, and picture himself at rest within it. But fate ordained otherwise. Both Sir Richard and his wife died and were buried elsewhere, but the sarcophagus still stands, as it has stood for four hundred years, in the chapel on Tower Green.

His successor, Sir Leonard Skeffington, has also left a lasting memorial in the Tower. It was he who invented a new form of torture, which by a rude jest and a slight distortion of his name is known as 'The Scavenger's Daughter.' The great merit of this device apparently was that, whereas the rack stretched the victim till his bones were dislocated, Sir Leonard Skeffington's invention so compressed him that the blood burst from the tips of his fingers.

Sir John Brydges, who came after, seems to have been a kind and humane Lieutenant. To him was entrusted the custody of Lady Jane Grey, the Queen of Nine Days. It was his sad duty first to conduct her husband, Lord Guildford Dudley, to his doom on Tower Hill, and then to return and lead the short procession which conducted Lady Jane Grey to the scaffold on the Green. In his care, too, were placed the three martyr bishops, Cranmer, Latimer, and Ridley, who after sentence were conveyed to Oxford, and there burnt at the stake, near the spot where the martyrs' monument now stands. This, too, was the kindly Lieutenant who received the Princess Elizabeth, afterwards a great and glorious queen, when she was committed to the Tower in Mary's reign. Though a high-spirited and courageous lady, the entrance through the dismal portal of the Bloody Tower quite unnerved her, and falling prostrate, she gave way to bitter tears and lamentation in the drenching rain. It was Sir John Brydges who, with kindly words of encouragement, raised her up, and giving her his arm, helped her to mount the steps to the Bell Tower, where her place of imprisonment was to be. Before he was promoted to his deserved peerage as Lord Chandos of Sudeley, Sir John Brydges was again a principal figure on a historic occasion, for it was he who led forth Sir Thomas Wyatt, the leader of the unsuccessful rebellion against Queen Mary, on his last journey to the blood-stained scaffold on Tower Hill.

Sir Owen Hopton was evidently not so estimable a Lieutenant; indeed, he is described as 'that serpentine person.' He certainly was rather a serpent, for, dressing himself up as a priest, he extracted, under seal of confession, from Charles Bailey such information as the prisoner possessed regarding the Ridolfi Plot in Queen Elizabeth's reign. It seems also fairly clear that he connived at the murder of Henry Percy, Earl of Northumberland, in the Bloody Tower, and treated none too kindly Philip Howard, Earl of Arundel, who was imprisoned in the Beauchamp Tower.

There is a very fine monument in the Chapel of St Peter ad Vincula, made of alabaster, to the memory of two Lieutenants, Sir Richard and Sir Michael Blount, father and son. Their skulls may be seen in two round niches in the monument to this day. Philip Howard, Earl of Arundel, who had all these years been a prisoner, complained bitterly of the harsh treatment he received from Sir Michael Blount. But as he lay on his death-bed in the Tower he sent for the Lieutenant, who, being filled with remorse, asked the earl to forgive him. Forgiveness the prisoner frankly gave, but he added a gentle reproof: 'When a prisoner comes hither to this Tower, he bringeth sorrow with him; then do not add affliction to affliction. Your commission is only to keep with safety, not to kill with severity.' The Lieutenant, like Peter of old, went out and wept bitterly.

IV.

During Sir Walter Raleigh's thirteen years' imprisonment in the Tower he came under many Lieutenants. Some of these were decent enough persons; some, however, were, without the least doubt, quite the contrary. Sir John Peyton was one of the former; he treated his prisoners well and with kindness, and though this may perhaps hardly be counted unto him for righteousness, refused to allow them to be murdered whilst in his charge. He was, for instance, clearly made to understand that should Sir Walter Raleigh unfortunately depart this life whilst in his charge, the rich appointment of Governor of Jersey would be the Lieutenant's reward.

Sir George Harvey, who came next, was also proof against this insidious form of bribery to murder; his wife, too, was exceedingly kind to the prisoner, and supplied Sir Walter with chemicals for his experiments. His next jailer, Sir William Waad, is described with sufficient directness by Raleigh as 'that beast Waad.' He was undoubtedly somewhat of a beast, and treated his prisoners with great harshness and rapacity, but he was no murderer or conniver at murder. Not only did he protect Sir Walter Raleigh against secret assassination, but also stood out stoutly against similar temptations to allow foul play in the case of Sir Thomas Overbury, another prisoner in the Bloody Tower. Indeed, he lost the Lieutenancy through this inconvenient fastidiousness.

His successor, Sir Gervase Helwyss (or Elwes), seems to have been more amenable to subtle persuasion. He owed his appointment to the influence of the Earl and Countess of Somerset,

and was, there seems little doubt, a complacent tool in their hands. The Somersets, especially the countess, loathed Sir Thomas Overbury with a murderous hatred for objecting to their marriage, and left no stone unturned to compass his death. The Lieutenant was merely invited to be complacent, and not to ask inconvenient questions regarding those who visited or remained in attendance on his prisoner. The road thus cleared, a gang of poisoners was employed by the Somersets and set to work—in somewhat clumsy fashion, to be sure—to bring about the desired result. Evidently the art of poisoning, however perfect in Italy, was in England in its infancy; moreover, Sir Thomas Overbury appears to have been a person with a singularly tough interior. The gang poisoned their victim's food; they poisoned his wine; they mixed arsenic with his salt, and added cantharides to his pepper. But though ill, still he survived. Then they tried lunar caustic with his pork, whilst aqua-fortis, mercury, powdered diamonds, and ground spiders were judiciously mixed with other articles of food. But still he lived. Finally, on the night of September 14–15, 1613, they applied a clyster to his stomach, and that finished the poor gentleman. It is gratifying, however, in the interests of justice, to be able to record that even in those far-off days life could not be taken with complete impunity. In due course all the actors in this drama were brought to justice. True, the Earl and Countess of Somerset, the countess being the real villain of the piece, escaped with imprisonment in the Tower and the confiscation of all their worldly goods, but the Lieutenant of the Tower was hanged, perhaps even higher than Haman, on Tower Hill; whilst the active agents who actually perpetrated the deed were hanged, drawn, and quartered at Tyburn.

Sir Allan Apsley was, again, a straight Lieutenant, who would have no dealings with those who wished to effect the disappearance of obnoxious State prisoners, of whom Sir Walter Raleigh was to James I. the chiefest and most obnoxious. He was, therefore, told to hand over temporary charge of the prisoner to a willing but perfidious knight, Sir Thomas Wilson. Sir Thomas did his best; but Sir Walter was an old and wary bird of the world, and soon gave his brother-knight to see quite clearly that even in prison he could guard himself against knife and poison. Sir Thomas Wilson retired discouraged, and Sir Walter Raleigh was later judicially murdered as is in history duly related.

A somewhat interesting Lieutenant, from an entirely different point of view, was Sir John Robinson, who was the first to be appointed by Charles II. on his restoration. Sir John was not only Lieutenant of the Tower, but also combined the office, temporarily, with that of Constable, and he was at the same time Lord Mayor of London, a very curious and unique position, which demonstrated the king's political acumen. He had at least two celebrated prisoners in his charge. One was George Villiers, Duke of Buckingham; and the other, William Penn, founder of Pennsylvania—may not this indiscreet disclosure bring on another war with America!

When Captain Thomas Cheek was Lieutenant occurred again one of those suspicious tragedies which gained the Tower so unenviable a reputation. A noted prisoner, Arthur Capel, Earl of Essex, occupied apartments, as had Lady Jane Grey, in the yeoman jailer's quarters on Tower Green. One morning a yeoman's child, going to school, heard a maid, who had rushed out from the yeoman jailer's quarters, screaming, 'Murder! Murder!' The child raised the alarm. Outside the yeoman jailer's quarters on the Green was found a bloody razor, and inside was found the Earl of Essex with his throat cut. A complacent coroner's jury found that this was a case of suicide, but public opinion agreed with the servant-maid.

The Lieutenant who had the honour and distinction of being chief jailer to James, Duke of Monmouth, was Sir Edward Hales. The duke was imprisoned in the Bell Tower, which forms part of the Lieutenant's Lodgings, and there, after his execution, with his head laid in life-like position next his severed body, his mortal remains awaited, till next day, burial beneath the altar in the Chapel of St Peter ad Vincula. The picture of the dead duke on his pallet may be seen in the National Portrait Gallery.

V.

The last Lieutenant to reside permanently in the Tower was Sir Bevil Skelton, and this was as long ago as 1689; for it is recorded that 'since the flight of James II. the Lieutenant was not expected to reside in the Tower, his duties falling upon either a Deputy-Governor or Major of the Tower.' Thus did the Lieutenant lightly abandon his heritage, and the beautiful old Tudor house which served as his lodgings. The Major, on the contrary, who has now occupied them for more than two hundred years, naturally thinks this a very good arrangement. But not improbably every Lieutenant since Lieutenant-General Hatton Compton, who was apparently the gentleman who did the deed, has heartily cursed him.

Both the Constable and the Lieutenant nowadays greatly covet these wonderful and historic old quarters, but the Major has two centuries of precedent at his back. With the lodgings rent free, £500 a year, and free coals and lighting, this is a royal bounty by no means to be despised in days of high rent, with coal and electric light matters of luxury. The Lieutenant, however, still retains the right to occupy these lodgings for two months in the year, a right which during the war was not exercised by

the then Lieutenants. The appointment is nowadays always given by the King to a distinguished officer of high rank, and is tenable for four years only. There have been probably nearly as many Lieutenants as Constables, but there are only sixty-four Lieutenants of whose appointment record can be traced. Perhaps it may be of interest to mention some of the more recent ones: Lieutenant-General Lord Chelmsford, Lieutenant-General Sir George Higginson (who is over ninety years of age and still alive), Lieutenant-General Sir Godfrey Clerk, Lieutenant-General Sir William Stirling, Lieutenant-General Lord William Seymour, Lieutenant-General Sir George Luck, Lieutenant-General Sir Robert MacGregor Stewart, Lieutenant-General Sir Henry Grant, Lieutenant-General the Hon. Sir Frederick Stopford.

During and after the Great War three Lieutenants of great distinction held office: General Sir Horace Smith-Dorrien, General Sir Ian Hamilton, and the late holder, Lieutenant-General the Earl of Cavan.* In the long list of Lieutenants, running back for nearly seven hundred years, rarely has any been more worthily honoured with this high distinction than the Earl of Cavan. When the Great War broke out he was a comparatively junior officer on the retired list, but at once joined up, and was shortly after given command of a battalion of the Irish Guards. Throughout the war he was consistently successful, and showed the highest qualities of a commander; so that he rose rapidly, first to the command of a brigade of Guards, then to the command of the Guards' Division, and finally to command of the 14th Army Corps. Not only, however, was he a commander and general of the first order, but he endeared himself to all ranks by exhibiting under all circumstances, in stress and storm as well as in sunshine, those characteristics which endear an officer to his men. There is probably no more popular officer in or out of the army than the late Lieutenant of the Tower.

VI.

The Lieutenant's Lodgings, the designation of which has, for some reason unknown, in late years been changed to 'King's House,' are not open to the public, but the building is a wonderful old place, and a little diplomacy may secure a view of it. The Bell Tower, which stands included in the Lieutenant's Lodgings, has two great circular dungeons, one above the other, in which many a prisoner of high importance has been imprisoned—amongst these such historic persons as the Princess Elizabeth, afterwards the great and glorious Queen Bess, and James, Duke of Monmouth, son of Charles II., one of the most popular and romantic figures in history. On the walls of this tower has been engraved by some unknown hand the cry of the racked and tortured, a voice from the dead speaking through these old walls:

BI · TORTVRE · STRAVNGE · MY · TROVTH ·
WAS · TRIED · YET · OF · MY · LIBERTY ·
DENIED : THER · FOR · RESON · HATH ·
ME · PERSWADED · THAT · PAYSENS ·
MUST · BE · YMBRASYD · THOGH · HARD ·
FORTVNE · CHASTYTH · ME · WYTH·
SMART · YET · PAYSENS · SHALL ·
PREVAYL ·

Upstairs in the western wing is the little chamber where Queen Anne Boleyn spent her last days, and over the fireplace is the roughly engraved word 'Anne.' In another little room may be seen an inscription carved by the servants of Lady Margaret Douglas, Countess of Lennox, who was here imprisoned for allowing her son, the Earl of Darnley, to marry Mary Queen of Scots. In an upper room, known as the Council Chamber, Guy Fawkes was questioned, as it was called, between the intervals of being tortured; and here are some very flattering, if somewhat inflated, inscriptions extolling James I. of England and VI. of Scotland. He is described as 'illustrious for piety, justice, foresight, learning, hardihood, clemency and all other regal virtues.' These tablets, as well as a bust of James I., were put up at the expense of Sir William Waad, the Lieutenant, in this chamber. From the Lieutenant's Lodgings Lord Nithsdale made his celebrated escape, disguised as a woman, by the aid of his wife, on the very night before he was to have been executed on Tower Hill. He had been sentenced to death for participation in the Jacobite rising in favour of 'James III.' in 1715.

The last prisoners of distinction to be imprisoned in the Lieutenant's Lodging were the Scottish lords who took part in the rebellion of 1745. The Marquis of Tullibardine died in the Tower before his trial, and 'by his brother the Duke of Athol's request he was decently, but at as small expence as could well be, interd in the West end of our Chapple in the Tower.' The Earl of Kilmarnock and Lord Balmerino were tried, sentenced to death, and beheaded on Tower Hill. Simon Fraser, Lord Lovat, was captured later, and at the age of eighty met the same fate. He was the last person ever to be executed on Tower Hill, and the date of his execution was 9th April 1747.

If some great novelist, of the quality and genius of Sir Walter Scott, is in want of a theme, he could find none more full of the most thrilling incidents than are on record of the Lieutenant and his Lodgings. *The Tower of London* and *The Constable of the Tower* have become classics, but perhaps a future book entitled *The Lieutenant of the Tower* may yet equal or surpass these.

* The Earl of Cavan's successor had not yet been appointed at the time of writing.

THE TWO-STREAM POLICY.

By E. A. THOMAS, Author of *A Daughter of the Doppers.*

PART I.

I.

IN the triangle formed at the junction of the Riet and Modder rivers, which covers an area extending from the apex thereof in the district of Kimberley well into the Orange Free State, lived Douglas M'Kay and Klaas Mostert. Their farms, of over nine thousand *morgen* each, ran contiguously, and were divided by a wire fence which met the base line—also securely fenced—midway between the two rivers. Both M'Kay and Mostert were enterprising farmers of substantial means, the former perhaps a little more so than the latter; and their regard for each other was of such a character that events which would have strained the relations that in ancient times existed between Damon and Pythias were unable to place their firmly established friendship in jeopardy. The battle of Magersfontein, so disastrous to those of M'Kay's blood, and the capture of Cronje at Paardeberg, so grievous a disappointment to Mostert, served only to strengthen the sentiment which united them. Both these soul-stirring events took place a short distance from their homesteads, and together they visited Modder River station and Cronje's broken laager, their wagons loaded with farm produce as a free offering to valour in distress. The political disputations of the loyal M'Kay and the republican Mostert were numerous and sometimes serious; but, after vehement words and gestures, they invariably ended as they began—in harmony.

M'Kay's homestead was well placed on the left bank of the Modder River, while Mostert's occupied a sheltered spot on the right bank of the Riet, near a drift through which a road ran to the little village of Jacobsdal, in the Free State. Each was surrounded by flourishing orchards, and bore other evidence of the enterprise of its owner. In this same enterprise appeared their one source of rivalry. They lavished judicious care on the breeding of horses and cattle, and flourished the prices they obtained in each other's faces with the glee of schoolboys. This led not only to efficiency in their methods far in advance of that of their neighbours, but to such excellence of quality in their stock that buyers came from all parts of the Union to purchase their horses, oxen, and pedigree cattle. They had their anxieties, of course. There was the fear of horse-sickness and rinderpest, and, of greater importance, the uneasy solicitude for the future of the children—the boy and the girl for whom they were buying and selling, planning and building. The boy was the fine, upstanding son of Oom Duggie M'Kay, the girl the pretty daughter of Oom Klaas Mostert—each an only child.

The charming reader of this veracious narrative—for the unworthy narrator hopes that many of the fair will peruse it—curls her pretty lip in derision of the primitive methods of the writer. The introduction of the young people is so obviously a contrivance in the interests of pure sentiment, leading to the usual crude finale of orange-blossoms and wedding-presents, that the device, she thinks, is a glaring insult to her intelligence. Let her smooth her pretty mouth to its normal allurement; this is a veracious history, faithfully, if imperfectly, recorded.

One warm morning in December the two old friends met—as they often did—at the fence dividing their farms.

'Morning, Duggie,' said Klaas.

'Morning, Klaas,' responded M'Kay. 'Did you see your dog chase a *duiker* [diver] buck up to the fence? It wriggled through underneath the lowest wire, and is now on my land.'

'I did,' replied Mostert; 'and I heard the buck bleat "Scotland for ever!" when it was safe on the other side. It is a good job that the springbok can't get through, as, with the usual luck of the Scotsman, you 'll soon have all my game on your land.'

'Believe me, Klaas, you Dutchmen know how to take care of yourselves,' laughed M'Kay. 'Do you know what the Americans call a South African bale of wool?'

'No! What?'

'Dutch courage,' replied M'Kay.

'Dutch courage!' repeated Mostert. 'But why?'

'Because of all the "grit" they find in it,' replied Oom Duggie.

Oom Klaas laughed heartily for some time. 'Duggie, did you ever hear the story of the Scottish contractor in Du Toit's Pan Mine?'

'No. What about him?' inquired M'Kay, scenting retaliation.

'He contracted to remove some thousands of tons of débris that had fallen into the mine, and hired a couple of hundred Kaffirs to do the work at half-a-crown a day. Regularly every Saturday he paid each individual six florins for his six days' work, and persuaded the simple barbarian that they were half-crowns. At last the murder was out, and your countryman bolted across the Free State border, where he was safe; but to this day a Kaffir calls a two-shilling piece a "Scotzeemaan."'

'A fair return, Klaas,' laughed M'Kay—'a fair return. But let me ask you this. To whom does that *duiker* now belong?'

'To me, of course,' replied Mostert. 'It was

on my land, and simply took refuge on yours when it was chased by the dog.'

'How do you know that it didn't, on some previous occasion, transfer itself from my ground to yours?'

'We can only go by what we see,' replied Mostert.

The two old friends looked at each other for some moments in silence, and then M'Kay said, 'What a pity it is that this fence is here at all! I hope to see it removed before I die.'

'I also should like to see it disappear, but that would mean a sale by one of us to the other,' said Mostert.

'I won't sell,' said Oom Duggie.

'Neither will I,' said Oom Klaas.

They looked at each other again, and their eyes twinkled.

'If only,' remarked M'Kay, 'my boy Donald and your sweet little Nettie would take to each other, this fence's days would be numbered.'

'Yes, old friend, quite true. Donald seems friendly, but my Nettie holds herself aloof. It is all on account of that infernal two-stream policy. It is in full flood at Stellenbosch, where she was educated. Van Buren, the man who enunciated it, has a lot to answer for. I am a republican, as you know, but I do not hold with it.'

'Have you ever spoken to Nettie about it?'

'No. She does all the talking. She says, and says it firmly, that on no account will she marry a man who is not a Dutch South African.'

'You don't know how to handle her, Klaas. If you want a woman not to do a thing, praise that thing up to the skies. Applaud Nettie's two-stream sentiments, and tell her as forcibly as you are able—striking your right fist into your left palm with a smack—that you would rather die than see her married to a man of British descent, mentioning my Donald as an example. If all the Governments of the world passed a law abolishing matrimony, you would hear no more talk of free-love; every woman and man would rush to get married. The human animal loves to go agin' the law.'

'Duggie, you are a man of much wisdom, so I'll follow your advice. Tell Donald to come over to us as often as possible, and I'll tell Nettie after a while that I shall have to forbid him the house, as I know that his attentions are distasteful to her. *Tot weder ziens* [So long].'

II.

'This awful drought is working havoc with my veld, so I have asked some men from Kimberley for a day's shoot. The springbok are eating up the little grass there is, and my cattle are, in consequence, getting very low in condition. That ass Van Plank is coming. Nettie insisted on my asking him. He is a university man, and a very good analyst, I believe; and as a game shot he is dangerous—but not to the game, Duggie; not to the game. I shall keep out of his way.'

'So shall I,' said M'Kay. 'When is the shoot coming off?'

'Next Thursday,' replied Mostert. 'Hang that fellow Van Plank!'

'If Nettie is so keen on having him down, it looks uncommonly bad for our scheme. He is floating in the Dutch stream, you know. Have you cracked up the two-stream policy to Nettie as I asked you to?'

'Yes—hot and strong,' replied Mostert.

'Any results?'

'I think I can say with truth that she is not quite so bitter as she was. There is a slight change. Her two-stream temperature is a little lower, and the pulse is not quite so rapid.'

'Good old Klassie!' said M'Kay in approval. 'Keep it up, old man. But what makes you think so?'

'For one thing, she appears to be the tiniest degree upset because your Donald has not been to see us for over a week. It is a very good sign that she has noticed it. When I said that his visits were unwelcome to me because I was sure that he had his eyes on her, and that no man of British descent could ever hope to become my son-in-law, she became warmish, and remarked that the two-stream policy did not exclude friendship.'

'That was a good stroke of mine,' said M'Kay—'keeping Donald away. The yeast is working, Klaas, my boy. The standards of that fence are trembling in their—in their—thingumbobs.'

The shoot was a brilliant success, and was rendered all the more enjoyable to at least two of the party by an early and providential catastrophe. Van Plank's horse, urged blindly on by its clumsy rider, put an unwary foot into an ant-bear hole, and so the catastrophe followed. Van Plank described three perceptibly separate somersaults in the air, landed on an ant-heap, and collapsed with the hue and expression of a disgorged aeronaut. He recovered sufficiently to take his share that evening of the viands at the supper-table, and more than his share of the conversation which followed that delightful meal. He was an interesting casualty—at least so thought Nettie Mostert, for she was markedly sympathetic, entertaining him with sprightly words and a vivacious air, with an occasional—very occasional—sly glance at Donald M'Kay.

'My husband's weakness is tobacco,' said Mrs Mostert.

'And my husband's game-pie,' said Mrs Brink.

'And my husband's handkerchiefs,' Mrs M'Kay chimed in. 'He has one of each colour in the rainbow, and many that the rainbow has not got.'

'Every man who calls himself a true man has a weakness of some sort. Mine has, at all

events, the virtue of variety, and variety is a far more satisfactory virtue than all the others put together. Want of variety is the only fault that I find in the two-stream policy. It is too fixed —too rigid. The two streams are going to run in two parallel straight lines to infinity. Otherwise it is an excellent idea.' M'Kay looked at Nettie as he finished.

'What is this two-stream policy that I have heard so much about?' inquired the manager of the Standfast Bank.

'It is a policy,' replied Van Plank, 'laid down by our great leader for the guidance of the Dutch Africanders. He says that there is no reason he knows to prevent the Dutch and the British in this country from living in amiable propinquity for all time, the Dutch stream side by side with the British stream, flowing in amity into the unknown future, each section respecting the other, each proud of its particular traditions, history, customs, and manners. Why should these noble ideas be condemned, as they have been by a portion—a small portion, I think—of the inhabitants of our great country?'

'The simile, to my mind, is rather a weak one,' said the bank-manager. 'Who ever saw two streams running together in that fashion like a railroad? They are bound either to unite or to part from each other. For them to flow together in parallel courses is against all stream law.'

'My revered leader said nothing about parallel lines,' said Van Plank. 'There is no reason why they should not wind in and out, so long as they remain side by side and don't mingle.'

'Does all this mean that intermarriage is prohibited?' asked the bank-manager.

'Most certainly!' pronounced Van Plank vehemently, with a glance at Nettie.

'Decidedly so!' exclaimed Oom Klaas, dropping the lid of his left eye. 'With all respect, Duggie; with all respect.'

'Don't mention it, Klaas; I agree,' said Oom Duggie, obscuring his right eye for his friend's benefit.

'But what is it all going to lead to?' inquired the Head of St John's School, Kimberley. 'You cannot lay down a law or pronouncement like that and expect it to be adhered to. Chance, temptation, opportunity, ambition, jealousy, and many trifles light as air may knock the two streams into one at any time, or lead them away from each other with disastrous results. America didn't bother about such matters; she welded all her conflicting human elements into one powerful whole capable of defying the world.'

Oom Klaas favoured Oom Duggie with an encouraging wink. They both looked at Nettie, who caught their glances and blushed slightly.

'A man of British descent,' she said, with an entire absence of enthusiasm, 'should seek a wife among his own people. Why should he desire to marry a Dutch girl?'

'Cupid,' replied the Head, 'and sometimes cupidity—human nature being what it is. Whenever this subject is discussed in my presence I am reminded of those beautiful lines of Longfellow's:

> The watershed of Time, from which the streams
> Of Yesterday and To-morrow take their way,
> One to the land of promise and of light,
> One to the land of darkness and of dreams.

If your two streams turn away from each other, which one will flow to the land of light and which to the land of darkness, both stained with blood and fed with tears?'

Nettie seemed absorbed in the speaker's words. There was that look in her eyes which one sees in those of a young child viewing a beautiful object for the first time.

Van Plank observed the look, and said harshly, 'All the same, there is no reason against the two-stream dictum holding good for all time. Oil and water cannot mix.'

His tones roused the girl from the reverie into which she had fallen. She spoke tartly. 'I am sick of this eternal two-stream business. My ears are bombarded with it every day.—Come on, Donald; let us go down to the river. It is a beautiful moonlight night.'

Van Plank stared in undisguised surprise at her sudden change of front. 'I am sorry,' he said lamely, as Donald and Nettie left the room. They passed Oom Duggie and Oom Klaas, who were smoking a friendly pipe on the *werf* (farmyard), which the effulgent rays of the moon had converted into a space of brilliant light, and strolled on to the river.

'The Modder River is running strong just now,' said Oom Duggie.

'The Riet is also rising,' said Oom Klaas solemnly.

(*Continued on page 31.*)

SOME CURIOUS WAYS OF EARNING A LIVING.

By Clive Holland.

PROBABLY in no city in Europe are there more strange methods of earning a living to be found than in Paris. Indeed, it would seem that there must be something *bizarre* in the nature of the Parisian which predisposes him to adopt the most extraordinary means of gaining a livelihood when other more usual methods fail—means which, we imagine, would not appeal to the ordinary mortal.

The dog-washers, who ply their trade of cleans-

ing and beautifying the pets of the *bourgeoisie* and the *beau monde* of Paris along the *quais* by the Seine, are known to most tourists; and their operations seldom fail to attract a little crowd of idlers. Fido's toilet, including a bath with use of scented soap and towels, with hair curling and clipping, may cost anything nowadays from a franc to three and even four francs. In the case of the pampered favourites of fortune, such as poodles and other close-clipped dogs, the use of scented sachets for the bath-water is by no means an unknown 'doggie' luxury. This will frequently add a couple of francs or even more to the bill.

Far removed from the prosperous dog-barbers, who, almost without exception, seem fat and flourishing, with a cheerful outlook on life, are the unkempt tatterdemalions who haunt the precincts of cafés and restaurants, with the object of picking up unconsidered trifles in the shape of cigar and cigarette ends, and the tiny plugs of tobacco raked from pipes. With their crooked sticks, carrying bags slung over their shoulders, or, failing these, possessing capacious pockets, they rake beneath the little tables which line the boulevards, and announce with a grunt of satisfaction the finding of a cigarette or cigar end of greater than usual proportions. Strange as it may seem, these often weird-looking beings have grades in their trade, and there is a social distinction between the *trimadeur* who searches for these odds and ends of tobacco outside the big cafés of the Grand Boulevards and the *chiffoniers* who rake amongst the rubbish of the gutter with the same object, or frequent the low-class wine-shops of the poorer quarters and by-streets.

The professional mourner is a greater institution in Paris than in London; and, let it be remarked, he is a far more finished actor. There are men—the present writer has talked with one of them—who for the past forty years have done nothing to earn a living but mourn, at so many francs a time, for people with whom they were generally entirely unacquainted. Their great ambition seems to be to attend big funerals, and those who succeed in gaining employment at a funeral of any note are quite princes in the trade. For two or three francs many of these men will walk beside the hearse, looking as though the world were indeed a dreary wilderness, and the departed their dearest relative or friend. Watch them in a cemetery, and one realises how undoubtedly the dramatic gift is theirs. Attitudes and expressions are irreproachable, and if at such times the real mourners should note a thing of this kind, they cannot but feel that the money has been well earned.

There are several of these professional mourners in Paris who have grown quite rich from affected grief. One died not many months ago, leaving upwards of one hundred and fifty thousand francs invested in *rentes* and similar securities. Even the meanest mute who attends only second and third class interments may reckon, if his connection with the undertakers is a good one, to get a living at his lugubrious profession. Three francs and something of a meal is probably the lowest fee that self-respecting mutes would take, whilst twenty francs and a good feed is considered a very fair morning's or afternoon's remuneration.

Paris is a city of fairs, and during the year there are so many in and near the French capital that a large number of people find employment in connection with them.

Some years ago we made the acquaintance of a man whose sole apparent means of livelihood was the eating of an enormous quantity of a certain make of dainties not unconnected with the pork trade, so as to induce buyers to purchase. He used to be invariably seen at the stall eating! eating!! eating!!! and loudly proclaiming the delicious nature of the repast. To some people it might appear that the proprietor of the stall's ingenuity was of a somewhat unnecessary and expensive character, and that if the goods were worth anything they ought to have sold themselves. But that he found the services of *L'Homme qui Mange* (the eating man)—as the Parisians nicknamed him—valuable was vouched for by the fact that the Gargantuan eater travelled with his employer the whole round of the fairs, attending not only those in Paris and its environs, but even those farther afield in the Departments. How many meals this unfortunate man must have eaten without the shadow of an appetite is simply appalling to think of, but he seemed to flourish amazingly at his queer trade. He ultimately took a post in one of the travelling shows, and spent the remainder of his life, until his death about two years ago, sitting in a huge chair on the platform in front of the booth to exhibit his great bulk to the crowd. From being a man of ordinary weight and proportions, he became in the course of ten years enormously stout, and at the time we saw him last weighed the equivalent of twenty-three English stones, which, for a man of five feet eight inches in height, was considerably more than he should have done.

A more congenial trade is that of the trainer of singing-birds, who usually, though not always, lives in some little cottage possessing a garden on the outskirts of Paris. At St Denis there are several of these men, whose mission in life is to train birds to sing for the bird-fanciers; and in fine weather, if one is fortunate enough, one will hear human but bird-like warbling proceeding from one or other of the dwellings of the bird-trainers. The sounds are—feebly and imperfectly at first—imitated by the birds, which, however, in the end learn to sing, and thereby have their value greatly enhanced. The bird-trainers make quite a good income at this work, either by catching and training the

wild birds and selling them, or by doing what is more usual, when capital is small—training at so much per head birds supplied them for that purpose by the various bird-dealers in Paris.

One of these men once said, 'I can whistle nearly every note of most singing-birds so well as almost to deceive the birds themselves. It has proved a valuable accomplishment to me, for it has enabled me to earn a comfortable living in a comparatively easy way. A canary, for example, which does not sing is worth but a few francs, but a bird that sings as I teach it to do is worth ten times as much. I have often bought for two or three francs apiece birds which, after training, I have sold for thirty-five and even as much as fifty francs.'

But all strange trades in Paris are not so innocent or so praiseworthy as the bird-trainer's. There are other trainers, well known to the police, who take children when quite young, and teach them all the dodges which go to the making of expert thieves.

This training of thieves and desperados is quite a recognised profession, and those who follow it are many of them apparently, to judge from their conversation, as proud of having trained an expert thief as another might be of training a champion athlete or a successful racehorse. Although many steps have been taken from time to time to put down this iniquitous profession, it still flourishes more or less according to the activity and knowledge of the police in the lower parts of Paris.

But there is yet another gruesome and disreputable calling which is probably more followed in Paris than in any other European city, save, perhaps, Naples.

There are quite a number of men and women who train young children to be deformities, either for the purpose of selling them to shows or 'freak' museums which visit the various fairs throughout France, or that they may by their deformity gain the more easily a livelihood by means of begging. Quite a number of children are undoubtedly deliberately deformed each year in Paris for one or other of these purposes.

Their limbs are bound to their sides until they become withered and useless, or their legs are twisted when quite young so that they can be easily dislocated. In some cases, of course, these artificial deformities are only temporary; that is to say, a child one sees walking on its knees with its legs from its knees downward bent under it and apparently useless, crying out for alms 'for the love of God,' may later in the day and at night be seen up on Montmartre walking very much as another person would do.

Many of the Paris beggars, indeed, are wonderful impostors. Limbs which seem twisted beyond all possibility of use will be straightened and used when the owners have retired from the public eye at the end of their day's begging. But it is needless to say that all child deformers must be possessed of horrible instincts, and that most terrible cruelty is often practised in connection with the deforming process.

Then one other trade, not confined to Paris, but very much in evidence in the French capital, is that of the professional awakener. There are a number of people living in lodgings or in studios who cannot rely upon themselves to wake up at a reasonable time in the morning, and are thus willing to give some one half-a-franc or so a week to come and call them regularly at some time decided upon.

One old lady who lives in the Luxembourg Quarter has not only kept herself comfortably for the past thirty years as a professional awakener, but in a confidential moment admitted that she had saved not a bad nest-egg for the day of adversity or old age.

THE SPY WHO BLUNDERED.

By S. T. Felstead, Author of *German Spies at Bay*.

I.

THERE is in the Strand a fashionable hotel—for present purposes it may be called the 'Lombardy'—that attracts all the wealth and beauty arriving in our great metropolis, especially from across the Atlantic. Well-to-do Americans have come to regard it as their headquarters while in London.

Fame of another description came the way of this luxurious caravanserai during the war. Unknown to the proprietors, many German spies who came to this country in 1915 and 1916 installed themselves as guests. Most of these individuals were posing as American citizens, and as such were able to move among the beautiful women and well-dressed men who hailed from the States, without evoking the slightest suspicion that they were engaged on an espionage mission for the German Secret Service. This was the time when we were occupied in combating the efforts of a stream of spies of German-American ancestry who were then being recruited in the United States by Count John Bernstorff, the German Ambassador at Washington.

II.

Charles (or, to be strictly accurate, Carl) Hansell, newly appointed German spy, followed the crowd of chattering Americans down the gangway of the big Cunard liner at Liverpool, feeling on excellent terms with the world at

large. Everything had gone well on the trip across, and he had little doubt that his flying visit to England as a traveller in timber would enable him to get away to Copenhagen with the naval information the Germans so badly wanted. So it was with comparatively few qualms that Charles passed through the ordeal of having his cleverly forged passport examined and *viséd*—proof number one that the English were too thick-headed for anything!

With the first trick, that of entering the enemy's country unsuspected, to his credit, an ordinary man might well have been content. But already Mr Hansell's head was beginning to swell, and when some of his fellow-passengers asked if he were going to put up at the 'Lombardy,' he answered, 'Sure!' in his best American accent, in which the German was barely distinguishable. Quite a gay little party travelled up to London, with invitations to lunches and dinners flying all over the place. Mr Hansell accepted all that came his way, although he forgot for the time being that he was not possessed of an inexhaustible supply of ready money. And that was the beginning of a series of blunders which were to land the amateur spy in a chair at the Tower of London, with a firing-party of eight Guardsmen to keep him company—temporarily.

It soon dawned upon Charles that the gay and expensive life of a fashionable Strand hotel could not be continued long on the miserable pay of a German spy. And here Charles made blunder number two. He did something he had been warned not to do except in a case of the direst extremity—that was, to write to some one in Rotterdam asking for money immediately. It was not the actual money which the Huns minded, but the risk involved; for of late the British had had the impertinence to make all sorts of inquiries in Rotterdam and Amsterdam as to what business was carried on at certain addresses. However, Charles had no option but to get money from somewhere.

Obviously it would be at least a week before a reply could come, so he took the opportunity to make a trip to Scotland, promising himself, as he counted out the fare from his meagre supply of ready cash, that, once out of England, he would take good care not to return. As a traveller in American timber Charles possessed an excellent excuse for making inquiries around shipbuilding-yards, and he thought that with luck he could collect enough information to satisfy the master-spy he was to meet in Copenhagen, and thus get the thousand dollars Count Bernstorff had promised him. After that, no more! Spying on the spot, in the heart of an enemy country, was not the simple matter it had appeared in Count Bernstorff's luxurious office in Washington. Living at an Americanised hotel in the Strand among people he knew was one thing; moving around the country with an accent which did not seem particularly popular, with very little money in his pocket, was another. So it was with something of a heavy heart that the spy boarded the train at King's Cross on his long journey to the north. And that was blunder number three—although certainly Charles could not be expected to know the precise psychological moment when he committed these *faux pas*.

In the particular carriage where the spy took his seat there happened to be ensconced in the corner a Scot, homeward-bound after many years in Canada. A genial soul, he had no difficulty in opening up a conversation with Charles, who was only too willing to talk to anybody and everybody. By the time the train had reached Doncaster the acquaintance had ripened fast. Charles had told his life-story—the one provided for him by Count Bernstorff; the Scot had related the story of his struggles in Canada, and of his return to his native land in the hope that he might be of assistance against the Germans. Charles had expressed his sympathy in suitable terms, and hoped that it might not be long before the 'damn Huns were thoroughly beaten,' adding that he, too, hoped to be of help to the Allies, as he was going to the big shipbuilding centres to offer large quantities of timber for sale. And that was blunder number four; for the Scot was one of the lumber-kings of Canada, and knew, to his sorrow, that the capacious maw of the Defence of the Realm Act had long ago seized all such profitable commodities. But, being a Scot, he said nothing to Charles.

III.

About the time that Charles Hansell was playing the German spy there had come into existence in the British contre-espionage service a 'black book.' In actual fact it was a register of addresses in Holland, Denmark, Sweden, and Switzerland where mysterious people lived, men and women without any visible means of livelihood.

To the postal censorship one day there came a letter to Holland which said that business was good, and would they be kind enough to forward the writer an immediate remittance of fifty pounds? Being suspicious of people who asked for money from Holland, we looked up our 'black book.' Undoubtedly an agent of the German Secret Service, was the report. Investigation at the source of the letter proved less reassuring than ever. Mr Hansell was an American gentleman, but was absent in Scotland for a few weeks, present address in that land not being known. And, worse still, at the American Embassy they knew nothing of Washington having granted any passport to such an individual, but would make inquiries by cable.

Fate was weaving its web fast around the

unsuspecting German spy. He had duly arrived in Edinburgh, and had been visited by the Scottish police, who, primed with the suspicions of the spy's travelling companion, had cross-examined him with a thoroughness that had made him squirm. However, they said nothing as to whether they thought he was a German spy, so Charles plucked up enough courage to make a flying trip to the Clyde, where he picked up all sorts of useful information concerning new warcraft. Quite unbeknown to himself, Charles was accompanied by an untidy-looking 'Geordie,' who slouched around whispering here and there, with the result that a surprising amount of news came Charles's way. Had Charles known the Scottish character better he might have suspected this untoward loquacity; as it was, he told himself the British were even bigger fools than Count Bernstorff had said. He even thought of reconsidering his decision of abandoning the profession of spy once he had seen the master-agent in Copenhagen.

Two apparently profitable weeks did Charles spend in Scotland. By the end of that time he had collected a complete record of everything the British Navy was about to do in the immediate future. Like a wise man, he had not attempted to send any of this information off by letter; he was keeping it in the form of minute marks on his underclothing. Apart from the risk attached to sending such things through the post, Charles knew by bitter experience that you could make a much better bargain by not parting with anything before you got the money.

There were many letters awaiting the spy when he returned to his hotel in London. Eagerly did he go through the packet handed to him at the bureau, and hastily open one bearing a Dutch stamp. It contained the remittance so badly wanted, and it bore no sign of having been opened. It was not for Charles to know that our contre-espionage had recently perfected a method of reweaving the paper of a slit envelope (though paper so treated shows a little thin if held up to the light). The spy's correspondent said little of importance. He was glad to hear Mr Hansell was well, and hoped that he might soon have the pleasure of seeing him in Rotterdam. Charles got a nasty shock which quite destroyed the pleasure of the previous letter when he opened one which proved to be from the American Embassy in London. It said that there appeared to be some little error in his passport; would he please bring it to the Embassy as soon as possible? It was a most uncomfortable night that Charles spent in his luxurious bed at the 'Lombardy.' The fact that the English police had not communicated with him was fairly comforting; evidently his real mission was not as yet suspected. So at ten o'clock the following morning he made his way to the Embassy in Grosvenor Gardens, where an official informed him that his passport was wanted to check the *visés;* he would get it back in a day or two.

IV.

Charles had a feeling of being between the devil and the deep sea as he left the Embassy and thoughtfully made his way up Victoria Street. Thoughts of flight crossed and recrossed his mind, with the firm conviction that he would have to hide somewhere in England.

Somehow or other he got through the day, and spent another miserable night wandering about the streets, getting to bed at three o'clock without anything having happened. With the morning he made up his mind to get out of London, chancing whether he would be caught for registering himself in a false name.

While Charles was deciding his movements other people were making different arrangements. The spy's forged passport and copies of his Dutch correspondence were in the hands of the contre-espionage.

Just about the time when the people in evening-dress were leaving the restaurant of the 'Lombardy,' two detectives from Scotland Yard quietly entered the hotel and made their way to the manager's office. As a result of the colloquy which took place the three men made their way to the third floor. Mr Hansell was busily engaged packing a bag when the party entered. As one of the detectives told him he would have to come to the police-station his hand gradually stole down into the bag beneath some clothes, but before he could withdraw it the two police dashed at him and bore him backwards, struggling like an infuriated tiger.

Charles Hansell did not succeed in evading the customary fate of the unsuccessful spy. He confessed everything, it is true, and even offered to make his way into Germany and spy for us. But had we permitted him to turn what the French expressively term *agent double*, there is no saying that he might not have turned *agent triple*, a proceeding much too complicated in such troublous times. So we merely antedated his certain end in the Tower of London, in a chair which had been occupied by a number of his countrymen.

TO THE MASTER-BUILDER.

MIGHTY Builder, Thou the master
Of creation, nature all,
Build us firmer, hold us faster,
See us not to ruin fall.
Send a ray to wanderers straying,
Blind, we crave a little light;
Lost and doubting, hear us praying
For a dawn on darkest night.

WOODCOCK AND BIRCH WOODS.

By A. R. Horwood, F.L.S.

I.

IT was at one time—a hundred years ago—supposed that the woodcock did not breed in this country. But this fallacy has been entirely exploded. Formerly it may not have bred generally as it does now, but in any case its very shy habits probably caused it to be overlooked in those days. To-day it certainly breeds very frequently in the British Isles. Woodcock, moreover, are to be found in all parts of this country. In England, as breeding birds, they are more general, perhaps, in some of the southern counties, and in the eastern counties, their actual numbers increasing northwards. In Scotland they breed very generally, finding there excellent surroundings. They nest in the Shetlands and the inner islands, but not on the Orkneys or the Outer Hebrides, as there is not enough cover there. In Ireland also they are general, being particularly abundant in the most wooded regions in the west and the south-west, Galway, Clare, Kerry.

Seeing that it breeds now in the British Isles so much more frequently than formerly, or at least that its breeding is more commonly noticed, it is an extraordinary fact that there should be any doubt as to whether the woodcock is a resident and native bird. This may possibly be due to the fact that it disappears after the breeding season, from August to October. It is not likely that it migrates, for birds that have a breeding range that overlaps their winter quarters are residents in the overlapping districts. And it is not a gipsy migrant, having a regular winter domicile here. It disappears at the moulting season, but at such times all birds are very shy, and it is quite feasible that it is simply in hiding, for it is always a skulking bird.

Our resident woodcock are in autumn largely increased in numbers by the flocks that come over in October and November. They choose a clear night, if possible when the moon is full, and when the wind is in the north-east. They travel very rapidly, at probably not less than one hundred and fifty miles an hour, flying at a great height. Sometimes they arrive in a state of exhaustion, and numerous cases are on record where woodcock have been picked up in the streets of towns on the coast. Flight-shooters look out for them on our own coasts, and on those of Scandinavia, Denmark, and Holland, whence they come, after leaving their breeding-grounds in the far north. They are also trapped by the people on both sides of the North Sea. The bright lanterns of the light-ships and lighthouses often lure the birds to their doom, the woodcock dashing against them and being instantly killed. Though they are not gregarious, when a number of birds have collected on the coast awaiting the setting in of better weather, they may leave together in flocks, but as soon as land is reached these flocks break up.

On arrival they remain a day, perhaps, on the coast, and when the weather is open will move inland to the moors. They sit very close at such times, and it is not difficult, with dogs, to put them up. They then make easy shots. If the weather is frosty they seek the woods, which are the last to become frost-bound. When tired at sea coming over, they will alight on the smooth water in the wake of a vessel, and rest a few moments before continuing their journey.

II.

The woodcock's range more or less coincides with that of the snipe, though it is not found so far east as the latter. Both have the same feeding-ground. Woodcock are semi-arctic in range, extending from the Atlantic to the Pacific. They breed as far as 65° N. latitude in west Russia, but no higher than 60° N. in east Russia and Siberia. They breed as far south as the Azores, and in the Canaries, Madeira, the Alps, the Carpathians, the Caucasus, and up to ten thousand feet on the Himalayas, as well as in Mongolia and the mountains of Japan.

They winter in extraordinary numbers in the basin of the Mediterranean, and in Persia, India, Ceylon, Burma, and China. Woodcock are not known to occur at all, however, in Iceland or Greenland. But a few reach North America, where there is also a smaller species, of a buffer colour. Two other species occur in Asia, in the East Indian islands and New Guinea. They disappear from their winter quarters in the Mediterranean region during the latter part of February, and in the Levant in the first half of

 [*All Rights Reserved.*]

March, and passing through this country and north Germany during March, they arrive in Sweden at the end of March or during April. Long before this time our breeding birds have paired; they have nests in advanced seasons in March or early in April.

I do not think there is any bird more particular in its choice of a haunt. What seems to attract woodcock most is a birch wood, the more so—as they must have water near at hand constantly to wash their long bills—if a little rill of clear water runs through it. In other parts the bird is partial to pine or other coniferous woods with little pools and rills. A wood of a mixed character, of oak with some birch and other trees, comes next in point of favour. It is all the more likely to hold cocks if it has a swampy bottom, with a watercourse running through it, lined with alder or willow; and in any case it should have plenty of brushwood or ample cover in which the cock can conceal itself by day. If there are a number of holly-bushes, or other shrubs which keep the ground free from frost and furnish a good litter of leaves, all the better. For when the marshes are frozen, or after dark nights, the woodcock will feed in the woods during the day near its place of concealment, turning over the leaves to find snails and insects. It is always an advantage for a covert to adjoin a swamp. In the absence of this the bird will fly several miles at night to reach one, as this forms its feeding-ground.

It is an extraordinary thing that woodcock will choose one of two coverts apparently equally suitable, and religiously, season after season, avoid the other. They may come yearly to such a covert for many seasons, and then suddenly forsake it for no obvious reason. Such are the vagaries of woodcock ways. They will also unaccountably disappear from their favourite covert, where for weeks they have been known to lie, and for days at a time may not be seen. This is usually due to weather changes, and is connected with their food-supply.

So skulking is the woodcock in its habits that this alone may account for its breeding in a district without the fact being known. It is extremely shy, and consequently very wary. Lying up in the coverts all day, not until dusk does it become active and restless. It remains in its place of concealment by day, moving no more than a few feet away, unless the previous night has been dark and it has not been able to feed to its heart's content, for it is a very voracious feeder, and will consume its own weight (twelve to sixteen ounces) of worms in one night. The woodcock is essentially a solitary bird, and however many cocks there are in a covert, they never associate with one another. Such actions as they appear to perform in concert are merely the promptings of a common instinct made evident at the same time, but obeyed individually. The bird sits very close and is difficult to flush. Its protective resemblance gains for it ample immunity from observation. And it is only by means of its big, lustrous eye that one is able to detect it amongst its surroundings. This eye is placed very far back, as the bird drives its long bill up to the nostrils into the soft mud, and if the eyes were in their normal position it could not do so. Woodcock are essentially nocturnal birds, flying to their feeding-grounds at dusk, and returning at dawn, hiding in the coverts all day. They migrate also by night, as we have seen.

III.

As I have stated, woodcock breed in this country much more frequently than they used to do. There may be several reasons for this, such as the more open winters of the last forty or fifty years, the last serious winter being 1890–91, and before that 1886–87. The more extensive planting of trees may also be reasonably regarded as another cause. Statistics kept at Alnwick show that numbers of birds breed there regularly, and marked birds are shot the same year in November, which in itself shows that they are resident and do not migrate. They breed in the same woods that they use in winter. The nest is placed in undergrowth amongst leaves and dried grasses, and is a hollow in the ground, lined with grass and leaves or moss. It is very well concealed, and the bird on the nest is not easy to locate. The eggs are usually four, sometimes only three, rarely five in number. They are greenish-buff or brown, with darker markings of brown or black, the blotches and spots being mainly at the larger end. They are pear-shaped, and arranged, like the snipe's, in a cruciform manner in the nest. It takes three weeks for the female to incubate her eggs.

At the breeding-season the male loses some of his shyness. He parades before his mate, strutting about with the feathers of the head and neck puffed out like a ruff, his wings drooped, and the tail spread out, and he also indulges in a nuptial flight termed roding, flying backwards and forwards, in a more or less straight course, across a ride or glade in the woods either early in the morning or at twilight, between six and seven o'clock. During this flight he utters two kinds of notes, one of which is a deep, hoarse croak, the other a shrill, sharp whistle, like 'bree, bree,' and 'whe-e-sp.' He flies with his feathers puffed out, and holds his long bill downwards, flitting about with a sort of undulating motion. If two males meet they usually fight, chasing each other.

When the young are hatched they are far advanced, and can soon leave the nest. In order to avoid having to travel backwards and forwards from the marshes to the nest, the mother will carry them down one by one between her legs to the feeding-grounds and back.

Usually she sits close on the nest, and has even been known to allow herself to be handled. But if there are young ones, both birds will try to draw an intruder away by feigning to be wounded, as does the partridge. They display great affection towards their young, which, being protectively coloured (in their down) like the parent birds, are able readily to conceal themselves.

In its ordinary flight the woodcock flies rapidly. It flies straighter than the snipe, giving a twist or two, and then rapidly dropping into cover again, as if shot, in such a manner as often to deceive the sportsman, who thinks the bird is hit.

Usually a silent bird, the woodcock in getting up makes a whirring noise, and sometimes utters an alarm-note like the snipe's, a shrill, rasping note, which is like the word 'skaych.' It also utters a few notes when preparing to leave its feeding-grounds in the early morning.

A nocturnal bird, the woodcock feeds to all intents and purposes at night. As soon as twilight comes it leaves the covert, flying low down a glade, and through an opening, by which it returns at dawn again. This using of a regular opening has caused the poacher to stretch nets across in which to catch cocks, and numbers are caught in this way. When it reaches the open the bird soars to a good height and flies rapidly to its feeding-ground, swooping down suddenly, nearly vertically. There it remains all night, feeding on worms, insect larvæ, and small shellfish, with some proportion of vegetable food.

Its bill is very long and slender, and lined with a number of large nerves, which give it a special sense of contact, so that when its bill is plunged in the soft mud it can readily sense a worm at the end of it. One bill overhangs the other, and the tip is delicately sensitive. As soon as dawn appears, woodcock wheel round and round and rise gradually to a good height, and fly rapidly back to covert by the opening by which they left it. Sometimes poachers throw up mounds across their feeding-grounds, leaving a gap here and there in which they set nooses or springs, and catch many in this way. They do the same in low hedges.

Woodcock-shooting is an excellent sport. I do not think they are as difficult to shoot as snipe. True, when they twist in and out amongst the trees in a covert they afford tricky shots; but on the whole they fly straighter than snipe, and not quite so fast. They are often sluggish in misty weather, and after a clear night and a heavy feed. As a rule they are shot in the ordinary course of covert-shooting, and form part of a mixed bag; but they may be walked up in line with dogs, or may be driven over guns. Placing guns in the last instance is a matter of local knowledge. They are fond of dashing down a glade or an open ride, and have their own openings for leaving a wood. These should be known. Woodcock are also to be obtained in the early morning and at twilight by flight-shooting. When waiting for them to come over between covert and marsh, it is well to lay a piece of white paper a little beyond one to attract notice, for then it is that a shot may be best put in.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER I.—*continued.*

IV.

DISTINCTLY Clement was looking forward to his voyage on the *Empress of Prague*. He left the office tingling with pleasant anticipation.

And yet he had not found out the girl's name. Beyond the fact that her companion called her Loise, he knew nothing about her. He might have inquired from the shipping-clerk. He did not inquire. He was as young and as straight-minded as that.

He had thought about her a great deal between that time and the sailing of the boat. And because he thought in this fashion he was early at Paddington on the day that the boat-train left. He had got all his own luggage into the van with the celerity of an old traveller, and was looking out for her some time before she arrived.

He helped her and her companion, the Gorgon. He had already found them a compartment, and had secured it with a healthy tip. It was to be his own compartment, too, if she gave permission, and, delightfully, she did. He travelled with her all the way to Liverpool, but on looking back at it now, it had been rather a curious journey.

He had put certain things down to accidents—those accidents that will beset travellers at times. But now—he wondered.

In the first place, he had nearly missed the train. They had been sitting there, chatting, quite serenely, gazing with slightly amused contempt at those passengers of the breed always doomed to be late for trains. Then the Gorgon discovered that a rather special parcel left in the baggage-room yesterday (Heaven knows why!—the Gorgon seemed the sort of feminine mystery who would do just that sort of thing) had not been retrieved. When the Gorgon mentioned the parcel the girl Loise had made an exclamation of acute vexation.

Clement was young enough (and she was pretty enough) for him to seize such an oppor-

tunity of doing her service. He said decisively it might be rescued, and he asked crisply, 'How much time have we?'

It was the Gorgon who had pulled out her watch with (now he could see) astonishing celerity. The watch showed that there was a full thirteen minutes to spare before the train went. That was ample. The Gorgon gave him the cloakroom ticket for the parcel. The girl described its nature rather well in one or two words. She had been present when the Gorgon had handed it in, and indicated the shelf on which it had been placed.

Clement darted out to the cloakroom, not looking at the station clock, as he should have done. He reached the counter, put the ticket and a large tip on the zinc surface, and exhorted the attendant to hurry. The attendant smiled happily at the tip, examined the ticket, and said blandly that it was 'na-poo.' It wasn't his ticket at all; it was one issued by another station —Victoria.

'Hang!' shouted Clement; 'I must get that parcel. There it is over there.' The girl Loise's description and directions had helped him out. He told the attendant in vivid language who had left it. He was not kind to the Gorgon, but his picture of her was unmistakable.

'I remember,' said the attendant. 'Remember the lady wot was wit' 'er. A very pretty lady. All the same, you ain't got the right ticket.'

'Hang it all, man, don't argue!' shouted Clement. 'I've got to catch the boat-train.'

And when he said that the attendant had suddenly become very much alive. He snatched at the parcel and swung it over. ''Ave you got to catch it? Well, you've got to run blame 'ard ter do it. It's just about going out.'

As Clement, sprinting like the deuce, ran for the train he glanced at the station clock. Heavens! that wretched woman's watch must be frightfully and femininely wrong. The train was just due to leave.

He simply hustled himself by the ticket-collector at the platform gate. The man shouted at him, but Clement fought his way by—if they wanted to question him, they must do it at the other end. And he had no time to spare. The train was just moving.

He flung himself at the door of the guard's van. And the evil chance of such things seemed to be against him. A very large, a very bulky, man was trying to do the same thing. He was an idiot of a man. He stumbled and fumbled. He blocked the way with his hideous ineptitude. So stupid was he that Clement had the feeling that exasperated people do get; that is, the fool was doing it all purposely.

Clement Seadon was young and very active. While the excessive man still stumbled and blundered along beside a train steadily gathering pace, Clement nipped ahead of him, and with an agile twist was on to the footboard and into the van.

He turned at once to help the large fool, to find that he was too late. With a surprising access of nimbleness the big fellow was already in the train, standing beside him in the van; already saying with a sort of purring urbanity, 'Well, that was the nearest shave—nearer for you, sir. Really, I must apologise. I did not actually realise you were trying to get on the train. I thought you were a porter or some one trying to help me. I must apologise, sir.'

He said this with the utmost geniality, which, at the same time, seemed to be reserved. It was as though he spoke automatically the right things to say, but what he said had no relationship to what he felt. And while he spoke he stared fixedly across Clement's shoulder, and Clement was aware of the smallness of his eyes and their astonishing closeness together.

Still, everything had ended well, and Clement said so. He parted with this far too much of a man, and made his way along the corridor to his compartment. Here he was not at all sorry for the accident. Both ladies were in a lively state of alarm, and that alarm gave way to a cheery thankfulness at seeing him safely on board once more.

Or, rather, with the girl Loise that was how things worked out, and, so far as she was concerned, the journey was made even more attractive by the emotion this little episode had called up. It was not quite the same so far as the Gorgon was concerned. She seemed overwhelmed by the knowledge that it was her stupidity in the matter of her watch and the wrong cloakroom-ticket that had nearly caused Clement to miss the train and the boat. Her apologies were profuse, and she endeavoured to make an amende by correcting, rather late in the day, the time on her watch. And after that she sat silent during the journey, as though brooding over her folly. Clement did not mind that at all; he was far too much taken up with the vivid girl.

The rest of the journey was uneventful—unless (and Clement was now seeing things in a more acute light) one could see something grave in the tiny incident on the landing-stage. The incident really was trivial. It was the sort of thing that was so often happening to travellers.

The whole of Clement's baggage had gone astray.

Now that he looked at it, Clement began to see the strangeness of the happening. The fact that he had not been at all careless made it singular. Being a traveller of experience, he had not left his baggage to chance. There was a fair amount of it, for he carried guns and rods and golf-sticks and the rest of his sporting and living kit with him. He had seen every article out of the van, and checked off the lot. He had

found a very useful porter, and had given quite definite instructions.

He had done this quickly and swiftly in the manner of a tried traveller; then he had slid across the platform of the freight-shed to the ladies, for whom he had already found a porter, to offer any further help that was necessary.

He helped them, as a matter of fact, with their small parcels towards the gangway of the ship, when those parcels were taken over by the stewards. He had looked round as they all left the shed, and noted that his porter seemed to be successfully grappling with his own pile of impedimenta. He happened to notice, also, that the big man who had nearly prevented his catching the train was near his porter, and was apparently again exhibiting his complete inefficiency over his personal luggage.

Pleased with himself, Clement had boarded the *Empress*, and made his way to his cabin, encountering on his way the steward, an old friend of his. 'How do you do, Nicholson?' he had said. 'You see I'm back again. . . . And, I say, my traps are just being brought on; you might look to them, there's a good scout. The two suit-cases in the cabin as usual, and the heavy stuff to the baggage-room.'

Nicholson, who knew both his name and his manner of tipping very well, went off at once. He returned in twenty minutes, to give the surprising news that there was no sign of Mr Seadon's baggage on the purser's deck, where the incoming baggage was generally dumped, in the baggage-room, on the quay, or, in fact, anywhere.

Clement was both astonished and angry. Never since his green days as a traveller had he had as much as a single piece of baggage go astray. In fact, the happening was a shock to him, since he rather prided himself on his capability. But he did not waste any time in arguing. Nicholson, he knew, was not a man to make mistakes or to do things by halves. If he said the baggage was missing, it was missing. No time must be lost in finding it. For naturally it must be found, or he would have to postpone sailing. He could not undertake a journey without a spare stitch of clothes; he could not go on a sporting-trip with every item of his sporting-tackle left behind.

The stuff that was in Clement Seadon came out in the way he handled this contretemps. He wasted not a moment in vain search. He went straight to the Canadian Pacific shipping-agent, and put the problem up to him. The man belonged to a service that suffers attractively from an ideal of complete efficiency. Directly Clement had spoken of his disaster the agent began to hustle.

He was, of course, helped by Clement. Clement had the type of mind that pays attention to a porter's registration number when the porter holds up the metal plate upon which it is stamped to the hirer's gaze. Clement remembered and repeated the number, and left the matter in the hands of the agent. In half-an-hour his luggage was on board the *Empress*.

What had happened he never quite knew. A foreman had named the porter from the number, a dock policeman had stated that he had seen this man trundling the barrow-load of luggage away from the shed in the direction of the Cunard dock, and the luggage was run to earth there. The porter, on being taxed with his strange behaviour, offered a wild and absurd story of having been told that Mr Seadon had suddenly received orders to go by Cunard. A steward had come off the *Empress* just as he was going on to it, and given this very definite command.

He was, so the porter said, 'a littlish, mean-looking 'ound of a steward.' Nicholson was a big man. And, though the porter may have based his description of the offending steward on anger, Clement, with a sudden blaze of comprehension, now recognised how well that description fitted the steward who had just tried to turn the little lawyer off the boat. Had that steward tried to keep *him* off the boat also? It looked extraordinarily like it.

Thus, though he might have been inclined to scout, as something absurd and unreal, the whole idea of the gang of rogues who were working to accomplish the undoing of the girl Heloise and her (as the lawyer said) million pounds, actually the train of circumstances forced him to say limply to his uninvited visitor, 'You are rather stunning as well as other things.'

(*Continued on page 35.*)

POWDER-PLAY.

By Lieutenant-Colonel C. P. HAWKES.

The most exalted seat in the world is the saddle of a swift horse.—MUTANABBI.

EACH country and each race has its national sport, or sports, loved and practised equally by high and low; by the aristocracy, whether of blood or of wealth—in all countries the latter now predominates—and by the mass of the people.

The British have cricket, golf, and the two kinds of football; though Association, save in the services, the hospitals, and the universities, is now far too much spectacular and a matter of stage-management and the price of 'players,' hirelings like the gladiators in ancient Rome. (A flat-rate for half-backs is, I understand, a burning question at the present time among

these 'sportsmen.') Horse-racing, too, has become too largely a vehicle for gambling, a provider of dividends for course-owning companies and vast incomes for bookmakers. The French have no national game, *Jeu-de-Paume* and *Pelota* being confined chiefly to the Basques on both sides of the Pyrenees. Spain has her bull-fights, like Cnossos of old, and 'God's own country' baseball. To the Moor the national sport is the powder-play, and in this all who can, rich and poor, high and low, indulge on horseback or afoot on every occasion that offers: on holy days, at State ceremonial festivities, at weddings, and at all times when public rejoicing or festival is demanded. In the best powder-play the players are mounted, for the Arab and his horse are one. There is no contest save in management of horse and gun; no sides, no struggle between teams. The game dates from the remote antiquity of the race, and symbolises its history through the ages; splendid and gallant in performance, magnificent in its appeal to the eye and the senses, and futile in its essence. The intoxicating charge of the warriors in their finely coloured flowing draperies, the blaze and rattle of the firing, the thunder of the hoofs, and the sudden stop of the seemingly irresistible onrush, with the relapse into a slow, inevitable retrogression, present the picture history has drawn of the racial achievement of the Arabs.

Hilaire Belloc, who knows the *Maghreb*, sums it up somewhere in a sentence, telling how North Africa was 'swept into the Arab language and religion in one cavalry charge.' The flood of the Arab peoples, high with the fanaticism of Islam, surging to east and west, promising at its full a high intellectual predominance, checked and stemmed eventually at Tours, has been slowly receding through the progression of the centuries to an unchanging stagnation uninfluenced by temporary troublings of its waters.

It was my lot to witness once a powder-play —which the Moors call *La'ab-el-bârûd*—outside a city in northern Morocco, in which men say there live the descendants of the great Moorish families of Granada, with the keys and title-deeds of their former homes in the *Vega* of the *Genil* still in their possession. In passing, I may say that this has always seemed to me incompatible with the claims of the old families now in Granada to possess similar records of their Moorish predecessors. But Allah is the judge!

The occasion and the scene rise vividly to my recollection. It is the feast of *Meilûd*, the birthday of the Prophet. The setting is formed by the old walls of the town, with minarets beyond—walls built of the rammed mud of the colour of Devon earth, which gives its name to the Kasbah Al'hamra in Granada, and pierced by a fine gateway of that horse-shoe shape which seems modelled on the silhouette of a man clad in a hooded *jellâb* and facing windward. The gateway is made with a double turn, presumably to check the rush of a storming-party, while round the arch runs a scalloped pattern like the teeth of an open mouth waiting to close upon and scrunch the succulent intruder. In front is a vast open space, with a gentle slope from the foot of the walls, now dry and dusty, but muddy in the rains as Picardy or Flanders, on which are held markets, and which serve on festivals as an arena; fringed on each side by groves of trees which give a gracious shade from the African sun. All round is a vast concourse of Moors—townsmen, tribesmen, and country-people—vociferous, many-coloured, and of unceasing movement, fit subject for an Arthur Melville or a Brangwyn. Fully half are mounted; horses, mules, and asses of every quality and description abound. Some of the donkeys carry two or three, riding *mardûf*—a father and his sons, an elder brother and his juniors. The horses are wiry, but for the most part of poor quality, slack-loined, and with toast-rack ribs and ewe-necks. Most of the men wear the white *k'sa* or the brown *jellâb* and snowy turbans or the *shashia*, the Moroccan fez, though many of the countrymen are content with a twist of cord or camel's-hair, or for turban wear the scarlet felt covers of their guns twisted around their heads. Here and there rides a *Maghzeni* or Government official, or a 'warm man' of merchandise, with robes of a surpassing whiteness, rich cloth *selham* or burnous, and brilliant lemon-coloured slippers. In and out shamble shabby *askâris* or soldiers in fez and red jacket; while everywhere are Jews, male and female, in dark gabardines and greasy side-locks—each one a Shylock or a Jessica, 'the very Jew that Shakespeare drew'—their faces animated now, but stamped for ever with the racial imprint left by centuries of persecution. These have come from squalid homes—no index to their owner's true wealth—in the Mellah, or 'place of salt'—the Moorish Ghetto—which they inhabit with the right, granted to them for ages by each sultan, of pickling the heads of rebels or his enemies in salt before they are affixed over the city gates, like withered apples in the sun, or like the demon heads which are the fruit of the tree *Yacoun* in hell. One thinks of the gates of medieval London Bridge whereon there ripened a like ghastly crop. On the fringe of the crowd a lunatic (with tangled hair and chiefly clothed with dirt) indulges in Caliban-like gambols, unheeded and unmolested by the crowd, who, as their faith enjoins, regard him as one favoured of Allah, as the Irish peasantry do the village natural. Water-sellers with their skins, like the *Bhistis* of India, thread their dripping way through the press with hoarse invitations to a draught, '*Lâkhass-Hu'L-Mâ! Lâkhass-Hu'L-Mâ!*' ('For him who wants water! For him who wants water!'). Most of the crowd show traces of ophthalmia, smallpox,

or syphilis; for Morocco, like most Mohammedan countries, is steeped in vice, and the people are riddled with disease. The noise, the light, the colour, and the all-pervading, indescribable smell of the Orient intoxicate the senses. From somewhere comes the insistent throbbing of a drum, inevitable accompaniment of an African festival, the pulsating sound of which heightens excitement to the verge of frenzy, and indicates the direct origin of the orgiastic African syncopation to which the wives and daughters of the conquering Anglo-Saxon race dance with their men-partners, retained by arrangement, in the aristocratic dance-clubs of London and New York. Occasionally in a lull one catches the penetrating note of a *ghaïta* (the Moorish flute) with its indefinable melancholy appeal, now shrill, now wistful, like the twittering of a bird or the liquid bubbling of an unseen fountain. All is punctuated by occasional shots, which seem to fan the din as bellows urge a flame.

And now at one end of the cleared space round which the crowd is gathered appear a dozen riders on good horses, forming a rough line. The horses, stallions, mostly white or gray—though there is one roan—are of the true Arab type, the *'Abda* breed, fit descendants of the five mares of the Prophet; small and well-shaped heads, with black muzzles, good legs, and bodies well ribbed-up, though poor in the quarters (the result of being ridden too young in the powder-play, with its overstrain on the quarters in the sharp pull-up at the end of a run)—a defect noticeable in most good horses in Morocco. Their normal pace is a quick ambling walk which eats the miles. Whinnying fighters are these stallions, and I have seen in the Sôk at Tangier two upreared and fighting with their teeth and forelegs like Marseilles seamen outside a café on the Cannebière. The saddles are high-backed and pommelled, and of a red cloth—they seem too heavy for the stamp of horse—and have large, sharp-cornered shovel-stirrups of inlaid metal, and broad girths and breeching, both quite loose. The bridles are heavy, and the bits cruel, with severe curbs. The riders, *kaïds* from the country or men of position in the town, are mostly young or men of early middle-age, with faces no darker than one sees in Seville or in Naples, and beards of varying thickness, with a small line of moustache above. One is fairer than the rest, and seems to be the leader, his face like a Vandyke, with pointed beard and disillusioned eyes, resembling that of one well known in Maghreb-al-Aksa—Cunninghame-Graham, Gaucho of the Pampas, ex-legislator, man of letters, aristocrat, and fiery Socialist, who once, as 'Sheikh Mohammed-al-Fasi,' journeyed alone to Tarudant, in southern Sus. Another shows traces of black blood in his flat nose and thick protuberant lips. The horsemen's faces have for the moment lost their impassivity and are lighted with the excited expectancy of those about to play a part they love. Clad in spotless turbans, fine *k'sas*, and flowing *selhams*, each man grasps a rifle or a long flint-lock gun, like the *jezail* of the Pathan, with curved and ornamented stock. In order to take part in the powder-play a Moor will borrow or steal or part with his few remaining coins to hire a musket with which to make the powder speak. The signal given, the line of horse breaks at once into a headlong gallop; the sharp spike-spurs or the corners of the shovel-stirrups strike again and again into the horses' flanks. The noise of the crowd is hushed. Clouds of dust ascend. The riders scream and shout as they gallop, firing wild shots in front, to rear, and sides. Two whirl their weapons overhead, as their forebears did their long desert lances, and then, swinging them underneath their horses, catch them again on the other side. Others stand on their saddle and fire into the air, then drop back into the saddle, leaning forward over the stallion's ears and firing at the ground in front, or lie back in the saddle till their turbans touch their horse's rump, or hang on at the side and fire round the horse's shoulder. The reins are loose or held in the teeth. The horse is guided by knee and heel alone or gallops unguided where the others lead.

But for the difference of weapons one might imagine them to be the cavaliers of S'ąlla-ed-din pricking to combat with crusading knights on the plain of Ascalon, or the Emirs of the Cordovan Caliph thundering to do battle with Roland and the Paladins of Charles.

Up the gentle slope rushes the cloud of dust with its sharp glints of flame, its swaying, leaping figures in fluttering dashes of colour and heliographic gleams of metal, its maddened, straining, foaming horses. Suddenly, at the wall, it comes to a dead stop, as at the edge of some yawning abyss, the cruel bits throwing the stallions right back on their haunches, forelegs taut as steel rods. So must Sidi Okbar ibn-Nafi at the head of his desert squadron have pulled up his horse on the verge of the Atlantic after crossing the plains of the Sharf El 'Akab in his whirlwind conquest, and raising his spear to heaven, have shouted his cry, enshrined for ever in the stately prose of Gibbon: 'Allah! If my course were not stopped by this sea I would still go on to the unknown kingdoms of the West, preaching the unity of thy Holy name, and putting to the sword the rebellious nations who worship other gods but Thee!' Turning quickly, the whole cavalcade then return at a quiet walk to the place whence they came; the horses blown, and dripping blood from mouth and flank; the riders swaying gracefully in their high-peaked saddles with short stirrups, the excitement gone from their faces, which have resumed their normal air of dignity and gravity—their eyes fixed on the distance with an expression of fatalistic pathos surely such as was worn by

Bu Abd 'Allah, last Emir of El Andalus, as he turned (at the place still called by the Spaniards 'The last sigh of the Moor') for a sad, final look at the glories of his lost kingdom. This is well done, for it is considered a great point in the powder-play that the quietness of the return should be as great a contrast as possible, both in horse and in rider, to the fury of the onrush. The crash of noise from the crowd breaks out anew at the conclusion of the course, and another line of horsemen forms up at the far end of the ground to repeat the feats of the first. And so successive lines go through the morning, and continue again in the later afternoon. Presently one notices a change in the character of the players. The riders appear to be men of lower station, less richly dressed, with guns that fail to fire, and horses poor in quality and speed. And so it is, for all conditions of men take part in this national sport. The poorer horses suffer more, and ill-fitting bits and ill-used spurs produce more blood; though as a rule, whatever his class, a Moorish horseman is possessed of 'hands.' Some of the poorer folk who can find no horses burn powder on foot, tramping in a circle, with loud cries, and discharging their untrustworthy pieces. At last the crowd begins to thin, the enthusiasm to wane. Horsemen ride off within the city gate or quietly disappear into the landscape for country *kasbahs* and far villages. The families of Jews crowd Mellah-wards. The lunatic, the devils faint within him, walks like his prototype through dry places seeking rest. It takes some hours for all to disappear, and shots go on and dust still mounts into the dust-laden air. The sun declines; the quick-falling southern darkness descends. White minarets and walls take on a silvery tone in the half-light, and the sadness of the Eastern night enfolds the anachronism of it all, only to be broken by the long-drawn cry of the muezzin chanting from the tower the call to prayer, unsurpassed for beauty, full of the pathos of the Arab race, more poignant and arresting than any chime or stroke of bell, and bringing to the minds of all true believers the confession of faith in the unity of God enjoined upon them by the one-time shepherd-boy of Mecca some thirteen centuries ago.

PEGGY UTTOXETER'S ENGAGEMENT.

By C. L. M. Brown, Author of *The Fall Triumphant, Semi-Detached,* &c.

I.

'OH, my dear,' exclaimed Mrs Uttoxeter with rapture, 'I am *so* pleased!' She imprinted an ecstatic kiss upon her daughter's unresisting cheek, and regarded her with maternal pride. 'A bank manager—and such an estimable young man! You'll be the happiest girl in the world.'

Peggy Uttoxeter sat motionless, without replying. Her eyes failed to reflect her mother's triumphant exuberance. She seemed frightened.

'What's the matter, Peggy?' asked Mrs Uttoxeter. 'You look worried about something, dear. I'm sure you should be in the best of spirits to-night. Fancy Mr Armitage proposing! Of course, I had hoped. I won't say I hadn't *hoped*—we mothers have our little secrets, you know—but I never dared expect it would be so soon. Such a sensible young man, too; so different from most of the young men nowadays. And a bank manager, dear! It seems almost too good to be true.'

Peggy's lip quivered; then, without further warning, she burst suddenly into tears. 'I—I don't love him!' she sobbed piteously.

Mrs Uttoxeter lifted her hands in blank amazement. 'What!' she cried incredulously; 'don't—don't love a bank manager? What are you saying, Peggy?' Then her face softened. 'Poor child, you're overcome!' she exclaimed sympathetically. 'The excitement's been too much for you. Hush! hush! Come and cuddle up to mummy, then.'

But Peggy avoided the proffered embrace. 'I don't love him a bit!' she sniffed desperately.

Mrs Uttoxeter stared helplessly. 'I'm sure I don't know what you mean,' she said. 'I don't see how any girl could help loving Mr Armitage.'

'His moustache!' muttered Peggy incoherently.

'Why, Mr Armitage has a most handsome black moustache!' exclaimed her mother. 'Your dear papa had nothing like so fine a moustache when he proposed to me, and I'm sure I never repented accepting him. Quite an ordinary little yellow moustache it was. Come, Peggy, this is foolishness, you know, dear.'

'It—it scraped when he kissed me,' sobbed Peggy miserably. 'Oh, mother, I'm sure I shall never be able to love him one tiny bit—I simply *couldn't.*'

'Rubbish!' said Mrs Uttoxeter complacently. 'You're tired out, dear, and nervous. You must come along to bed, and I'll bring a little something up to your room. You'll feel a different girl altogether in the morning;' and placing a stout, capable arm round her daughter's slim shoulders, she led the still weeping Peggy resolutely from the room.

'A bank manager, my dear!' she murmured soothingly as they mounted the stairs together.

II.

A proposal is an extremely nerve-shattering experience. It goes to the heart of things, so to speak. Even to the most eagerly-sought-after damsel, to whom ardent suitors are no stranger than butterflies in a summer garden, a proposal can never be a thing of complete indifference. However glacial and calculating she may be, there is that in a proposal which brings a pleasing tingle of excitement, a certain swift throbbing of the pulse, a glimpse, as it were, into the infinite of life. Imagine the effect, therefore, upon a girl not yet out of her teens, to whom these vital matters of the heart have hitherto lain wreathed in a pleasing mist of romantic unreality. Can it be a cause for wonder if she flounder helplessly, like an inexperienced swimmer plunged without warning into sudden deep waters? It cannot. Any one would flounder.

To Peggy Uttoxeter the thing had come with the sudden, bewildering shock of a cosmic upheaval. She had lost her head. When George Armitage had unexpectedly pressed his suit in a quiet country lane (if the somewhat ambiguous phrase may be pardoned), she was overwhelmed. The thought of marrying Armitage had never entered her mind, even as the remotest of fanciful possibilities. Dazed and bewildered, she had murmured a meaningless 'Yes,' and before she fully realised what had occurred she felt his moustache upon her lips. It was like a horrible nightmare—a nightmare that refused to vanish with the dawn, that might never vanish at all; and her mother was jubilant about it.

At the breakfast-table next morning Mrs Uttoxeter exhibited a benign, though subdued, satisfaction. Studiously avoiding reference to Peggy's hysterical assertions of the night before, she devoured fried egg after fried egg with that zest of appetite which is the outward manifestation of an untroubled soul. She was pleased with Peggy; she felt the girl had justified her upbringing. In spite of one or two schoolgirlish outbreaks which had hinted at a hidden spirit of daring and adventure nascent beneath Peggy's quietly demure exterior, she had always been a good girl, and Mrs Uttoxeter had never doubted that she would make a prudent marriage. And now she was to marry George Armitage. How splendid! What an eminently satisfactory and comforting arrangement!

'Do have this other egg, dear,' said Mrs Uttoxeter persuasively. 'No? Well, I won't let it go out. What a beautiful morning it is!'

Peggy had no appetite. Through the leaden gloom of despair that had descended upon her spirit one single thin ray of hope still glimmered, and she reached out towards it as drowning men are reputed to clutch at straws. She must go and see Freddy. Freddy had always helped her out of scrapes in the past; might he not be able to come to her rescue in this last overwhelming catastrophe? She had a great and unbounded confidence in Freddy; if any one might achieve the impossible, it was he.

As soon as her mother had completed the discomfiture of the remaining egg, Peggy slipped away, and hurried in the direction of a house standing back from the road some hundred yards nearer the town. As she entered the gate a perturbed voice hailed her from the top of a large elm standing by the entrance.

'I say, Peg,' it wailed, 'I've got my beastly kite stuck in this tree. Give me a hand to get the bally thing down, there's a sport!'

The form of a small boy was partly visible through the leaves, perched on the edge of destruction, and gazing hopefully down upon Peggy.

'Really, Jimmy,' she said, 'I can't possibly climb up there to-day. You'll break your neck, anyway. Where's Fred?'

'In the hammock,' answered Jimmy. 'He won't come—I've asked him. Says he's reading, the rotter! I've torn my beastly bags, too!'

Without replying, Peggy followed the path round behind the house, and opened a small gate leading into the garden beyond. A hammock was slung between two trees, and over one side of it a leg, garbed in a gray flannel trouser and terminating in a stockinged foot, drooped negligently earthwards. Immediately beneath it lay a leather slipper.

Peggy started impulsively towards the depending limb. 'Oh, Freddy,' she cried, 'something awful's happened.'

The hammock wriggled uneasily, and a hand shot upwards in a convulsive clutch.

'Hullo, Peg!' said a voice from the hidden depths; 'what's the trouble?'

'Freddy, I—I'm engaged.'

The hammock gave a violent leap, like a somnolent monster stung suddenly by a gadfly, and the head and shoulders of a young man shot into view.

'What?' he exclaimed in a voice of utter astonishment '*What?*'

'I'm engaged,' repeated Peggy weakly—'to Mr Armitage. I want you to help me, Freddy'

Freddy struggled to a sitting posture and regarded her with a sort of dazed stupefaction. 'Armitage!' he repeated blankly; 'that—that—— *Good Lord!*'

'Yes,' said Peggy. 'He proposed last night, and I—I said, "Yes." Isn't it horrible?'

Freddy continued to stare in silence; then gradually his expression changed and his lips set grimly. 'Well, I'm sure you have my hearty congratulations,' he said coldly. 'I hope you will be very happy. I had no idea'——

'Don't!' cried Peggy. 'Don't talk like that! I want you to help me, Freddy—like you did

when I lost my shoe in old Colonel Baxter's strawberry-bed. Don't be horrid, please.'

Freddy descended and donned his discarded slipper. 'Do you mean to say that you don't want to marry this fellow?' he remarked slowly.

'Of course I don't! How could I?' cried Peggy desperately.

'Then what the dickens did you accept him for?' he demanded.

'I don't know,' groaned Peggy dismally. 'I was so flurried and upset, I didn't know what I was saying.'

'Then why not go and tell him you've made a mistake, and you don't think there'll be anything doing, after all?' suggested Frederic practically. 'It's quite simple.'

'Oh, I couldn't!' exclaimed Peggy. 'It wouldn't be nice. I should never be able to look any one in the face again. Besides, there's mother.'

'Well, that seems to finish it,' said Freddy. 'If you're such a silly ass as to tell a fellow you're going to marry him when you don't want to, you'll have to see it through, that's all.'

'But I didn't mean it,' wailed Peggy. 'I was so frightened. No one had ever asked me before, and'——

She made the remark in perfect innocence, but Freddy went scarlet to the temples. 'Well,' he said savagely, 'I should hang on to him tight, now you've got him, in case no one ever asks you again. I don't see what you come crying to me about, anyway.' He swung round and tugged viciously at the hammock-lashings.

'Oh, you beast, Freddy!' cried Peggy furiously. 'You nasty, mean beast! I'll never speak to you again as long as I live;' and turning on her heel, she ran back down the path and out into the road.

III.

Frederic Knowles climbed slowly back into his hammock and lay gazing up towards the green leaves above him, striving to pacify the varied and not pleasant emotions the recent conversation had stirred up. Peggy Uttoxeter engaged to George Armitage! The thing was impossible. But there it was.

He and Peggy had been friends from childhood; always he had vaguely realised that they would one day marry each other, as it were in the natural order of things, but he had never brought himself face to face with the question as a matter requiring immediate action on his part. It had never occurred to him before that they were now no longer a boy and a girl, but two grown-up persons to whom such considerations as engagements and marriages were no longer mere phrases, but urgent facts of life, pregnant with vital possibilities. Good heavens!

His first feeling was that Peggy had behaved shabbily towards him; but his natural fair-mindedness quickly banished the thought. After all, she was only a kid, really, and had been rushed into a predicament which she had done nothing to bring about. Besides, as she said, no one had ever asked her before. And in a fit of absurd pique he had been unforgivably rude to her. It was certainly up to him to get her out of this mess somehow; she had come to him for help. Besides—besides—he must do it for his own sake. He couldn't let her go. His feelings for Peggy were no longer gently complacent; they were eager, imperative, calling on him to act and redeem his past neglect.

'I'll go and see her this afternoon,' he decided, 'and apologise. Surely something can be done before it's too late.'

'I say, Fred,' said a plaintive voice, 'you might come and get my kite down, there's a sport! You're not reading.'

'Clear out, you little brat,' snapped Frederic angrily, 'or I'll come and punch your confounded head for you. Hop it!'

'All right; don't get your rag out,' said Jimmy, retreating sulkily. 'Pig!' he added defiantly from the farther side of the gate.

IV.

Frederic rang the bell and inquired whether Mrs Uttoxeter was at home. He was perfectly well aware that at this hour Peggy's mother was wont to enjoy a restful, wrinkle-banishing siesta, and that his mission would not be interrupted by her genial society.

'I'd like to see Miss Uttoxeter, then,' he told the maid.

He found Peggy in the drawing-room, tinkling the piano without enthusiasm. She stopped as he entered, but did not greet him.

'I've come to apologise for being such a brute this morning,' he said. 'I know you'll be a good sort, Peggy, and forgive me. I want to clear up this Armitage tangle, if we can.'

Peggy brightened a little. 'Whatever made you so horrid?' she asked, relenting rapidly before the glow of Freddy's obvious repentance.

'I don't know—something must have disagreed with me, I think. Don't let's talk about that, anyhow. What are we going to do about Armitage?'

'Do you really think we can do something?' exclaimed Peggy eagerly. 'Oh, how splendid! I knew you'd help me somehow, Freddy.'

'It's a case of "must," not of "can,"' declared Freddy earnestly. 'It's far too serious a matter to go on any longer.'

'It is,' agreed Peggy in sepulchral tones.

'Sure you can't just write and tell him it's all off?'

'Oh no,' cried Peggy. 'Oh, I daren't. It must be some other way.'

'Then we must make him break it off,' said Freddy decisively.

'But I don't think we can,' objected Peggy gloomily. 'He—he loves me, Freddy; he told me he did.'

Frederic snorted. 'You must show him he 's made a mistake,' he declared. 'What about cooking something and sending it to him?—one of those Madeiras of yours; that ought to put him right off.'

'Now you 're being horrid again,' said Peggy plaintively. 'You don't realise how serious this is.'

'I do,' he answered. 'I do indeed. The question is, what are you game for?'

'Anything,' cried Peggy impulsively. 'I 'm game for anything, Freddy, if it will save me. You know I 'm not a funk.'

Freddy pondered in silence. 'Then, in that case,' he said at length, 'I dare say the matter may be contrived. Let us proceed to weave the web.'

'Oh, do tell me, Freddy!' cried Peggy excitedly.

V.

George Armitage was a man whom nature had framed in a cautious mould; he looked before he leapt. Although he had studied with care the maxim of Solomon asserting that 'whoso findeth a wife findeth a good thing,' and though fully realising that Solomon spoke with the full weight of experience behind him, he was also acutely conscious that, in these unquiet times, whoso findeth the wrong sort of wife findeth anything but a good thing—quite the reverse, in fact. Manners have changed since the golden days of King Solomon.

There was but little romance in George Armitage's disposition. He did not go to his wooing blithely at the call of spring, with a rose in his bonnet and a carol on his lips. He held very strongly that such a course was extremely liable to land a man into trouble of the worst kind. He was a discreetly judicious rather than a rash lover. What he desired was an amiable little body who would regard him with reverence and awe, a domestic acquisition not likely to overstep the bounds of a proper wifely devotion. After careful deliberation, and even then not without misgivings, the finger of choice alighted upon Peggy Uttoxeter, and she had been too startled to protest.

Peggy was not one of those wild creatures who voted, danced impossible and disgraceful dances, and shouted vociferously of their rights as women in the ear of terror-stricken man. George Armitage decided that he would be able to manage Peggy nicely. He was feeling rather braced with life.

Peggy had been spending the afternoon at a friend's house some distance from the town, and he had arranged to meet her on the way home when released from his duties at the bank. He strode along the quiet lane with an almost sprightly step, gaily twirling the flowing extremities of his copious black moustache, of which he was not unreasonably proud, and contemplating the agreeable vista of the future with placid content.

Turning a corner, he saw Peggy in the distance, and waved her a playful greeting with his walking-stick. She replied almost boisterously, and hastened to meet him. As she approached, Armitage was dismayed to observe that she was smoking a cigarette.

'Hullo, old bean!' she called out as she came up. 'You 're frightfully late, aren't you? I began to think you weren't coming. You really must try to be more punctual, you know.'

Armitage regarded her in pained astonishment. 'I beg your pardon,' he said with dignity. 'I came as soon as my responsibilities at the bank permitted me.'

'Oh, well, I 'll be lenient this time,' said Peggy. 'Don't let it happen again. How are things going, anyway?'

Armitage passed his hand over his brow. This was most unsatisfactory; he would never have believed it possible. He must lose no time in exerting a little authority.

'Very well, I think, thank you,' he replied stiffly. 'By the way,' he continued, 'I did not know you were addicted to the unseemly and—er—unpleasant habit of smoking. I hope this is only a chance indulgence.'

Peggy laughed with gentle amusement. 'Good gracious!' she exclaimed; 'what a quaint thing to say! You sounded quite antediluvian. You 'll be asking me to sign the pledge next!'

George Armitage tugged wildly at his moustache. Could this really be the same little Peggy Uttoxeter who only a few days earlier had demurely promised to be his wife?

'I do not at all approve of the attitude of the modern woman,' he began in a brave attempt at self-assertion. 'This tendency to independence, this aping of the meaner masculine vices'——

A peal of laughter from Peggy cut him short in confusion.

'I say, you really are priceless!' she observed. 'I must take you to one of our Woman's Progress meetings—you 'll be better than George Robey. Where *have* you been living all this time?'

'Woman's Progress meetings!' stammered Armitage blankly.

'Our local branch,' explained Peggy. 'We have some awfully good discussions—"Should Men have Pocket-Money?" you know; and "Can Husbands Think?" and that sort of thing. You 'd love it. I 'm hon. sec.'

'But—how is it that I have heard nothing of this before?' asked Armitage dazedly. He felt pained and shocked, as one who, thinking to cull an innocent bluebell, has grasped instead the prickly stem of a bramble.

'Oh, I have to keep it quiet on account of mother,' explained Peggy lightly; 'but as we 're engaged now, I knew you 'd like to know.'

'Yes—oh, rather!' choked Armitage.

'The women of yesterday,' continued Peggy,

'were content to strive for the mere equality of the sexes; that won't do for us girls of to-day. We are out definitely to establish our ascendancy, not only in the home, but in the—er—the Councils of the Nation.'

'Heavens!' groaned Armitage.

'I don't wonder you're stirred to enthusiasm,' said Peggy.

They were approaching now the outskirts of the town, where houses began to overlook the road, and George Armitage's nervousness increased. 'Surely, Miss—er—I should say, Peggy,' he said, 'you do not intend to continue smoking your cigarette openly through the streets?'

Peggy flung the offending weed away contemptuously. 'I suppose I'd better not,' she remarked; 'you have to be so frightfully careful in a place like this, especially when you're single. Wait till I'm married, though. By Jingo, won't I just wake them up! It'll be the beginning of a new era.'

Armitage groaned silently in the spirit.

VI.

He escorted Peggy home, and slowly retraced his steps, striving vainly to regain his shattered mental equipoise. A dark, disintegrating chaos had fallen upon him, filling his soul with perturbation. Where was he, and what did it mean?

George Armitage had never been thoroughly trustful of women; in early youth the painful story in Genesis had made a vivid impression upon his juvenile mind, fortifying the ingrained cautiousness of his nature. But even so, he could not bring himself to regard this glaring manifestation of feminine duplicity with the matter-of-fact cynicism it warranted. Had he been a man addicted to ventures of chance, he would willingly have staked the last coin in the bank's strong-room upon Peggy Uttoxeter's docility and gentleness of disposition. Even now, try as he would, he could not call to mind one single hint in her early unostentatious deportment that should have warned him of the unblushing Fury asleep beneath it. It was preposterous; and he was engaged to be married——

'Hullo, Armitage!' exclaimed a cheerful voice, breaking in upon his anxious reverie. 'You're looking worried, man.'

Armitage started. Before him stood Frederic Knowles, grinning pleasantly. 'Er—good-evening,' he said. 'Yes—business at the bank; great weight on my mind.'

'By the way,' continued Freddy, 'allow me to congratulate you on your engagement. I'm *so* glad, you know—we all are. It's a great relief to her friends.'

'What the dickens do you mean? A relief! What's a relief?' demanded Armitage huskily.

'Oh, nothing—nothing at all,' replied Freddy hurriedly. 'Only, you know, everybody says you're just the man to look after little Peggy Uttoxeter. It's a splendid thing for her.'

'Yes—yes. I suppose she has been a little—er—wild,' said Armitage tentatively.

'Oh, hardly wild,' said Freddy. 'I don't think I'd say *wild*. Of course, she's young, and girls get these peculiar ideas into their heads sometimes. Don't think I mean anything *serious*,' he added hastily. 'Good heavens, no! Just—well—perhaps you'll be just as happy to know nothing about it. I wouldn't worry myself; much better bury these things and make a fresh start. What? I've not the slightest doubt that everything will turn out all right, and you'll be perfectly happy. Well, good-night, and the best of luck;' and Freddy passed on.

Armitage strode on down the deserted road, a prey to an ominous host of doubts and fears. He felt like one standing on the perilous brink of ruin. Should he step back while there was yet time?

At length, anxious and undecided, he arrived home, where he found a note awaiting him. It was addressed in Peggy Uttoxeter's handwriting.

'DEAR OLD EGG' (it said),—'You really must shave off that frightful moustache of yours, old pippin! The Woman's League of Progress considers moustaches the very hall-mark of masculine arrogance, a sort of emblem of man's ridiculous, usurped attitude of superiority over women. None of its members is allowed to marry a man with a moustache; so out with the razor, old radish, and off with the offending monstrosity!—Yours till it snows in Hades, PEGGY.'

Armitage tottered and almost fell. Then, with a magnificent effort, he rose to the full dignity of his manhood. 'Never,' he cried defiantly, clenching his hands—'never will I be so craven-spirited. Let the Woman's League of Progress do its worst;' and sitting down quickly at his desk, he wrote a note regretting that, owing to unforeseen divergences of opinion and temperament, the engagement between Miss Uttoxeter and himself must be considered at an end.

'What an escape!' he gasped, as he placed the letter in an envelope, and moistened the flap with trembling tongue.

VII.

Frederic Knowles sat sideways on his hammock, swinging his legs restlessly to and fro. In front of him stood Peggy, with clenched hands and disorderly mien.

'I tell you, I'm a social pariah, Freddy,' she was saying unhappily. 'People shun me like the plague. Whatever did you say to George Armitage about me?'

'Nothing,' said Freddy. 'I never said a thing. I just sort of hinted, of course, that you were a

trifle—er—eccentric, just to put him off, you know; but I distinctly said it was nothing serious.'

'But I'm an outcast,' wailed Peggy. 'I've just been down the town, and I passed old Mrs Willoughby. She cut me dead, Freddy, and I distinctly saw her shudder when I looked at her. Then I met the curate in the market-place, and when I stopped to speak to him he simply turned tail and ran for his life down a side-street. It's awful.'

'You must have done it jolly well on Armitage,' said Freddy enthusiastically. 'By Jove, you must! I told you we'd pull it off if only you were game to try.'

'But I'm in a worse hole than ever,' cried Peggy. 'People don't think I'm safe to be about.'

'How is your mother taking it?' asked Freddy.

'Prostrate!' replied Peggy. 'Just lies on the sofa muttering something about "jilted by a bank manager—oh, the unnatural child!" She says I'm no daughter of hers.'

'She'll soon come round,' said Freddy cheerfully. 'I've got you out of the Armitage tangle, anyway.'

'And into another,' said Peggy. 'You'd better start getting me out of this, now.'

'The only thing I can suggest,' said Freddy, 'after having disengaged you from one fellow, is to get you engaged to another as rapidly as possible.'

'Good gracious! Who?' cried Peggy, regarding him with eyes big with innocent wonder.

'Well'—— said Frederic, descending from the hammock.

As I said earlier in this story, a proposal is a disconcerting thing for a girl—a most alarming and unnerving experience. Perhaps I should have added, however, that this depends in no small measure on who happens to be making the proposal in question. On occasions it can be quite an enjoyable little function.

. . . . . .

'Freddy,' whispered Peggy.

'Yes,' said Freddy.

'I'm awfully glad *you* haven't got a moustache, Freddy,' she murmured.

Frederic grinned idiotically.

CHILDREN'S STORY-BOOKS.

SOME OLD-FASHIONED TALES.

By Ethel L. M'Pherson.

BY a strange coincidence, John Bunyan and Charles Perrault, the author of *Puss in Boots*, *Red Riding Hood*, and *Cinderella*, were born in the same year (1628). Both wrote especially for children, and if the writer be not greatly mistaken, they were the first who consciously set themselves the task of providing literature for the nursery-folk. The one gave them *Emblems*, a book 'fitted for the use of boys and girls,' a collection of the dreariest, moralising, doggerel verse ever put together; and the other *Les Contes de Fée*, in which in fascinating prose he introduced to them fairy figures till then known only in the homely folk-tales handed down for countless generations.

Of course, quite unconsciously, in *The Pilgrim's Progress* Bunyan told a tale of high adventure, which has never ceased to enthral imaginative childhood; but such was not his intent, and when once he began to write for youth, his pen lost its magic.

Under Puritan rule, the fairies of Shakespeare's England had been banished from hill and woodland, though one likes to believe that, in spite of the ban, they came stealing back in the twilight hour, at the bidding of delightful grannies, to haunt cottage and manor as of yore, and that at 'story-time' *Emblems* found no favour.

Meanwhile, in the more genial atmosphere of France, they were introduced to the Court of Le Roi Soleil by the bewigged and polished M. Perrault, who, in his sixty-ninth year, forsook his classic studies and his controversies with M. Boileau to write a little book which has placed him for ever among the best-loved of the Immortals. But it was an achievement of which he was shy, and instead of acknowledging the authorship, he attributed the stories to the pen of his young son.

However, so great was the success of *Les Contes de Fée* that M. Perrault's example was followed by every Court lady with a ready pen, and the result was a collection of many volumes, known as *Le Cabinet des Fées*.

Fairy-tales became fashionable, but the 'good people' of the woods and the moors took on a new guise, and became very like the ladies and gentlemen of Versailles, living in beautiful palaces, and taking their walks in summer pleasaunces, where crystal waters plashed in marble basins haunted by talking carp.

In course of time these courtly fairy-folk crossed the Channel; but for many a year the children of England knew nothing of fairies in russet or silk, save what they might glean from ballads and folk-tales handed down by oral tradition.

Romance was banned, and the Puritan morality, which was succeeded by the philosophy of the

eighteenth century, produced a crop of books calculated to inspire the luckless youngsters with the 'fear of the Lord and the broomstick,' or to turn them into the most hopeless little prigs.

It is true, the merry pen of Goldsmith relieved the gloom by writing of Tommy Tripp and his dog Jowler. Charles Lamb not only protested against the 'good-boy' stories of the day, but, what was more to the purpose, he wrote *Beauty and the Beast*, and contributed several stories to that delightful volume written by his sister Mary, *Mrs Leicester's School*, in which a group of charming little girls, met together for the first time, tell of the adventures which had befallen them in their short lives. The book now eludes search, but the few stories which may be found in Lamb's collected works give one an idea of its charm.

No wonder he grew impatient with the didactic books of the day, and wrote: '*Goody Two Shoes* is now almost out of print. Mrs Barbauld's stuff has banished all the old classics of the nursery. The shopman at Newberry's hardly deigned to reach them off an old exploded corner of a shelf when Mary asked for them. Mrs Barbauld's and Mrs Trimmer's nonsense lay about in piles.'

Sir Walter Scott was no more friendly than Lamb to the moral-literature of the period, and condemned it roundly. 'The minds of children,' he wrote, 'are, as it were, put into the stocks, like their feet at the dancing-school, and the moral always consists in good conduct being crowned with success. Truth is, I would not give one tear shed over Little Red Riding Hood for all the benefit to be derived from the history of Jemmy Goodchild.'

This is what one might expect from the most romantic spirit of his generation, and the author of *Tales of a Grandfather* to boot. Nevertheless the uplifted finger and warning voice of Mrs Barbauld continued to admonish, and even that gay and charming lady Maria Edgeworth, whose gifts as a story-teller are not to be denied, never forgot that she had a lesson to teach. Unfortunately she had a great respect for the judgment of her father and his friend Mr Thomas Day, that most tiresome of all philosophers, who wrote *Sandford and Merton*, which was no jest in its day, though it has supplied later generations with a butt for their wit. To these gentlemen Maria showed her manuscripts, and allowed them to insert whole passages of improving remarks.

Nevertheless, *The Parents' Assistant*—what a title!—is a most enthralling collection of stories, though one cannot accept the author's judgments. For instance, instead of blaming poor, generous, impetuous little Rosamond, heroine of 'The Purple Jar' and 'The Birthday Present,' one takes a violent dislike to her odious parents, who think of nothing but her lack of prudence, and who glorify all the 'baser virtues.' There are times, however, when one can agree with all one's heart, as in the case of 'Simple Susan,' and rejoice at the discomfiture of the wicked attorney—he is so horribly wicked—and at the rout of the butcher whose knife is at the throat of the pet lamb. All nice children, it seems, kept pet lambs in those days, and Susan, though she possessed too many virtues, was really a dear little girl.

In fine, Miss Edgeworth was an artist, and the blemishes in her work are adventitious.

The same may be said of Mrs Sherwood, author of that fascinating and at the same time horrifying work, *The Fairchild Family*, of which the three closely printed volumes are enough to provide any child with many hours of pure pleasure, if they do not succeed in reducing him to a state of religious hysteria.

Mrs Sherwood does not moralise after the fashion of Maria Edgeworth or Thomas Day, but starts with the atrocious assumption that the heart of every child is black with wickedness, magnifies every childish fault into an ugly sin, and has the Devil always in waiting to throw the unlucky youngsters as fuel to the eternal bonfire. Each chapter concludes with a prayer and a homily of the most gloomy character, and the estimable Mr and Mrs Fairchild encourage little Lucy, the youngest of the trio, to write down at the end of the day not only her evil deeds, but her evil thoughts. To remind three high-spirited children of our mortality the father takes them to look upon a dead body, and to prevent them from bickering he leads them to a gallows from which dangle the bones of a man who slew his brother in a fit of anger. One may well ask what possible merits such a book can possess, and the answer is to be found in the remark of a reviewer made concerning one of her other books; for Mrs Sherwood was a prolific writer. 'It displays,' says the critic, 'an admirable acquaintance with that marvellous little world the youthful heart, and is pervaded by a fine tone of elevated moral principle.' One may question the second part of the estimate, but it is just Mrs Sherwood's acquaintance with the youthful heart which makes her so delightful. In Emily, Henry, and Lucy she has drawn children living, real, and lovable, full of childish faults and childish charm. She enters into their games, takes them into the open air and sunshine—it is invariably summer weather, and the Fairchilds have a pleasant custom of going for picnics, and we are always told of the currant-turnovers and fruit-pies which filled the hamper. We know exactly how the dolls were dressed, and what delightful bits of gay silk came out of Mrs Goodriche's capacious bag of scraps when pin-cushions had to be made. The chase of the pet magpie and Henry's awful adventure with the bull thrill even a jaded 'grown-up.' During the absence of the excellent parents, the children, of course, get up late, neglect to wash, make buttered toast for breakfast, and, crime of crimes, cover the hearth with

greasy crumbs. It is all admirably told, even to the chasing of a pig down the lane. Such doings must have been very annoying in a well-ordered household, but one is hardly prepared to see them brought up for judgment before the throne of Heaven. Yet such was the case.

With *Sandford and Merton* and *The Fairchild Family* the 'improving' story-book reached its zenith, but it was long before it disappeared. Rhymes about *The Lazy Boy, The Proud Girl, The Modest Girl*, and *The Industrious Boy* were still popular, but they were adorned with charming pictures by Leech and Absolon, and in the early 'sixties the eminent 'Crowquill' embellished the tiresome pilgrimage of Gilbert and His Genius, a fat mid-Victorian lady of the ballet, whose slight wings could not possibly have lifted her plump person from the earth, with excellent black-and-white drawings. Not long afterwards Walter Crane began to illustrate the charming tales of George Macdonald, which were to be followed by *The Babies' Opera*, a book of pure beauty which was reissued by subscription a few years ago in all its glory of fine colour and exquisite type.

Then came the immortal picture-books of Randolph Caldecott and the dainty work of Kate Greenaway.

Long before this, however, revolt was in the air, and in 1846 there was published the first of the 'Nonsense Books' of Lear, which are likely to last while the world loves a laugh.

Lear was the literary godfather of Lewis Carroll, and in his rhymes there are clear foreshadowings of the wonderful tongue of the 'Jabberwock.' The student of that language will find its beginnings in the 'slobacious' light of Lear's moon, in the 'galloobious' feet of his sparrow, and in the 'strange and scroobious' ways of his characters.

The hand of 'Alice' gave the death-blow to the didactic story-book; fun, romance, and wonder, surely the birthright of children in all ages, were born anew; and since then childhood has had to its hand a boundless wealth of books to the making of which artists and men of letters have contributed generously, and for the sake of which patient collectors have 'ransacked the ages, spoiled the climes,' to bring to the nursery the fairy-folk of all nations.

THE TWO-STREAM POLICY.

PART II.

III.

NETTIE presented a charming sight the next morning as she walked down the slope to the bank of the river. When she arrived there she gazed around as if in search of something. The serious look in her eyes suddenly changed to one of a more pleasing character as she espied two stones most conveniently placed for use as seats. She approached them, and after a moment's hesitation seated herself and scanned the ground around her. She saw several cigarette-stumps, and in the clay soil the marks of shoe-heels—those of a man, broad and well defined, and of a woman, small and deeply imprinted. She sighed gently, and looked across to the opposite bank without interest; not, apparently, because the scene was a familiar one, but that her eyes betrayed a maiden meditation which was not entirely fancy free. The mellow notes of a bakbakiri shrike calling to his mate came to her from the other side of the river, and she smiled. The immediate response, rich in its variety and sweetness, filled her ears, and betrayed the presence of the mate, in her brilliant green dress, on a branch of a tree close by. Presently the wooer, eager on the love-trail, came across and joined the other, and the watching Nettie saw them kiss as lovers always do. Then she smiled once more.

IV.

The days passed on as is their custom, laggingly for some, over-hasty for others, until the first of the new year arrived, ushered in by a flawless sky and a rosy dawn of such tenderness that Oom Duggie's skin-clad Griqua shepherd, usually callous to beauty and indifferent to nature's finest efforts, looked at it as at a revelation. There had been heavy rains in the Orange Free State, and the Riet and Modder rivers were in full flood, hastening to their union near the railway-bridge, to pour in a united and resistless torrent to augment the waters of their august sister, the Orange.

When his after-lunch nap had braced him for the effort, M'Kay rode over to Mostert's homestead for a talk with his old friend, whom he had not seen for a fortnight, in consequence of a business visit to Cape Town. After the light-hearted greetings so characteristic of their relations M'Kay remarked, 'I sold one hundred and fifty head of your oxen for delivery in March, and about the same number of mine on the same condition, and at the same price. The rains are approaching, and the veld should be in fine trim soon. By March the stock will be fat and fit for slaughter. Then, Klassie, we must take a trip to the coast. The Strand for me every time; Muizenberg is too fashionable.'

'That 's all right, Duggie; and thanks for all you did. March, did you say? It might come off before March. Yes, I think it very likely.'

'We can't get rooms at the Strand before March,' said M'Kay; 'every hotel and boarding-house is booked full until then.'

'I wasn't thinking of the coast trip, Duggie.'

'Of what, then, were you thinking?'

'I was thinking of the efforts that that infernal *rooinek* [red-neck] of a son of yours is making to deprive me of my only child. He is here every night. I was obliged to tell them last evening that I would cut off the oil-supply of the *zitkamer* [sitting-room] lamp. They only smiled. "We must, then, revert to the old custom of the *zit op* [sit up] candle," said Donald. "I'll bring one over."'

'Better let them have the oil, Klaas. The candle idea is a trifle risky. Love burns longer than a *zit op* candle. My wife told me this morning that Donald had got into the habit of solitary evening rides, and I wondered.'

The two old friends smiled happily at each other. 'That old fence is very rickety, Klaas,' said Oom Duggie.

'*Verdoemd* rickety,' said Oom Klaas bilingually.

'Where is Nettie?' inquired M'Kay.

'Where is Donald?' asked Mostert.

'Now that you ask, I remember that he disappeared after breakfast. This is New Year's Day, and I suppose his blood called him to celebrate it.'

'It has, Duggie, I do believe. He has taken Nettie for a ride. Perhaps they have gone to honour the day at Rostoll's Hotel at the Junction.'

M'Kay smiled. 'We have handled this affair with credit,' he said. 'Klaas,' he resumed, with good-humoured raillery, 'you can always depend on a Scotsman for an original idea. I told you how to handle Nettie, and I encouraged you with my iron resolution. Where a Scotsman takes hold he carries a thing through. It is the Scottish spirit.'

'Yes, Duggie,' said Mostert mildly, 'whisky is a strengthening drink.'

For once in his life the ready retort failed M'Kay; or was it that his attention was riveted on the river? 'Look at the Riet,' he exclaimed; 'it is running level with its banks, and the Modder is doing likewise. The junction must be a fine sight. Let us ride down to see. Rostoll's whisky is not bad, Klaas, and we must celebrate the day.'

'Old Montagu Dop for me,' said Klaas, as he turned away to give the order to 'up-saddle.'

V.

They rode together in silence, Mostert puffing contentedly at his pipe, while M'Kay flicked the gnats from his face with an ox-tail. They flushed a covey of partridges, but took no notice. The breaking away of a steenbok, even the harsh scolding of a *knorhaan* (lesser bustard), volubly indignant at being roused from its afternoon siesta, failed to interest them. After a while M'Kay betrayed the trend of his thoughts by saying, 'Did you say they rode to the Junction?'

'I said I thought they did.'

Presently they arrived at Rostoll's, and dismounted. Entering the bar, they called for their favourites.

'*Gezondheid* [Good health],' said Oom Duggie, 'and damn the two-stream policy.'

'*Gezondheid*,' responded Oom Klaas, 'and to the devil with the two-stream policy.—How is the river running at the Junction, Rostoll?'

'Like the gentleman you have just mentioned, Oom Klaas. I have lived here for years, but never saw such a sight. Let us hope that the railway-bridge will hold.'

The two friends mounted and rode down to the tongue of land—the apex of the angle—at which the union of the Riet and the Modder takes place. They reined in on a small rise overlooking the junction of the two rivers.

'What a glorious sight!' said M'Kay. 'Look, Klaas, at that magnificent stream—the result of union, my friend. See the golden colour the sun has imparted to it—golden, Klaas; golden. If the British and Dutch elements in this country would but unite, they would go on to a broader and more tolerant life, with the sun of prosperity shining on them, brightening the current of their lives as the old sun is now glorifying that river.'

'Pray God, Duggie—pray God, it may yet come to pass.'

'Let us hope so. But who are those two people on the very extremity of the point? They are too near the water for safety.'

'Let us ride down and see.'

They proceeded, and presently Mostert stopped with a laugh and pointed to two horses tethered to a bush. 'Nettie's little mare and Donald's gray,' said he gleefully.

Dismounting, they walked towards the point. The seated figures before them, oblivious, apparently, of all but the rushing current, were gazing down-stream towards the railway-bridge.

'That can't be them,' pronounced Mostert. 'Nettie didn't have a white sash around her waist when she left home. She wouldn't wear a sash with a riding-habit.'

'Sash be blowed!' said M'Kay. 'Donald has got a white coat on, and your blessed sash is nothing but'——

'His arm!' interrupted Mostert, slapping his leg in exuberant joy.

'Yes, his arm,' replied the other; 'and that superfluous old fence now dividing our farms is prostrate at last.'

'Prostrate at last,' repeated Mostert emphatically.

'The man,' said M'Kay, 'who invented the two-stream policy, Klaas, failed to take account of one thing—a thing universal, strong, and impossible to control by pronouncements, platitudes, and policies.'

'What—is—that—thing?' inquired Oom Klaas between puffs.

'Love,' replied Oom Duggie, wiping his face with a pink handkerchief.

THE END.

OUR INVASION OF HOLLAND.

BEFORE the war a frontier meant, as a rule, very little to the average tourist, except a somewhat perfunctory examination of his effects by Customs officers, though this often annoyed him, more especially when he was brusquely aroused from his beauty-sleep late at night, or in the dark, early hours of the morning. But at the present time, although we are supposed to be at peace with almost the whole world, a frontier is a barrier which is, in theory, impassable to those who are not provided with a duly viséd passport. And, in theory, it will thus remain impassable until wiser counsels prevail and passports are abolished.

At present the authorities forbid persons unprovided with passports to pass from Belgium into Holland, and *vice versâ*, and it is to be presumed that defiance of these regulations will be punished by most fearful and wonderful penalties; though what on earth these penalties really are no one seems to know.

It suffices to know that at present the crossing of the frontier is, in theory, strictly forbidden, and that trespassers will be prosecuted.

Now, a trespass notice is one of my pet bugbears. Whenever I see such a notice at home I absolutely yearn to trespass, and I am afraid that I have, time and again, defied trespass notices in my country rambles.

I hanker after forbidden fruit.

As a general rule I am a quiet, inoffensive, law-abiding citizen. During the war I implicitly obeyed both the letter and the spirit of the stern behests of Dora, just as I have to obey the stern dictates of my wife.

But there are occasions upon which the Old Adam gets the upper hand, incites me to rebellion, and spurs me on to do the things which I am strictly forbidden to do—though, of course, never dare I flout the commands that 'she who must be obeyed' issues.

Some years ago I had a bad attack of rheumatism, and, among other things, the doctor said that on no account must I drink beer. As a matter of fact I was not in the habit of drinking beer, and I had no desire to drink beer—until it was forbidden. Then my soul was possessed by an intense yearning for bitter beer. This craving gained such a complete hold over me that I promptly adjourned to a hostelry for a pint of bitter.

Then I was satisfied, for I had enjoyed one of the greatest and never-palling pleasures of life—that of disobeying doctor's orders.

So, being lately in the north of Belgium, within a few miles of the Dutch frontier, and having no passport visa to enter Holland, I was filled with a great longing to cross the frontier, and to trespass into prohibited territory.

There was nothing particularly attractive in that part of the country; nevertheless, like the Peri, I yearned to gain an entrance into the forbidden paradise.

I make no claim to be a hero, and yet, in spite of the direst penalties, I determined that, with three reckless comrades, I would invade Holland.

Without passports we invaded Holland, and without passports we escaped from Holland, practically scot-free.

The main road was barred, so we tried the coast. First came an easy walk along the red-tiled Digue to the north of Knocke, then a tramp, not so easy, along the soft sand of the shore, past German barbed wire, guns, and concrete dug-outs. Then, leaving the shore, we had a tiring switchback walk along the sand-dunes, through German trenches, littered with broken crockery and kitchen utensils, with here and there clips of cartridge-cases and the remains of formidable barbed-wire entanglements.

A military 'pill-box' occupied by Belgian soldiers gave us 'furiously to think,' more especially as one of the soldiers seemed to be hurrying down from the mimic fortress to intercept us. But he merely waved his hand and wished us '*Bon jour*,' so we pressed on our way, somewhat apprehensively, for we believed that we were now within a mile of the dread borderline.

A rifle-shot in our direction made us stand absolutely still. Our bravery began to ooze out from the bottoms of our boots, and we were almost inclined to lift up our hands and shout, '*Kamerad*.' But the disappearing white tail of a retreating rabbit, which was almost as scared as we were, seemed to indicate that bunny, and not the British heroes, was the target of the Belgian marksman.

The cessation of barbed wire ought to have made us know that we had crossed the frontier; but as we were under the impression that a creek, some distance ahead, divided the two countries, we walked, with a certain trepidation,

 [*All Rights Reserved.*]

over level, smooth turf, unconscious of the fact that we were indeed in Holland. The revolving sails of two windmills in the distance, together with the summit of a church spire peeping through the trees, bespoke the presence of a village, and, what was more to the point, gave promise of the potentialities of solid and liquid refreshment.

At length we reached the creek which we then believed to be the frontier, but which in fact belonged entirely to Holland. It was low tide, and thus the inlet presented an expanse of firm sand. Out came the camera to preserve a permanent record of the bold adventurers on the point of invading the country.

At the top of the steep grass bank on the opposite side of the creek stood a Dutch outpost —a woman—who watched us carefully and suspiciously. Still, undeterred, we pressed on. The outpost retreated. At the top of the bank there was a good view of the Dutch landscape. The whole character of the country in front of us was different from that which we had just quitted. We were made at once to feel that we were indeed in the Holland that is so well known from paintings and photographs.

All traces of war and of the ravages of war had been left behind. We were indeed in a land which had enjoyed the undisturbed blessings of peace. The land was better tilled; the farm-houses and buildings were larger, neater, and better built; the horses and the cattle were finer. A wide, sluggish canal, which we crossed by an iron bridge, and the causeway along the top of a high dyke, testified to the patient, persistent struggle against natural difficulties. Upon each side of each road was a row of pollarded willows.

As a linguist I am not a distinguished success. My French is excellent at home, but unfortunately when I am abroad no one seems to be able to understand it. When I start to speak people look very sad, and the longer I speak the more miserable do they become—it brings tears to their eyes. In fact, I often wonder what tale of woe I have been telling, more especially when I have been really trying to make a joke.

Of Flemish I have not the slightest knowledge, which is a great disadvantage in those parts of Belgium where only Flemish is spoken. And my Dutch is rather worse than my Flemish.

By the side of a stream sat a small, bespectacled Dutch boy, engaged in watching, or tending, some very quiet Dutch cows. He was an inoffensive boy who had never done me any harm; but I was a stern invader, and had no bowels of mercy. In dress he was very like an English boy, and very unlike the conventional Dutch boy in high, black, peaked cap, blue jeans, and wooden shoes, for he had a cloth cap, a tweed suit, and leather boots. He had done me no harm, but invasion is invasion, and I was pitiless. So I started to torture him most horribly by trying to speak Dutch. He looked scared. But there was no escape for him, and the enemy outnumbered him by four to one. So I persisted, and wished him 'Good-day.' Then I sternly inquired the name of the distant village which we were about to loot, and although we were aliens, he told me. The answer to my question was, of course, a tribute to the excellence of my Dutch, though his understanding may possibly have been assisted by my finger pointing to the windmills.

As the invading army marched along the high-road it passed men and women—mostly women —at work in the fields. They regarded us with absolute indifference, for they merely looked up for a moment, and then resumed their patient toil, unhasting and untiring. Our invasion evidently created no perturbation in their phlegmatic minds. At length we reached the village of Le Retranchment, which consists of two short streets, at the junction of cross-roads, with two windmills, about twoscore cottages, a large school, a church, and that which was very much more important, no less than two public-houses.

There was thus an embarrassment of choice. We selected the more handsome of the two inns, and boldly entered a large room, which reeked of tobacco-smoke, and contained a billiard-table and a small bar. Then serious business began. The proprietor spoke no French, and our Dutch had seen better days. Moreover, there was nothing in the room to which we could point in order to make our wants understood. But I knew one Dutch word, *Schnapps*, which I uttered with the utmost confidence, and the proprietor, with marvellous alacrity, tumbled to the idea that I wished him to join me in a small glass of *Schiedam*. This melted the ice, and made conversation more understandable and more fluent.

A little daughter of the house was called in to assist. She entered the room in her stockinged feet, for, like her elder sister, who smiled at us from the neat and scrupulously clean inner room, and the mother, who beamed at us from underneath a starched white bonnet, she evidently did not wear boots within doors. This young girl knew a little French, which she had learned at school, and acted as interpreter. Like the others, she became very sad before I had finished my introductory speech. We were, however, able to make them understand that we stood in urgent need of victuals and drink; but as we could not tell them the exact nature of the food, we graciously consented to put up with what they could understand. Coffee was, of course, comprehended; but in regard to eatables it was quite another matter, so we compromised on bread and butter, of which two huge piles, of almost Himalayan grandeur, but in reasonably thin slices, were soon forthcoming.

The proprietor was also the head waiter, and he looked the part, in his peaked sailor's cap

and blue-serge suit. Like the orthodox waiter at high-class restaurants, he smoked a short, black, clay pipe, which was warranted to kill at a hundred yards, and this pipe he smoked most vigorously while he attended to the wants of his unexpected guests; though, as a matter of etiquette, he put it down on the edge of our table while he poured out the coffee, but replaced it in his mouth directly this labour was accomplished.

The food was very good and very acceptable. Of course, the inevitable picture post-cards were on sale, and, of course, some were purchased and posted, as evidence that we had really been in Holland.

Then came 'the evil quarter of an hour of Rabelais'—the time for payment of the bill. The proprietor was apparently no dab at arithmetic. He was evidently embarrassed. Taking a half-sheet of note-paper and a short, stumpy piece of black-lead pencil, which he sucked, he called in the services of his daughter as assistant-cashier. After serious thought he made some fearful and wonderful calculations, and totalled the figures, which, for some unknown reason, he divided by two. Then he calmly informed us that the bill amounted to one hundred and sixty-five francs—which even at the existing low value of the franc meant about three pounds ten shillings.

It was now my turn to look sad. Holland was indeed revenged. We had merely wanted to buy a simple meal. It was not our desire to purchase the freehold. There must have been expostulation in my look, for he reconsidered his calculations. It was all those confounded decimals, and he eased the situation by transferring the point one place to the left, thus reducing the bill to sixteen and a half francs (about seven shillings).

Husbands in Holland must be obedient mortals. Indeed, I think that I should make a good Dutch husband.

Wives in Holland seem to be autocratic within the house. In fact, I think that my wife would make a good Dutch wife.

It seems to be the order of the day that shoes must be taken off before the home is entered. On our homeward way to Belgium we passed a small roadside farmhouse, outside which was ranged a row of heavy wooden sabots.

Before crossing the frontier we had one further moment of peril, for we had to encounter the Dutch army. He was, however, very peaceable, and looked peaceable in his neat blue uniform. As we were four to one, we were absolutely unafraid, and as he had his best girl with him, his mind was evidently more intent upon love than war. This terminated our danger.

A weary march along the dunes and sands brought us safely back to Knocke, dog-tired, but triumphant. At the end of the Digue was a garden-seat, a temporary restful haven after toil. With a sigh of relief I sat me down for a short rest. With a sudden ejaculation, not of relief, I promptly rose. That confounded seat had just been painted. I am not a greedy man, but I took far more than my fair share of that white paint back to the hotel, and smelled strongly of petrol the next day.

The municipal paint which I then stole was about the only thing I obtained in Belgium absolutely free of charge. It was also the only penalty inflicted for our unwarrantable invasion of Holland.

But is not the passport system absolute piffle?

THE MOUNTAINOUS MR NEUBURG.

CHAPTER I.—*continued.*

V.

THE little man went on promptly with his hasty and hurtling attack. 'I know—stunning and absurd and incredible. It sounds all that, I know. To me it is all that—only, I've got to face things as they appear to me. I've got to act on the apparently incredible. I've so little to go on, yet so much. A huge fortune, that foolish girl's happiness, and all that sort of thing, are at stake.'

He seemed anxious to impress Clement with the soundness of his case, and it was now Clement who cried, 'But get on with it, man. You haven't too much time. You'll have to go ashore very soon. Tell me the facts.'

'Facts!' snapped the little man. 'The first is, she's going out expressly to find and marry this weak-will, this ne'er-do-well, Henry Gunning.'

'Why? Is she engaged to him?' demanded Clement, with peculiar interest.

'Engaged to him! Good gad—rubbish! Sheer quixotry. This is the story: They were brought up together—boy and girl. He was an unpleasant, feckless cub. His people had estates next old Reys's. Both of 'em went about as kids. There was a sort of calf-love. Both of 'em had it with a mild franticness—nothing else to do in the country for the young but to be calves. Then he did something idiotic, and he was shipped off to Canada. His guardians did it—parents dead then.'

'What was it?'

'Oh, general irritation with his spinelessness and low tastes, plus a crisis. They made use of that crisis. Matter of fact, he stole.'

'Stole! But could Miss Heloise have anything to do with a thief?'

'Oh, but a plausible thief,' snapped the little lawyer. 'With a plausible case. What he stole, he said, was his. As a matter of fact, it wasn't, and he knew it. It was a picture, an Old Master, belonging to his family. Family had died up to its ears in debt—for which his own bad habits were mainly responsible. Everything had been sold to settle those debts. He knew that all right. But he stole that picture, sold it, and went on the spree with the proceeds. There you get the type of man he is in a nutshell.'

'That doesn't explain Miss Reys's attitude.'

'Oh, he made a case. Said he thought he'd taken only what was his own. He bought her a silly little trinket, too, and made her believe he had sold the picture to get that. Absurd. But she was woefully young. She has a generous heart, and she was on the side of the scamp in affection. Well, that's the beginning. He left her with the usual vows. He'd been unlucky. He had an unlucky nature, so he told her; but he was going to the great and grand New World to carve out a fortune for her. He would return, like the hero in a story, rich and powerful, and all because of her—all for her.'

'Well, what next? Has he made that fortune?'

'Not a bit of it. He's the sort that doesn't. Hasn't the guts or the honesty. I don't know what he's done in the ten years he's been away; nobody knows. I suspect a mountain of beastliness. But one thing I know. He hasn't made that fortune.'

'You're sure?'

'My dear lad, isn't that why she's going out? Oh, of course, I'm running on too fast. Well, that *is* the reason, anyhow. First year or two there were plenty of letters. Then the letters dropped away. His were sloppy and disconsolate, I gather. He was the unlucky sort even in Canada, he let her know. Of course he was. Then the letters almost stopped. Then they stopped altogether. For years nothing was heard of him. Things went on with Heloise ever so much better. I thought she'd forgotten the ass. Then, quite suddenly, the whole of this business started again. Came at us, as it were, out of the blue.'

'And what precisely do you mean by that?' Clement asked.

'I can't quite explain. Know nothing definite, you see. First Heloise's father died. Been dead several years now. He left her in control of this fortune. Really an immense fortune. When I mentioned the figure of a million pounds I meant it. It is more than true. Heloise continued for a year or two in a state of happy ordinariness. Then she had another letter from the scallywag Gunning. I don't know what was in it, but it seemed to fling her right back to those old flapperish, calfish days. From what I could gather, Gunning was still fighting his luck. He was fighting (so he hinted) with dogged courage. He remembered his vow to her, and had kept himself staunch, unfettered, and upright because of it. He meant to redeem it. In fact, he hinted that there was a chance of redeeming it, if only his spell of bad luck would break. He had a big thing in view—a huge thing—that would bring him a great fortune. Then he would be able to come to her. But he didn't do more than hint at this big *coup* he had in mind. I told Heloise that that was the man all over; that he was merely exhibiting his vague and spineless nature. Stupid of me to say that. I was set aside as hard and unsympathetic at once, and nothing more was told to me. Heloise, naturally, thought it was his noble nature cropping out. He would tell her nothing until he had brought it off. He would be beholden to nobody until he had fulfilled himself. I said it was all rubbish; but Heloise, who thinks the best of everybody, clung to her view. . . . And then this confounded new companion supported that view, gave it a new strength.'

'How could a companion do any such thing?'

'I can't answer riddles; I can only guess. Perhaps I am too easily suspicious. I suspected the *old* companion when she so inexplicably left Heloise's service. Why? Well, it seemed illogical. She had an extraordinarily well-paid, extraordinarily comfortable job. It was the sort of job no woman of that kind would leave in a hurry. But she did. She said she had come into some money, a lot of it, and wanted to set up a little business on her own. Well, I couldn't find out how she had come into that money—a few thousands it must have been. I tried to trace a source. I couldn't find one. But she had the money from some one all right.'

'You suspect it was an underhand affair—she was paid?'

'I suspect only. No facts. This new companion made me more suspicious. She's a Canadian, or says she is.'

'Perhaps that's the reason Miss Reys chose her—a reason of sentiment,' said Clement.

'You've touched the crucial plausibility of the matter. That *is* why Heloise chose her. The departing companion recommended this creature—suspicious again. Heloise was not altogether smitten with her at first, but the fact that she knew Canada turned the scale. The sentimental note won. And then—too surprising for life, I think: an attractive coincidence, thinks Heloise—this new companion knows Gunning.'

Clement nodded. He, too, was beginning to think that the long arm of coincidence was beginning to suffer from strain. He was beginning to see a deliberate purpose underlying the whole business.

'It only came out casually, says Heloise,' went on the little man; 'but there's the fact—this companion who came to her by fishy means

knew Gunning. Knew him well enough to sing rather an attractive song about him. Oh, she made it all sound very ordinary. She had not *actually* spoken to Gunning or known him personally, but she had stayed at a place called Sicamous, where he was often to be seen, and where his name was very well known. He was known there as the Englishman whom Providence had a grouch against. He was also known as the Englishman who would be a millionaire some day. No, don't ask me why he was called that. That hasn't been told me. I suspect that my attitude of non-sympathy has been adroitly enlarged upon by that confounded companion. I've been kept out of it. All I know is that Heloise is filled with a sort of sentimental certainty that Gunning is out there in the wilds needing help. He is fighting a lone hand against circumstances beyond his strength. He is there working doggedly, with a great chance within his grasp; but for lack of means, for lack of support, for lack of money, he cannot make good. That's how I see it, and I can see how the sentimental side has been worked up to secure Heloise's sympathy. She feels he won't, he doesn't, write to her because of his pride. His self-respect, his sense of decency, his grit, and all that sort of bunkum forbid his writing to the girl he loves and wants to marry. That's how they are playing on Heloise's candid and sympathetic nature.'

'Well,' said Clement, 'it might be correct. Men are rather like that, don't you think?'

'*Men*, yes,' snapped the little lawyer. 'Fellows like you, real men, would be like that. But Gunning—I don't believe it.'

'That's rather drastic.'

'My boy, I know Gunning. We acted for *his* people too. Gunning is not like that. He's a moral tadpole. If he has changed, then the age of miracles has very certainly not passed.'

Clement thought this sort of talk led to nothing. He changed the line.

'And what's the big chance that lies before him?'

'I told you I didn't know,' said the little lawyer. 'I've been kept in the dark over that.'

'Is Miss Reys in the dark?'

'What do you mean by that? As I tell you, I think she is certainly in the dark concerning this foul plot that is being worked on her. But concerning this big *coup* that Gunning is supposed to be able to bring off—no. She knows all about that. She's been writing letters to people in Canada. The companion has supplied her with addresses, I take it. She's received replies that have convinced her of the genuineness of Gunning and his prospects. Of that I am certain.'

'You don't think those letters genuine?'

'I don't think anything connected with this trip to Canada is genuine.'

Clement frowned. Pondering, he said, 'Exactly what do you think these rogues, if they be rogues, are out to do?'

'I think they are out to get control of rather more than a million pounds sterling which at present belongs to Heloise.'

'How will they do that—if she marries Gunning?'

'How will they?' began the little lawyer in exasperation. Then he said more precisely and quietly, 'I will tell you exactly what I think. I think that, somehow, a band of rogues in Canada have found out from Henry Gunning that there is a sort of engagement between him and Heloise. They have learnt from the same source that Heloise is worth a million of money. They have that rascal in their power—it wouldn't be hard to get him in their power. They have seen that through him there is a very good chance of getting that million of money into their power.'

'You're making rather a long shot, aren't you? After all, they must have known that they would have to reckon with Heloise, who will have something to say in the matter.'

The little man waggled his umbrella fiercely.

'Not a long shot,' he insisted. 'They probably saw her letters to him. If they read those letters, they would see exactly the sort of girl Heloise is. She is fine, honest. She is too generous for this world. She is undoubtedly quixotic, as I have told you several times. They would see that a girl like that would respond to adroit handling. Her sense of honour would lead her to remain true to the letter of the bargain she made with Gunning years ago. Her sense of chivalry would send her out post-haste to his aid, if that aid was required. His very air of pride, grit, and reticence would move such a nature enormously. She would feel that he was making a tremendous sacrifice for her, and she would at once be willing to make a tremendous sacrifice in return.'

The little man paused, gazing at Clement.

'That's her nature; generous to folly. She gives greatly, tremendously, if her heart is touched. . . . Well, that's what these brutes have done. As I see it, they have assessed her, sized her up. They have made the most of her good qualities. They have put this plot into motion. Cunningly they have reawakened her interest in Gunning—first, by that letter from him; then they got rid of the old companion, and substituted this—this temptress from Canada. She has spent all her days playing upon Heloise's heart-strings. She has cast a spell, a glamour, a damned romantical glamour, over that poor girl. She has painted a picture of the stoic Gunning fighting against luck for *her*. Painted him proud and silent and full of pluck, refusing to call on her aid, though she has but to stretch out a finger, back up some scheme of his, and he will win—he will win a fortune and win her. Oh, they have painted for

her a beauteous and beastly picture. The sort of picture that can have but one effect on such a girl as Heloise. She has become inspired by it. She sees the great and the generous way. If this true man, Gunning, is too proud to cry for her help, then she should be proud to go to him and help him. She will make her sacrifice also. . . . So—so off she packs to Canada. She starts out like a sort of rapturous female knight-errant to the rescue.'

The little man had to stop, because his face and throat were working.

'And then, when she finds him,' he ended, his voice harsh with emotion, 'there 'll be a love scene—and a marriage—and then—— God knows what *they* will do then; but as sure as I 'm here, Clement Seadon, they 'll get that million—and I daren't ask myself *how they will get it.*'

Clement stood stiff with the tragedy that had suddenly burst in horror into that little cabin.

'I daren't ask myself how they will get that million,' the little lawyer had said with emotion, and Clement shuddered. He saw the gaunt and lonely mountains of Sicamous (wasn't that the place?); the dark, spruce-clad valleys, awfully lonely and awfully quiet. And in those silent valleys away from man—away from help and discovery—anything might happen.

He had a quick vision of the beautiful and splendid girl, and his skin crept with horror of—of the things that might happen.

He found that he had very little to say. He muttered lamely, 'You are sure she is going out for this?'

'To see Gunning? Yes. She told me so frankly.'

'But—but to marry him?'

'I think so. Of course, she wouldn't tell me that, but'—and a gleam in his eye relieved the horror of the moment—'but I, as her lawyer, have been called upon lately to settle heavy bills with all the milliners, dressmakers, and purveyors of dainty feminine apparel in the kingdom of woman's shopping. I don't want to let you into delicate secrets; but, even to the unsophisticated male, such wholesale buying seems to point to one definite end.'

'I am a—a bachelor in such matters,' said Clement, glad to get the topic off the disconcerting strain. 'But even with such preparations woman is not doomed to marriage. After ten years—Henry Gunning may not be likeable. A man of the type you have described is an unpleasant object when he goes to seed—as, no doubt, he has gone to seed.'

'That gives me no ground for hope,' said the little lawyer. 'He is plausible. He will probably get himself up to the scratch for the time being. Even this gang would see to that, don't you think? His very seediness may make him seem more romantic—women are so illogically and amazingly made. And then in a lonely place . . . No; the only safe and settled thing is to prevent the marriage—for you to prevent the marriage.'

Clement laughed with a touch of annoyed self-consciousness. 'After all you 've told me,' he said lamely, 'I 'll keep my eye on her.'

'No—make love to her,' snapped the little lawyer.

'Perhaps I can advise her.'

'Rubbish! Make her love you. Advise her! Good Lord, can any man advise a headstrong, well-educated young woman of the twentieth century? Advise her! Haven't I been advising her not to do this mad thing for months? She 's certain of herself. She 's so practical about the whole matter. Advise her! You might just as well try to advise Mount Popocatepetl to melt into the plain. Don't attempt to advise. Do! Love her. Marry her.'

A sharp voice came swiftly along the gallery outside. A boy, running with some urgency, was yelling a name.

'Marry her, man,' snapped the little lawyer. 'I 'm cut off from her. I can do nothing. I depend on you.' He listened to the boy's yells. 'My name. I 'm wanted.' He sprang to the door, ran up the alley-way to the gallery. 'Boy! Boy! I 'm Mr Hard. Want me?'

A shrill voice yelled, 'Lookin' fer you everywhere, sir. Hurry. Cap'n Heavy's compliments. You gotter get off the ship damn quick. Casting off now. Look sharp, sir.'

The little man swung round, called down the alley-way, into which Clement had come, 'Got to go ashore. Don't forget what you 've got to do.'

'I 'll do my best,' cried the confused Clement.

'Best! No good. Marry her.'

'But, you see, she mightn't'——

'Marry her,' snapped the little lawyer, already on the run. 'Don't give in to her. Make her marry you.'

Running, he passed along the gallery out of sight.

Clement stared after him in bewilderment.

'Holy romance!' he murmured to himself. 'Here 's a thing with which to begin a sea-voyage!'

He turned to go back to his cabin. Away along the gallery, by the staircase that led up to the smoking-room, he saw two men standing. They were standing watching him. They stood there for but a second, and then, with furtive quickness, they stepped back towards the staircase out of his sight.

It had been a matter of an instant. But Clement had recognised both of them.

One was the steward with the evil face who had tried to get the little lawyer off the ship, and had, so Clement felt, tried to get him off the ship, too, by sending his luggage astray.

The other was a tall, huge, almost excessive

man. A man with little, sinister eyes. The man who had all but prevented his getting into the train. The man whom he had seen close to his baggage before it went astray. He was there watching Clement, talking to the evil steward in an intimate way.

'Ah,' reflected Clement; 'so you *are* in this. You are one of them. . . . And now that I come to think things out, there was never any doubt of it.'

Clement Seadon sat down on his bunk to face the problem of saving the girl Heloise from a gang of rogues, of whom the companion, Méduse, this huge man, and the steward at least were members.

(*Continued on page 53.*)

TYPES OF HUMANITY.

I.—OXYPHERIC PEOPLE.

By P. Roualeyn Gordon.

THE human race is composed of all sorts and conditions of people, and no two persons are alike, either physically, mentally, or morally. Some are mentally superior to others; some are physically stronger than others. Some are built on the principle of slowness, their mind and their bodily movements being slow. Others are built on the principle of delicacy. The mind and the body are quick to act. Still others, again, are phlegmatic—nothing seems to arouse them, not even an earthquake. Some are bony—the bones predominate; some are fleshy; and others, again, are nothing but nerves. Hence, broadly speaking, humanity may be divided into different types. Each type is, more or less, a law unto itself. Each type has certain characteristics which are common to that type, although these may be found to some extent in other types, according to the temperament and the constitution of the individual. The word constitution is used to cover the mental, the physical, and all other characteristics appropriate to the particular type. Thus we find that one man is tall, slender, highly intellectual, apparently of a higher type than others. He is of an atrophic constitution, and predisposed to lung troubles, stomach troubles, or disease of the spine. Another man is small in stature, has a head large in proportion to the body, is highly sensitive to all external influences, quick in thought and action, of a fine quality of organisation, has a sedentary disposition and good artistic tastes. He is of a nervous constitution, and subject to diseases of the nervous system or the brain. Still another man is muscular. His muscles are well knit, and his movements suggest steel springs. Here the muscles are the predominating feature, and the man's constitution is said to be muscular. And so on.

The human body is a chemical composition of fourteen chemical elements (oxygen, hydrogen, nitrogen, &c.), and different constitutions carry these elements in different proportions, thus affecting the entire nature of the individual. For instance, in an ordinary man weighing about one hundred and sixty pounds, there is, or should be, oxygen present in the body to the extent of about eighty-nine pounds. Chemical analyses usually differ, simply because one chemist analyses the remains of one man, another chemist analyses the remains of another man, perhaps of a different constitution and temperament. Each chemist reports the existing chemical elements in the body as he finds them. But the chemical analysis of the remains of a man after death may not represent the actual proportion as compared with the chemical elements in that individual when he was in perfect health, or as he was in his period of full growth. The food salts are often broken down during times of disease. The liquids, the oils, the fatty matter may be partially consumed during periods of disease. To obtain the actual proportionate chemical elements in a human being chemical analysis should be made of a man who dies in the bloom of health, during maturity and perfect manhood, after such a man dies suddenly from a blow, a bullet, or an accident. The chemical analysis of the remains of a diseased man necessarily does not tally with the chemical elements in a healthy man.

If, however, the oxygen exists in the body in greater proportion to the other chemical elements than eighty-nine pounds, that man has oxygen in excess in his system, which will affect his characteristics, habits, tendencies, disease tendencies, and everything else. When oxygen predominates very strongly in a certain individual, so much so that he is affected in every direction, his constitution is oxypheric, which means that his system carries oxygen to excess. Such a man is never anæmic; on the contrary, he is plethoric, if anything.

Oxypheric people usually have a large central body from the hips to the shoulders, the body being rounded, heavy, fleshy, and long. The lungs are very large. The face is well developed, and flushes quickly from exercise, emotion, passion. The eyes are blue or blue-gray, sometimes hazel, or gray-green. The man has a youthful appearance even in old age. He is, mainly speaking, the red-faced man. He is full of blood, especially red blood, and it is this superabundance of red blood that gives him the

red complexion so characteristic to him, and so different from all other constitutions. He is very animated and healthy. Indeed, he is so healthy that, if he suffers from any sickness, it is 'health disease,' caused by over-abundance of blood, high blood-pressure, excess of red globules, fibrin, albumin, which may clog the portal system or rupture some of the blood-vessels in the brain.

Not a great many people of this constitution are of the dark races. They are mostly found among white-skinned nations, especially among Germans, Danes, Norwegians, Swedes, Americans, Irish, &c. They may, however, be found among darker races, though not to any great extent. Some of the most successful business men, farmers, orators, brewers, and sailors are of this constitution.

The oxypheric man is very generous, but he dislikes ingratitude worse than he abhors a rattlesnake. He is a very important wheel in the machinery of the world's progress. What would the world do without him? He is the great capitalist, the railway manager, the political reformer, the greatest friend to the labouring classes, although he is often disliked by them. The square-faced, large-necked, heavy-chested, heavy-set captain of industry, who gives work to thousands of workmen and sends his products to all quarters of the globe, is usually of this constitution. The labouring man, the union man, the socialist, the anarchist, and many other people who have small, narrow heads may rail against the oxypheric man, perhaps justly so; but he is, nevertheless, the greatest benefactor and friend to all, whether they know it or not, or whether they believe it or not. Place a large manufacturing concern, a great corporation, a nation, the affairs of a church, or any large paying industry into the hands of a narrow-headed person and see how long it will succeed. The world surely needs the wide-headed, commercial-minded, optimistic, daring, enthusiastic oxypheric man, however wealthy he may be, or however much money he may spend. Without men of this constitution the world would soon suffer in every branch of business, traffic, industry, and commerce.

The oxypheric man can think of the needs of large numbers of workmen better than they can think of their own welfare. He can pick the brains of other men and use their knowledge to his own advantage. He can use men better than they can use themselves. A large body, efficient lungs, tremendous vitality, executive power, talent, mental power, together with great quantities of oxygen in the system—these are needed to use men and matter, or to make things pay, or to strike out on one's own initiative, do pioneer-work of some kind, turn ashes into gold, become a money magnet.

This type of man is very magnetic. He has a strong personality, and, although sometimes so uneducated that he cannot sign his name, he can, nevertheless, mould human wills, direct human effort. As a general rule the oxypheric man is a great worker, but he is not a persistent worker. He can do as much work as three ordinary men when he gets his steam up, but he is not continuous. There are some men, of a different constitution, who never seem to tire; they plod along, day after day, year after year, fixed and unchanging in their habits, like eternity itself. These men are invariably of a high intellectual stamp, slow in movement, patient, sedentary, and unresponsive. They are like a mighty driving-wheel in a power-house—slow to start, but slow to stop when once in motion. The principle of eternity is at work in their very bones. They are the exact opposite of the oxypheric man.

Oxypheric people are under high pressure, dynamos of energy, 'live wires' in every sense of the word. They are like volcanoes; they make steam for brain and sinew like steam-engines. They sweat like a brewery—can actually be seen steaming on a hot day. If they could not convert the internal heat into steam by the evaporation of the perspiration, they would suffer, commit horrible deeds, become very ill. It is very easy for lean prohibitionists, emaciated reformers, starved vegetarians, and high-browed philosophers to condemn beer-drinking, for they do not know what it is to be of an oxypheric constitution. When a man of this constitution is deprived of his beer his system suffers. He must rid his system of internal heat. When he drinks beer, this internal heat is turned into steam through perspiration. It is given off from the body in the form of sweat. Beer-drinking, which is condemnable in most people, has a favourable, sanitary, and disease-preventing effect on most men of this constitution. Yet it is far better for an oxypheric man to make less blood and use foods that are not rich in potash and iron salts, leave meat alone, breathe less by decreasing the lung capacity.

Some people are perpetual, some changeable or fitful, others periodic, still others continuous, but the oxypheric man is climactic. He works steadily almost day and night for a year, or two or three years, when suddenly he breaks down. Then he becomes very ill, but recovers as quickly when his sickness has reached its climax. When he is ill, he wants an army of nurses, half-a-dozen doctors, a whole drug-store in the house, and everybody to wait on him. He is so sure that he will die that he even predicts the day, the hour, and the minute. When that minute comes, however, he does not die. He is the opposite of the atrophic man, who insists that he is well, even when on his death-bed. The atrophic man dies and does not know it.

The characteristics in oxypheric people, among both sexes, at different stages of life, in different climates, and in different environments, may vary a little, but not to any great extent. There

is no type of people similar to the oxypheric, nor is there another type with similar characteristics. Some oxypheric people have their ups-and-downs oftener than others, whether it is a question of success or failure. These ups-and-downs do not depend upon success or failure; they are a natural result of the uneasy oxygen in their system. People of this constitution go to extremes. They may develop very strong appetites for rich, clogging foods, until the fever in their blood comes to boiling-point, when they suffer. Then they go to the other extreme, and perhaps fast for some time. They may adopt a certain mode of life for years until they reach the climax, when they suddenly fall to the opposite point—the nadir. Oxypheric people are cumulative in desire—more, more, still more is written in their constitution—until they get what they feel is enough, which means they have reached the climax, when a reformatory period begins.

Because of their strong personality, people of this constitution are always welcome wherever they go. They are very popular with all classes. It is questionable whether an oxypheric man ever had an enemy, or whether he ever will have an enemy. People may talk about him, envy him, traduce him, plot against him, but nevertheless they all like him, and admire his strong nature.

Oxypheric people are very practical; they like the reality of things. They want to experience life in all its stern reality. Imagination plays no part in their scheme of life. For this reason they want to be always engaged in something of an active nature, something that enables them to mix with the people; they do not like being tied to work which demands close, mental concentration. They are interested in the creation, in all that grows and lives, whether it be human beings, animals, or plants. They are the great executives, organisers, pioneers, systematisers of the human race.

'N'RUNGWI,' THE HAUNT OF FEAR.

By Ralph de Pomerai.

PART I.

I.

'YOU can attempt to account for it how you like,' concluded the baron, 'but as a matter of fact there is no real explanation, and I, for one, have outlived that period of my life in which I was inclined to cherish the fond delusion that everything on this earth was capable of rational explanation. Perhaps I'm too old; maybe it's the tropics; anyhow, those are the actual facts.'

For a few minutes there was a strained and impressive silence. The evening was curiously quiet, and a strange hush seemed to pervade the veld. No sign of life stirred in the bush, whilst even the erstwhile noisy and querulous inhabitants of M'Pana's kraal, situated on a low, isolated *kopje* midway down the *vlei*, seemed to be slumbering. Far away on the western horizon the huge and rugged form of M'Jongwe reared itself, black and forbidding, against the paling splendour of an opalescent sky. In the native police cantonment a solitary dog barked, and then timorously subsided into a weird and plaintive howl. Andrews, the native commissioner, moved his chair uneasily. Marsden meditatively knocked the long-extinguished ashes out of his pipe on the steps of the *stoep*, and in the strained hush the taps sounded almost like hammer-strokes.

The telephone-bell tinkled imperiously and abruptly in the office behind them, and the spell was broken. Schienhanski, more familiarly known as 'the baron,' reawoke to the fact that he was still in command of the M'Rinkwa's outstation of His Majesty's Rhodesian Mounted Police, and bolted inside, calling to MacEwan that it was time for a sundowner. Every one stirred with relief as Mac, a tall, bronzed trooper, proceeded to comply with his chief's request.

'*Gadzema!*'

'*Inkos!*'

'*K'taura envoura, Chimbidza!*'

A few seconds later Gadzema, a broad grin on his ugly, shining countenance, emerged from the entrance of the mess-hut. Attired in the very latest thing in native limbo—a villainous affair in flaming scarlet, rendered more hideous by numerous broad black and yellow stripes—he carried two freshly filled soda siphon-bottles.

Simultaneously the general conversation recommenced, as MacEwan proceeded to affix new sparklet-bulbs to the siphons, while his dusky henchman made the round with the decanter.

'Hm! Of course, that yarn of the baron's about Kiteo's kraal and Johnston's revolver is ancient history to me,' remarked Andrews, 'and, frankly, I have so frequently come into close contact with the occult mystery of native life since I have been engaged in administrative work in this country that I have ceased to regard it as being in any way questionable. The phenomena of telepathy, premonition, and subliminal consciousness may be very little understood and still less recognised, but nevertheless they unquestionably exist.'

'It sounds all right,' I remarked; 'but, after all, the whole thing might have been a pure

coincidence. Kaffirs are pretty much alike, you know, and it doesn't follow because the baron imagined that he had seen old Kiteo before, and subsequently found the revolver in his hut, that Kiteo was the same native about whom he had dreamed. . . . Thanks! Easy with the soda.'

'What about old M'Budzi, then?' intervened Mac. 'For years that old heathen was the terror of the Fumbwe district, and police records attribute at least a couple of dozen deaths to his influence. Some of his victims committed suicide; others died from diseases that defied even the doctor here.'

'In other words, native poison—eh?'

'No; you are wrong there. That explanation will not do,' quietly intervened Marsden. 'I performed a most thorough autopsy in several cases, and found that death had occurred either from a peculiar form of heart failure or from something that curiously resembled premature senile decay. Three patients were nursed in my own hospital, and might easily have recovered save for the fact that they apparently lacked the will to live.'

'Or died of funk resultant from native superstition,' I retorted, with the unconscious egoism of a recently acquired degree and hospital experience. Then, observing that MacEwan was waiting to continue, I queried, 'Any more tales about M'Budzi?'

'Yes. We got sufficient evidence to justify his arrest in the end, and the native commissioners gave the warrant to Stephens, who arrested him at Karonga's kraal. Curiously enough, M'Budzi immediately told Stephens that Andrews had given him the warrant—normally it was the baron's job—and described exactly where and at what time it had been handed to him. He also described precisely what the N.C. was doing at the time. Incidentally he predicted the death of little Jimmy, and you will find it a fairly tall order to convince Andrews that there was no connection between that curse and the subsequent death of his son.'

'I thought Marsden told me that Jimmy died of pneumonia?'

'That's so,' admitted MacEwan.

'Well, where does M'Budzi come in?'

'Look here, young man,' interrupted Andrews somewhat heatedly, 'I don't want to be personal, but you're young, and have been in this country only about five minutes. You may imagine it to be modern and intellectual to sneer at evil influences and black magic, but I, for one, firmly believe that they exist. Say what you will, there are influences about persons and places that vitally affect one. Do you deny that the atmosphere of an old cathedral, in which for centuries our forefathers have worshipped, has a power to inspire or even awe one?'

'No! But'——

'Then why on earth should you deny the effect of the possession of a hideous and grotesque fetish which for years has been the object of fiendish and inhuman devil-worship? If you and I can reach to higher influences, why should a native fail to respond to an evil influence or curse, particularly when he fervently believes in it?'

II.

A lively hum of conversation followed this tirade of Andrews's, and during the next ten or fifteen minutes of heated argument various theories and solutions were keenly contested.

'It's all very well being sceptical,' intervened the baron, who re-emerged from the office at this juncture, 'but you cannot alter facts by refusing to recognise them. Look here, Matthews, if you really do want to hear some genuine and corroborated evidence relative to occult influence, you had better ask the doctor to tell you that affair about N'Rungwi and Camden's suicide.'

Blaygrove, the new pass-officer, and myself both confessed our ignorance of the N'Rungwi episode, while our familiarity with the bare official facts of Camden's suicide had been augmented by the current rumours that something mysterious had been associated with the event. It was popularly stated, moreover, that a peculiar incident, not altogether disconnected with Camden's death, had been the determining factor which had induced Dr Marsden to adopt his present mode of existence.

Marsden was a curious character in many respects. Tall, broad-shouldered, and spare, with keen, meditative, greenish-gray eyes which possessed a peculiar searching quality, hair prematurely iron-gray and thinned at the temples, he was a man who instinctively impressed one even in a crowd. Intense earnestness with a suggestion of sternness was perhaps his predominant characteristic. The jaw was square and determined, at times almost aggressive, yet the mouth and nose were curiously sensitive. His hands were delicate but powerful, the fingers long and slender, and pre-eminently those of a skilful surgeon. A remarkably brilliant student, whose degrees included pure science in addition to medicine, he had won a reputation both in surgery and at the School of Tropical Diseases that was still the envy of his fellow-practitioners in Liverpool and London. He had originally visited South Africa in 1906 on research-work in miner's phthisis. Later he went north on a shooting and scientific expedition, and in the following year suddenly and unexpectedly appeared in the M'Rinkwa's district as a medical missionary. The whole of his not inconsiderable fortune had been expended upon the equipment and upkeep of the M'Rinkwa mission hospital, dispensary, and surgery, and, to quote local comment, he had wasted his whole genius and experience on 'damned unappreciative Kaffirs.'

It was a strange freak, but no one doubted his earnestness. Most of us hated missionaries; but, then, Marsden was not a missionary in the usually accepted sense of the word. The Doc.

never preached—at least, not to us. We who knew him loved him; all respected him; while there was scarcely a European or a native in the whole country-side who was not deeply indebted to him. Naturally enough, then, we all turned to Marsden and demanded his narrative.

'Now then, Doc.,' as Marsden waved aside the proffered glass, 'surely you are not going to refuse a solitary sundowner. It 's up to you to tell this tale, so you might just as well ease it out.'

'All right, then. Just a spot. Thanks!'

Pipes were again lighted, and we all resettled ourselves to hear the Doc.'s story.

III.

'N'Rungwi, as most of you know, is a huge and weird, naked ironstone *kopje*, curiously resembling a hideous crouching dwarf, situated near the edge of the Kharmi Ruins. These ruins are half-buried beneath the dense and tangled tropical undergrowth at the north end of the Kameda swamp. The place is miles from the nearest kraals, and untraversed by any native tracks. For years it has had an evil and unhallowed name among the natives, and nothing on this earth would induce a Mashona to go within a mile of the place, particularly after dark. The whole swamp is fetid and fever-stricken. The very atmosphere reeks with the dank and sickening odour of decomposing foliage. No life stirs save where a loathsome and repugnant *mamba* or puff-adder writhes its sinuous length through the deserted débris. Its last human occupant was Makoma, the fiendish and inhuman witch-doctor, who was chiefly responsible for the late rebellion, and he seems to have selected the place as being the most secluded and awe-inspiring locality suitable for his nefarious and inhuman labours.

'It was in the autumn of 1907 that I left Lord Markham's shooting expedition at Tete—I had accompanied him as medical adviser and scientist—with the intention of crossing the frontier and trekking down to Salisbury, with a view to meeting my brother, who was in practice there. This being my first experience of Rhodesia, I was completely ignorant of the country-side and its inhabitants, my carriers being Portuguese and Blantyre "boys." At Kambudzi's I first heard of the exact location of the Kharmi Ruins, and incidentally learned some of the native stories about that dreaded spot. As a keen student of archæology and anthropology, I had been interested for some years past in these historical remains, and therefore determined to visit them, with the intention of spending a few days at the ruins in exploration and note-taking. You all know that to natives nine deserted habitations out of ten are haunted, particularly after dark, and as these ruins seemed to possess a peculiarly unfavourable reputation, I was not altogether surprised to discover that my "boys" refused point-blank to accompany me on my proposed expedition. I had previously experienced numerous similar superstitious prejudices, however, and being a scientifically trained student, I naturally enough treated their terror with supreme contempt, and made arrangements with my party to await me at Govera's, the nearest kraal south-east of the swamp.

'I reached the neighbourhood of the ruins on the evening of the following day, and, without any preliminary exploration, made my camp upon the summit of a small knoll near the edge of the swamp, and prepared a simple meal for myself prior to turning in for the night. Normally I am a remarkably healthy sleeper, yet curiously enough, dog-tired though I was, that night sleep was absolutely denied me. The atmosphere seemed curiously sultry and oppressive, and I was aware of the ridiculous impression as of some unseen presence, phantom-like and unintelligible. The death-like silence of the place was almost supernatural. The weird, dank chill of the swathing mist reminded me irresistibly of a charnel-house, and aroused almost physical repulsion. The whole thing was ludicrous, yet persistent. Eventually I diagnosed indigestion as the probable cause of my unhealthy mentality and resultant insomnia.

'The following morning I commenced my exploration of the ruins, and moved my simple camp nearer to the *kopje*. One incident occurred in the course of this movement up to the ruins proper which I thought rather amusing at the time, but which later appeared somewhat significant. "Brother," my mastiff, accompanied me on my preliminary exploration. He was erratic and uneasy, and fairly bristled and growled with uncertain ferocity as we explored some of the débris. Finally, as we entered a ruin within which a native hut, still in a fairly good state of preservation, was built, he stopped dead. His ruff bristled and stood on end; his fangs were bared. Suddenly he emitted a short, melancholy howl, and fled precipitately with his tail between his legs. It was over a week before I found him again.'

IV.

'A thick, heavy drizzle set in towards evening; so, preferring the filth and odour of the deserted hut to an attack of malaria, which would necessarily follow such a night spent in the open, I determined to utilise it. At length, in a contented and meditative frame of mind, I opened my pocket Browning and endeavoured to read myself to sleep. For some time, however, I found it impossible to concentrate my attention, strive as I would. Without, the drenching rain lashed the sodden foliage with relentless insistence, while miniature cataracts poured from the sagging eaves with insidious monotony. Occasionally a decayed branch would fall through the saturated undergrowth into the squelching morass with an abrupt and dismal splash, then silence again, and the unceasing pattering of eddying rain.

'A verse in "Rabbi Ben Ezra" eventually attracted my attention, and I soon became enamoured of the poet's philosophic optimism. Poem succeeded poem, until I gradually dropped off to sleep. Rest, however, was short-lived. I dozed fitfully, continually disturbed by ludicrously unpleasant and gruesome dreams, and eventually lay wide awake. Inexplicably my earlier mood had given place to a sense of morbidness, and I felt morally and mentally unhealthy. The very worst side of my nature seemed to predominate. Hours passed as I lay awake staring out into the darkness, while out of a faintly luminous sky the dim form of N'Rungwi leered and brooded. Then I again dropped off to sleep, and spent the remainder of the night in restless, dream-disturbed slumber.

'I have never been able to recall all the precise details of those dreams. Vivid though they were at the time, the majority of them became vague and obscure upon my awakening. Two, however, remained particularly clear and vivid in my memory. In one I seemed to be held under the spell of a hideous, repellent, and emaciated witch-doctor—presumably Makoma—who, in spite of the horror which he inspired, seemed to exert some strange influence and fascination over me. In the other I appeared bound to a horrible, blood-stained sacrificial stone, while over me towered the figure of the chief priest, with knife poised, waiting to deliver the fatal blow. Even now I can almost picture the fierce fanatical hatred and murderous lust that glowed in his wild, bloodshot eyes. Around him stood his bearded, white-robed attendants; while the amphitheatre beyond was thronged with a multitude of prostrate worshippers. Gray dawn tinged the heavens; warm roseate hues flecked the horizon; a solitary ray of livid light outlined the brow of the crouching dwarf N'Rungwi; the sacrificial knife gleamed; and then—cold and trembling, I awoke.

'Slowly the night passed in alternate nightmare and drowsy wakefulness. I endeavoured to sleep, first on one side, then on the other, and eventually discovered that the only position in which I could obtain even comparative peace was by lying on my left side, and thus facing the open doorway. The back of the hut particularly repelled me; the worst menace seemed to lurk there.

'It continued to rain all the following day, and about noon it literally poured. Disgusted, I retired into the hut. It was still unspeakably filthy and odoriferous, but it afforded the only available shelter. The rest of the day I divided between clearing the hut, compiling notes, and preparing my food.'

(*Continued on page 57.*)

THE HAMSTER.

'RAT Weeks' have of late drawn public attention to the immense destruction caused by rats in town and country. The hamster is a plague of which, as yet, we fortunately know nothing here in our tight little island, and long may we remain in ignorance!

The dreaded hamster is creeping slowly but surely across Europe. A hundred years ago this new species of vermin was unknown farther west than Russia. It had originally crossed the Ural Mountains about three hundred years ago, and when the war broke out in 1914 the hamster had spread its way as far west as the Rhine. It was known on the east bank. I do not know if it had been heard of on the west bank, though, without doubt, it will spread there, and—less quickly than the rat, but equally surely—westward to the shores of western France, where the Atlantic alone will stop its farther progress.

The hamster—there is no English name, since, luckily, we have not these pests in our country—is a rat-like animal, midway in size between a rat and a rabbit, browny-gray in colour, rather rounder than a rat, with a half-inch scaly stump of a tail. I have seen many, both alive and dead, and, unless the light is very good, it is easy to mistake the hamster for a large rat. The hamster has cheek-pouches, as have most animals which store their food. During the war the Germans called food-hoarders 'hamsters'—aptly named, too, for the hamster burrows in the open country, making big store-rooms containing grain, potatoes, berries, roots—anything eatable, in fact. The hamster does not burrow very deeply, and horses' hoofs frequently break in their nests and ruin their stores. Farmers say that hamsters once cornered are very vicious, and not many dogs care about tackling them. I once saw a hamster turn furiously in death to bite the carriage-wheel which had run over it. They breed rapidly, and have voracious appetites; once they get a footing on the land, it is extremely difficult to keep down their numbers. A farmer some time ago showed me a 'centner' (a hundredweight) of potatoes, grain, &c. taken from one hamster-burrow, so it is easy to imagine the damage a score of hamsters make on a farm.

Before the war it was a favourite plan for landowners to offer so much a head for hamsters killed; and when soldiers were billeted forty or fifty at a time on big German landlords, many an organised hunt has thinned the hamster population. The soldiers would open the burrow with a spade, kill the inmates with bayonet or spade, and the stolen potatoes, &c., would be taken back to the overseer. I remember in Thuringia seeing a big field after such a hunt. I counted

fifty-eight opened burrows, and was amazed at the aggregate of produce these hamsters had stored.

If a malicious German, during the war, had wanted to harm us seriously, letting loose a few hamsters to breed and spread in England would have done us infinitely more harm than a ton and a half of high-explosive bombs.

It is a curious law of nature that east to west is the law of progress for these creatures. It would be interesting to know the reason. Perhaps civilised man, with his permanent stores of produce, makes a better patron than the half-starved nomad of the eastern plains, and so the rat tribe faithfully follows us west.

In the third century, according to Professor Strong, the first rats entered Europe, crossing the Urals, and slowly but certainly working their way west. About the time of the first George the brown rat first reached our shores. Up till then our native black rat was the only rat we knew. The black rat was smaller, rounder, furrier, less repulsive than the brown rat, which so speedily routed the black one. Farmers say the two species have not interbred.

In closing, it is of interest to recall the Jacobite's horror and loathing of the brown rat—the 'Hanover-rat,' he called it. He claimed that the ship which brought the Hanovers to England first brought the brown rat also to our shores, ousting quickly the 'Catholic black rat' of the Stuarts, and all but exterminating it. Tennyson, in 'Maud,' mentions this:

> Curse me the British vermin, the rat;
> I know not whether he came in the Hanover ship.

Any one who reads Waterton's books to-day cannot fail to be struck by his intense dislike of the brown 'Protestant rat,' then rapidly increasing, and he will be interested in the successful measures the great naturalist took to keep the brown rat out of his estate, and his romantic regret at the threatened disappearance of the gallant little British black rat.

THE CHINOOK 'WAWA.'

By MABEL DURHAM.

I.

CUMTUX Chinook Wawa? No, of course you don't. Unless you had the rich and rare experience of being a sojourner on the Pacific coast in its early days, and sharing in its adventurous and colourful life, you may never even have heard of this strange speech, which, notwithstanding, is one of the linguistic curiosities of modern times. And it is not surprising if you have not, for in the older provinces of Canada, and even in those just east of the Rocky Mountains, there are many people who know nothing of this language, which was evolved to meet the commercial needs of mingled races, and which since the days of Captain Cook has been at one time or another the most widely employed speech on the whole of the Pacific slope from California to Alaska.

It is more than fifteen years ago since, a newcomer to the West, I stood in the general store of a village in the interior of British Columbia, and listened with eager curiosity while an Indian woman and a Chinaman talked animatedly in a language strange to me. I was puzzled as to what that language could be in which those representatives of so widely separated races could converse thus freely.

It seemed incredible that the native woman could have mastered the complex and difficult speech of the Oriental, and almost as unlikely that he could have achieved the gutturals of her tribal tongue. I spoke of it to friends who were old-timers in the West. '*Mika halo cumtux?*' they exclaimed, in affected surprise at my ignorance. 'Why, the Klootchman and the Chink were talking Chinook, of course.'

Even at that time one heard Chinook constantly in camps and villages, especially those in the neighbourhood of which were Indian reservations. But with the growth of big towns and the increase of population, many things which until a few years ago were distinctly typical of the Pacific coast are passing away, and one of them is that strange Esperanto of the natives.

In and near large centres of population it is heard now only on the lips of old Indians, for the younger generation of natives living near these places speak English. Nor is it any longer used in such districts by whites, except old settlers, prospectors, trappers, and those who have spent many years close to the natives, for new-comers to the country have no knowledge of Chinook.

But it is still a standard speech among the Indians of different tribes and the traders dealing with them in remote places, and its use still makes possible intercourse between aboriginal races far removed in point of distance as well as in customs and language. The number of stray words from it that seem to have found a settled place in the colloquial diction of the white dwellers of the Pacific slope show to what an extent the jargon was once used.

II.

If a stranger on the coast were to inquire casually how Chinook had its origin, he would in all probability be told that it was invented by the Hudson's Bay Company as a medium for

communication with the various tribes among whom their traders went. This is the commonly accepted theory concerning the lingua, but it is not correct, as any one will soon discover who takes the trouble to make a study of it and to trace its sources. Although the officials of the Hudson's Bay Company developed it, and, as one might say, organised it, and reduced it to a written form of speech, it really came into being by a process of evolution and in response to the demand of the time, to meet the need of the curious phase of life which resulted when white men and the primitive races first met on the coast.

When Captain Cook left England on his third great voyage to the Pacific Ocean—the object of which was to endeavour to find a north-east passage to the Atlantic, geographers and philosophers still believing that, although all attempts to discover a north-west passage from the other side of the continent had failed, the long-sought route might be found from the Pacific—he had in his company a surgeon named Anderson. This man was also a naturalist of considerable attainments, and at each of the strange lands that were visited in the course of the long voyage he made a close and careful study of the natives, their customs, language, religion, and mode of life, as well as of the flora, fauna, and physical characteristics of the countries.

When the *Resolution* and the *Discovery*, so significantly named, in the spring of 1778 came ploughing their way across the Pacific from the Sandwich Islands, which they had discovered, they sighted Sir Francis Drake's New Albion somewhere off what is now the State of Oregon. But there was no harbour there, and the two little ships struggled on against the fierce March gales toward the north. When land was once more seen they were off the coast of what is now known as Vancouver Island, and there they found a harbour, in which they came to a safe anchorage, of which they were in sore need.

This was Nootka Sound (the name was given to it by Captain Cook), a place which was soon to become known in every country in Europe, and which was the most-frequented harbour on the west coast of North America for a third of a century afterward, at the end of which time it sank back into its prehistoric obscurity until ten years ago, when its name began once more to figure in the records of commerce, not as the source of the rich pelt of the sea-otter, but as a shipping-point for Vancouver Island timber.

When the great navigator, who was the first Englishman to set foot on the west coast of Canada, reached this harbour after his long voyage, his ships were badly in need of repairs. Here he found good water and plenty of timber. So the forges and the mechanics' equipment were set up on shore, some of the tall firs and giant cedars were felled, and the ships were given an overhauling. This work occupied a month.

While it was going forward the commander and the officers engaged in trade with the Indians, who swarmed around the ships in great numbers, making every demonstration of friendship and welcome. They offered for trade the skins of the sea-otter, the animal whose beautiful pelt was afterwards to become the basis of the fur trade on the coast, for which it was so furiously hunted that it is now practically extinct. In exchange the white men gave nails and bits of iron and other metals which were eagerly sought by the natives.

But Anderson employed his time in studying the people of the country, a task to which he brought a high degree of zeal and enthusiasm. He made a list of their words which he found to be in most common use, with their English equivalents. This keen observer who loved the study of mankind was even then in failing health, and before the end of the summer he died on one of the barren Aleutian Islands.

But the list of words which he had compiled at Nootka was published in the official account of the voyage, together with a lengthy description of the habits and manners of the people, which he had prepared in conjunction with Captain Cook, thereby furnishing a record which will always be of the very greatest value to the ethnologist and the anthropologist. This account of the voyage also told of rich sea-otter skins which had been purchased for a handful of nails, and had afterwards been sold for fabulous prices to Chinese merchants when the ships' company were on their way home. It was this news that electrified Europe and started a long line of trading-vessels towards Nootka.

III.

When Captain Vancouver came to the coast, fourteen years after Cook, he had with him the list of words which Anderson had prepared. He used them in talking not only to the Nootkans, but to the Indians on the Straits of Juan de Fuca, Puget Sound, Burrard Inlet, the Gulf of Georgia, and wherever else his explorations took him. When he returned to England he had added many words to Anderson's list. This vocabulary was in the hands of every trader who came to the coast, and it was not long before Indians to whom the words were at first strange began to employ them also.

It was quite natural that they should do so. The well-known word *tyee*, for instance, was the Nootka word for 'chief.' When Vancouver met a chief of another tribe and addressed him thus, he and his people naturally supposed that this was the white man's term for chief, and they were prompt to use it in talking to the next whites who came their way. Likewise, another familiar jargon word, *mowitch*, was Nootka for 'deer.' Traders consulting the list begun by Anderson and enlarged by Vancouver,

when they wanted to know if deer were to be found in the district, said, '*Mowitch? Mowitch?*' with a sweep of the arm to take in the surrounding country. When the natives failed to understand, the strangers made a rude drawing of the animal. Instantly the Indians concluded that *mowitch* was the white men's name for deer, and always afterwards employed it in conversing with them.

As this was what happened with most of the words in the list, although many of them underwent changes and modifications, it will be seen that the common language, which afterwards came to be called Chinook, and has been likened to the lingua franca of the Mediterranean, had its origin in Nootka, for the words from the language of its people were those chiefly in use until Astoria was established at the mouth of the Columbia River in 1811, when Nootka ceased to be the rendezvous of the traders.

Upon the arrival of the Hudson's Bay Company on the coast the new language had already some form, although it was then that it received its chief impulse. The principal post of the company being at the mouth of the Columbia, in the country of the Chinook tribe, it followed that a large addition of their words should be made, as well as those of the Chehalis, a tribe occupying the territory immediately to the north.

Many more English words were now brought in, and French was introduced for the first time. The French-Canadian *voyageurs* who entered the service of the fur companies came in contact more closely with the lives of the natives than any other class of whites. They not only traded with the Indians, but travelled with them, hunted with them, found shelter in their lodges, and for long periods at a time lived with them on terms of close intimacy.

The words adopted from the several languages, both of whites and natives, were those found to be most easily uttered by all, except that objects new to the natives, such as articles of food, clothing, tools, and furniture were given their English or French names, and even in these some modifications in pronunciation had to be made in order to make them adaptable to tongues unaccustomed to the sounds. The gutturals of the Indians which presented difficulties to the whites were softened or dropped, and the 'f' and 'r' of English and French, which the natives were unable to pronounce, were modified into 'p' and 'l.'

A number of words were formed by what ethnologists call onomatopœia, a word formidable in appearance, but simple enough in meaning, merely signifying the imitation of natural sounds to indicate their source. A good example of this is the suggestive *muck-a-muck*, meaning 'food,' or 'to eat,' a meaning it would no doubt readily convey to a primitive people given to the enjoyment of their food without any of the restraints imposed by social amenities. *Lip-lip* was intended to express 'boiling water,' and meant 'to boil;' *tin-tin* signified the ringing of a bell, and hence any musical instrument; *tum-tum*, supposed to represent the beating of the heart, became the name for that organ.

Grammatical forms were reduced to their simplest possible expressions, and variations in mood and tense were conveyed almost entirely by the context.

IV.

The advantages of the curious mixed speech were quickly seen by the Indians, and it became a means of communication between tribes of different tongues, as well as between them and the new-comers. It was even used as such between English and French. It was at first most in vogue in the district near the mouth of the Columbia River, which was until 1843 the headquarters of the Hudson's Bay Company; but as it continued to receive fresh additions and began to assume a distinct and settled form, it gradually spread to the north along the coast, and inland along the Columbia and Fraser Rivers.

Horatio Hale, a distinguished anthropologist, who was a member of the United States exploring expedition which surveyed a portion of the coast in 1841, and who gave a report on the ethnology of Oregon, compiled a vocabulary of the trade-language, giving it at that time two hundred and fifty words.

The discovery of gold in Cariboo brought whites in contact with the tribes of the northern interior over a much wider extent of country than had hitherto been reached by the fur-traders, and the use of the jargon was extended proportionately, so that shortly after the middle of the nineteenth century it was employed throughout the entire territory from California to Alaska and from the Rocky Mountains to the coast, and there were few tribes in which there were not to be found some interpreters through its medium. It had, in fact, become an international speech, widely diffused among the tribes of British Columbia, Washington, Oregon, and Alaska, and of great service not only to traders, but to scientists, missionaries, and travellers. It is also easy to believe that the tribes benefited socially and morally through being able, by means of the conventional speech, to come to a better understanding with each other. Missionaries and students of the native races have made the claim for it that it stimulated friendly intercourse between tribes by enabling them to converse with each other, and that by means of it sworn tribal foes frequently became friends.

As the trade-language travelled north and east its vocabulary increased. In 1863 the Smithsonian Institute of Washington published a dictionary of the Chinook jargon, prepared by George Gibbs, whose collection comprised nearly five hundred words. Two later dictionaries were

published in Victoria, both of which gave about the same number of words. It was almost impossible to state the number with exactitude, for words which were early in use became obsolete later, while in different districts a certain number were locally introduced and not known elsewhere. In spite of its apparent poverty of words and the lack of grammatical forms, it possessed a considerable degree of flexibility and expressiveness, and, difficult of comprehension as this may be, it served almost every need of ordinary intercourse in the life of the past century on the coast.

The ease with which it was acquired, and the promptness with which it was adopted by the native tribes, led to a prevalence in its use that prevented a knowledge being gained of the original Indian languages, none of them being understood or spoken by a white person, with the exception of an occasional pioneer and a few missionaries. In recent years, however, some research-work along this line has been carried on by ethnological societies and other scientific bodies of England, Canada, and the United States.

V.

The language has not been without its literature. The most notable example was the *Kamloops Wawa*, published by Father Le Jeune, a famous missionary to the Indians of the Kamloops district. *Wawa* is the Chinook word for 'talk.' This was a little weekly paper which was published for about three years, beginning in 1891. It was in the Chinook jargon, and in Duployan stenographic characters. The system was learned by Father Le Jeune as a young man in Paris. After having tried, with small success, to teach the Indians to read in English characters, he undertook to teach them through this method of shorthand. He experimented with a boy who was a cripple, and who, through a sort of intuition, learned the system at a single lesson, and afterwards helped to teach it to others. The natives learned it quickly and eagerly, until a large number of the Shuswap, Thompson River, Revelstoke, and Nicola tribes could read in it. The little paper was circulated among them, and was used to convey religious instruction as well as secular information. All the work on it was done by Father Le Jeune, who reproduced it on a mimeograph. In the archives of British Columbia, at Victoria, are to be seen several volumes of this unique journal, which is undoubtedly one of the linguistic curiosities of the human race.

Mr Hale, when he compiled his dictionary in 1841, gave a description of the language as it was then in use in the territory around the mouth of the Columbia River, and said: 'The place at which the jargon is most in use is at Fort Vancouver. At this establishment five languages are spoken by about five hundred persons—namely, the English, the Canadian-French, the Chinook, the Cree, and the Hawaiian. The Cree is the language spoken in the families of many officers and men belonging to the Hudson's Bay Company who have married half-breed wives at the posts east of the Rocky Mountains. The Hawaiian is in use among about one hundred natives of the Sandwich Islands who are employed as labourers about the fort. Besides these five languages there are many others—the Chelalis, the Wallawalla, the Calapools, Nisqually, &c., which are heard daily from the natives who visit the fort for the purpose of trading. Among all these persons there are very few who understand more than two languages, and many who speak only their own. The general communication is, therefore, maintained by means of the jargon, which may be said to be the prevailing idiom. There are Canadians and half-breeds who have married native women, and can only converse with their wives in this speech; and it is a fact, strange as it may seem, that many young children are growing up to whom this factitious language is really the mother-tongue, and who speak it with more readiness and perfection than any other. Could the state of things which exists there be suffered to remain a century longer, the result might be the formation of a race and idiom whose affinities would be a puzzle to the ethnographers. The tide of population which is now turning in that direction will soon overwhelm and absorb all these scattered fragments of peculiar lineage and speech, leaving no trace behind but such as may exist on the written page.'

This prediction has come true only of the district of which it was written, for the lingua still lives and its usefulness continues, although in a region far remote from that in which it received its greatest development.

Mr Hale, writing again on the same subject in 1890, fifty years after he had made his first investigations, seems to have changed his view as to the persistence of the jargon, for he said then: 'There can be no doubt that it will remain a living and useful language so long as the native tribes continue to speak their own dialects. Rude and almost formless as it is, the spontaneous product of the commercial needs of mingled races, it has been the source of great and varied benefits. It may well serve as a model, or at least as a finger-post to direct us to some higher invention for subserving the larger uses of an advanced civilisation. Viewed in this light, and also as presenting one of the most curious specimens of a "mixed language" which philologists have had the opportunity of analysing, the jargon seems to merit a somewhat careful study.'

It is thirty years since this opinion was expressed, and although the use of the strange '*wawa*' is gradually lapsing as civilisation advances, it still serves an important purpose as a means of intertribal communication over a wide area of northern British Columbia.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

SPAIN is attracting an increasing general attention. There are the best of reasons for the remarkable interest being displayed in the country now by those whose attention is significant and of value. We may, then, consider a few aspects of this attitude and the causes of it, with some personal experiences and impressions, recent and acute, following upon previous and lengthy intimacy with the country and its people. It is stupid to suggest that any particular country is the most interesting, or the most attractive, or the most fascinating—all the enticing adjectives—in the world, as is often done in a careless way, for general comparisons are impossible when aspects, characters, and meanings are so different, and there is obvious dependence on the place and circumstances of the observer. How should we decide whether Pekin or Palestine would be the more attractive to an ironmonger of Birmingham, knowing nothing of his mental attitude to such localities, his inclinations, or his tastes? For a number of reasons I feel that the most interesting of all places is our London in its present hectic moods, still centre of world affairs and movements, a mainspring of human action everywhere, displaying on its surface such doubts, hesitations, and anxieties, with a certain recklessness that is born of them, in this period of transition. But in a general sense, recognising that what is old and matured and fixed is nicer for human study and interest than what is new and undeveloped and uncertain, we may look upon Spain as possessing a prime claim to such distinction. In history and institutions, in her art and architecture, in the manners and customs of her people, the character of her cities, the beauty of much of her coast and territory, and in her political and economic circumstance (with some emphasis here), she is scarcely less attractive than any other country, is far more so than many. She is a country waking from a long sleep to which she fell wearily after much misfortune. Her resources are immense, her people have high qualities, and her position in the world as a nation, unhurt by the war, is such that she herself, even as do the critical economists of other nations, feels that she has a period of enormous prosperity before her, can she but rid herself of some political difficulties with which she is afflicted. The cardinal fault of the British people, that they are too insular, too little aware and heedful of great things and movements outside their own island home, too little appreciative of the truth that Britain is not and has not been alone in strength and splendour, has not been diminished to the extent supposed as the result of glances upon war-time maps during the last few years. For just now, when even from the newspapers—which often tell so little—from trade, intellectual and other movements, it is evident that Spain is a fast-rising factor in world considerations, when more public and general interest is taken in her than at any previous time in our lives, there are some asking who and what is Spain, and how comes she with her 'decadence'—a term they have heard vaguely in this connection—to be now of any account. Some of our people often lightly link the name of Spain with a fancy of this 'decadence,' which they could not of themselves explain, and with bull-fights, which are no more of the worthy part of present Spain than prize-fights are of England. At this moment Spain is leaping to a new existence; she visualises a splendid future, and, within the limitations that stupid politics impose upon her, prepares to grasp at opportunity. Instead of speaking of 'decadence' to Spanish friends with whom I am permitted to be frank—Spaniards being at the same time the most sensitive and the most politely courteous of all peoples—I have suggested to them in unflattering sincerity that they are as a phœnix nation, rising again from the ashes of a glorious past, and that they, indeed, may be the first nation in history that, once fallen, has risen again. This is a reasonable idea; but the manager of a British bank in Madrid to whom it was submitted murmured that in a sense it was right, but did not go far enough, for in his view, and that of others, Spain is, after all, and despite her history and achievements, but as a virgin land waiting to be developed and colonised; while, again, he reminded me that the Spaniards, in their hope and pride, look upon their past, with all the great and romantic story of South America belonging to it, as but an incident, little more than an accidental affair, and, with a sublime belief in

 [*All Rights Reserved.*]

a majestic destiny, feel that all their real greatness and achievement have yet to come. Some think they may be at the beginning of the new period now.

* * *

For the student of world affairs, with politics and economics, therefore, also for the traveller, above all for the commercial people, Spain is worth the closest attention now. Let it be stated that many other peoples, and most particularly the Americans—and the Germans, of course—are appreciating this circumstance in a way and to an extent that the British people are not, and much to their advantage, as all may see who wander now in Spain. For Britain it sometimes seems that she considers her appreciation proved and all desirabilities and obligations satisfied by the establishment of a Cervantes chair of Spanish literature at some of her colleges and universities, the practical good of which is found subsequently to be somewhat small. The Americans and the Germans are teaching the Spanish language to as many of their people as will acquire it, and in many cases forcing it on them, for it is one of the three most useful and profitable languages in the world; in some respects it is the best of all. And it is a beautiful language, with a literature that is superb and fascinating. For these and other reasons Spain now becomes an increasingly favourite objective with Continental travellers. They have bent themselves that way as not before. Madrid and Seville and Granada have been thronged with foreign people to an extent unknown in other times—and it has followed that prices have risen high; the innocent may be warned that, vast in interest, Spain is now correspondingly expensive. She is not a country cheap for patronage; much otherwise is it with the Spain of this new time. Yet for the delight and the education and the starting of fascinating and useful thought upon the redevelopment of a great people, the establishment of a curious phase in political history, Spain is cheap to visit, after all—since in our present time we may feel that anything that is really good is cheap. Travelling in this country may be a taste to be developed, but it is one that holds and increases intensely. The introduction to it is sweetened by the circumstance that here is a people that, with all its deficiencies and difficulties, has not had its mind and feelings warped by that wrackful war. Three or four years ago some bleeding nations were prophesying final moral and material ruin for the Spaniards if they also did not fight and bleed. They did not fight—and they are not ruined in body or soul. The nations who fought speak honeyed words to Spain in these new days, and make friends with her.

* * * *

On an afternoon recently in Madrid I sat with Don Juan de la Cierva in his study, talking with him upon some points of the political state of Spain, her needs and prospects. Señor La Cierva is one of the foremost statesmen in Spain, has been Cabinet Minister, and is leader of one of the strongest divisions of the Conservative party. While thus conservative, he is much of a reformer too, seeks for progress in Spain upon historical and traditional lines. He would have abolition of most of the useless politics with which the people are encumbered now, but no revolution or republic. The distant islanders, associating Spain with decadence and bull-fights, suggest also from an impressive ignorance that this nation is always approaching revolution, and that soon it must come. Why they make such suggestion, except as a matter of instinct, they do not know; and the truth is that, many as are the troubles of this people, more and more persistent as becomes the proletariat here as elsewhere, there are few countries that are indeed farther from revolution—however near she be to it. That is largely due to the efficiency and popularity of a first-class king, of whom it is well said that he is the best statesman in his country, and the most sincere and indefatigable in his efforts. And there is no Spaniard who is more conservatively democratic, or who sees better than Don Alfonso the necessity of political reforms. On this afternoon, as we were conversing, I reminded Señor La Cierva that some years ago, when in the same apartment we spoke of Spain from our respective points of view and he taught me much, he lamented the excess of politics and politicians from which his people suffered as the *fons et origo* of most of Spain's perplexities and troubles. It seemed then, and seems more than ever now, that the chief obstruction to real progress is this excess of politics, for most of them are stupid artificial things, matters for fanciful debating, chimeras, useless, far separated from the realities of the period. I suggested now that, while Spain, upon the evidence of my own eyes and notes, has made the most marvellous progress in recent years, the appearance of her towns and cities, especially in the north, having improved amazingly, her people of all classes having acquired new looks of well-being, their natural dignity much enhanced thereby, only the politics seemed not to have improved. Perhaps, indeed, they had become worse. I had sat through afternoons in the Cortes and listened to the demonstrations there, deeply interesting and impressive in their way; had read the newspapers abounding in their political statements and their manifestations of intrigue; and in some way had hobnobbed a little with the politicians themselves, and talked their own politics with the people who follow them, an outstanding impression being the pity of it all, the folly of it, and the unreality. These ideas I submitted to the Spanish statesman.

'It is true,' Señor La Cierva said. 'It is no better than before—it may be worse; but if so, it is perhaps, after all, for good, since it may hasten an inevitable crisis. There must be a complete change in the organisation, complexion, ideals, and efforts of political parties in Spain, so that the necessities and the new opportunities of the country may be accommodated. The dynastic parties, as we have known them, have been violently shaken, but there is still an effort to maintain them. Yet, whatever their merits may have been in former times, they are no longer advantageous or even practicable. The organisation of these old parties in days gone by was really settled on a fiction. They had little or nothing to do with realities; they were concerned with fancies; they established polemics without foundations. Here in Spain matters of national interest and consequence have been dealt with and argued upon, not as living problems of the welfare of a struggling people which urgently demanded practical settlement, but as abstract ideas good for the exercise of parliamentary logic and oratory, and for creating those "crises" upon which Spanish politics have seemed to exist. This has been, therefore, a Spanish world of unrealities, and the whole world now so abounds in realities, grim and stern as not before, that the time for such politics is past. We must face new facts as developed in Spain as elsewhere; we must deal with those vital problems of existence and national welfare raised by the working-classes. The old parties as such cannot deal satisfactorily with these problems. They are in a state of decomposition, and new parties on broad bases, representing the social forces of the time, must be established to take their places.' From this Señor La Cierva, constant and severe critic of all Spanish administrations even when Conservative, spoke of the possibilities and desirabilities of the future. He would have for a Spain that could do herself best justice some reasonably settled form of politics and government which might strive steadily to certain determined and practical ends. Only on a broadly enlightened Conservative basis did he think that Spain could accomplish so much, and so he would have a new Conservative party without inner rivalries and sections, Liberal in spirit, infused with new ideas and with a new spirit, with democratic ideal and programme, national in the best and most practical sense, capable of embracing some political sections now characterised as Liberal. Such a party could satisfy the legitimate expectations of the labour and other classes—though mere revolutionaries would call for something else, as revolutionaries always do. This ideal administration from the Conservative point of view in a land unsmitten and undistracted by the war, though not unaffected by it, is an interesting idea for contemplation as apart from its special application to Spain.

Later in our conversation my candid informant dilated upon the material prospects of his country. He urged that her position is unique, that she has now more *brazos*, more arms, to do her work than ever before. The next census of the population will show that she has twenty-two millions of her own people here at home. There is a decrease in emigration. In these times, the world being condemned to too much taxation, a new prospect is opened to this country. Her expenses are relatively smaller than those of others; she is in a position to make a better economic development of herself. 'Look,' exclaims Señor La Cierva, 'at her vast resources—the big coalfields, development of which only now really commences; the mines of iron, lead, zinc; all the metals, the sulphur and sulphates, the country produces; her waterfalls—everything she needs. Political difficulties must not be permitted to let this great opportunity pass. The signs are encouraging; there is an awakening of effort; the people become keener. The technical schools which are being established everywhere are well attended. We are making many things that only recently we obtained from abroad. We have, for example, begun to make railway-locomotives; we are even making our own railway-carriages and sleeping-cars. Soon all our railway work will be accomplished by ourselves. Agricultural production increases; during the war we did much for other peoples. And despite the excess of politics, the people of Spain are in far better state than they used to be, and they know it. Look at them! They have the appearance of well-being. Better economic conditions make a people look better.' Other leading statesmen, like the Count de Romanones, ex-Premier, and various chiefs in this throbbing period of transition have said much the same things to me. These men are optimists, and not without reason. '*Mañana! Mañana!*' As with the 'decadence' and the bull-fights and the revolutions, other peoples have been told and repeat that in Spain the talk is all of the '*mañana*' and what will then be done, and never of to-day, and what is waiting for performance. There is a little truth in the idea, though not so much as is suggested. But Spain knows that a black night is past, and the dawn breaks bright.

* * *

This conversation—and the line of thought that remembrance of it induces—recalls another I had recently in the south, in Granada, with a man of different situation, outlook, and mood, but not less worth attention. We were seated one night on a terrace on the Alhambra heights. There was a flickering field of the city's lights in the plain below, a strange and somewhat mournful clanging of the bells from cathedral and churches, which seem to answer each other at intervals, and be moaning for times of glory that are past with the heroics of Ferdinand and

Isabella, who are sleeping here; even for the dazzling days of Araby that unhappy Boabdil, last Moorish king, brought to an end when he delivered the keys of Granada to Ferdinand, then crept with his scornful mother, Ayesha, to the hills. The Duke de San Pedro spoke to me on such an enchanting night upon the present state of Spain. He is an extensive landowner, and a great promoter of industrial and agricultural progress in these parts; he belongs to one of the oldest families in Spain, and the Catholic kings gave the duke the title of Conde de Benalua when the Moors were driven from Granada, and it is the title the present duke prefers. He is a highly intelligent man, strongly progressive in every tendency, outspoken, and candid. He is not a politician, and has a very wide outlook. He expressed some views as to foreign relationships, the truth of which I felt and had previously suspected, but of which no politician and few others would ever have ventured to speak. He told me of the new fruitfulness of Granada, how the valley was now producing in abundance, of the great prosperity of the sugar-beet industry he had started, of the land that in 1888 was worth but eleven hundred pesetas an acre, and is now sought for at nine thousand. He spoke of the disappointments of Spain, and the new hopes, and of her resourcefulness and determination. After a pause he remarked meditatively, 'You know you English are rather like ourselves. We two peoples have much in common; we go well together, hardly any better; we should remember that—you should.' The idea quickened me; many times the same impression had come to me. The average Englishman, with old ideas and prejudices strong in him, may consider this as the most stupid thing that ever was said about England and Spain. He will think of the Spain of the past, with its dignity of black and gold marked so much with blood and cruelty (was only Spain so bad?), of the Catholic kings and their Inquisition, of Philip and his Armada, of the tremendous failure of South America after winning it (was only Spain like this?), of the Cuban War, and then of Spaniards old and new in their fanciful forms and characters, such as Cervantes gave them. Then he may think virtuously of the magnificence of the English, and may smile at the idea of a likeness between the minds of these two peoples. Yet it exists. In foreign wanderings I have been impressed by nothing in the appearance and manners of peoples so much as by the similarity between the educated Spaniard and the Englishman. It is as exact as it can be between two different peoples. The Spaniard is a little more tranquil, more meditative and reserved, that is all—if one dare not add that he has the best of it in manners. If in a pageant of the world the people of some other nation had to play the part of England, one would choose the Spaniards for the show. They are, indeed, more like ourselves than the Americans, vastly more so than the French. There is an affinity between England and Spain that one day may be exerted in some new and striking manner. How like, again, are these nations in their histories!—though the histories of nations are never like each other. We in the north of America, Spain in the south, both floundering in arrogance and ignorance leading on to loss; the religious difficulties of a few centuries past, political developments and changes; and if democracy seems less advanced in Spain than in England, still it is the fact that in appearances of constitution and parliamentary system Spain is more like us than any other. The customs of the Cortes are similar, even to the king's speech at the opening of parliaments.

* * *

'If they could be brought to understand it properly,' the Duke de San Pedro said, 'the British people have a great business to do with Spain. The Spanish character and that of your countrymen go well together. We are both peoples of the sea. It is not quite the same as between ourselves and the French. In relation to France our history has been somewhat difficult. France and Spain have been opposed in some of the greatest struggles in Europe. We are not of the same race, and we do not think the same. But the Spanish and British peoples, as may not be generally appreciated, have a common origin, which is Celtic. In considering circumstances and consequences this is important; it is a reason why we have more in common with the English than with the French. A difficulty is that we have not been a commercial people. When the Napoleonic wars were over, Britain would trade with all the world save Spain, never with Spain. I have meditated for long upon that circumstance, and I cannot find an explanation. How was it? The British traders did indeed come to Jerez, but not to the rest of Spain. Why? The French and the Germans set many commercial movements on foot in Spain—railways, tramways, and so forth—but little was done by Britain. How was this? It was strange. The time has come for a change. The Americans are now coming to Spain in large numbers, and sometimes it seems they are taking the place that the Germans had here before the war. If the British wish to take advantage of the opportunity offered them and improve our relationship, commercially and otherwise, they must be speedy. But you English do not seem disposed to any great endeavour in our direction. One so rarely sees the English newspapers in the hotels and other public places; American and French papers are always to be found. In trading matters Britain is too close; she gives too little credit, so much less than others.' The Duke de San Pedro propounded an extensive list of British omissions. The conversation touched upon another phase of Anglo-Spanish

relations, actual, possible, and desirable. 'I think,' he said, 'that the case of Spain is at once interesting and a little difficult, but above all Britain should come to a clear comprehension of it. Spain has always been a nation of the sea. When machinery and industries came along, we were at a disadvantage. We are not by nature engineers, manufacturers, and so forth, even if we are moving somewhat in that direction now. We are sailors. Spain is at the period of a great resurrection. There are signs of great developments in every department of agriculture and industry. Our country is capable of much, but she is not sufficiently industrial, and she must pass through a period of education in this respect. Britain should lead her. It is to the interest of Britain that Spain should be strong. I do not know the mentality of the Foreign Office in London, but I think there must be agreement with what I say now. Difficult questions lie ahead of us, and other nations are interested. I have an idea of my own, and it is that in the future of Europe there will be a powerful triplice of an industrial and anti-war complexion, and it will consist of Britain, Spain, and Italy. I am sixty years of age, an old man, and I shall not see that idea realised, but it should come about—for the interests of us all. I am a civilian and a man of peace. I am an enemy of war. I think it is better to be agreeable and conciliatory with other peoples than to use the stick to them. I believe in reason and not in force, but reason must have an interest. Britain also is a nation preferring peace to war. But France likes war; she is a war-like nation. In the future there will be great difficulty with France. If Spain and Britain are in agreement, it will be good for all. The mentality of the English people is much the same as ours. Spain has been calumniated. She becomes rapidly more democratic. Her formulas and systems might in many ways be compared with yours. It has been urged against us that we are too much Germanophile. It is not true. At the Court, indeed, there are Germanophiles, but not men—señoras. And, of course, there are the clergy; but in general it is not so much that there are Germanophiles as that there are Francophobes. Such a distinction must not be overlooked.' . . . In that sensuous night at Granada, stirring to the imagination, prospects shaped themselves fantastically as one looked through the blue between the stars above and the twinkling lights of Granada down below.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER II.

I.

CLEMENT SEADON got up from his bunk almost as soon as he had sat down on it. He was young; that is, he preferred swift action to deep thinking.

'It's no good arguing about this,' he told himself. 'It's no good telling one's cautious soul that outside the cinematograph and the painted pages of fiction pretty young women *aren't* the victims of gangs of rogues in this the twentieth century. She is. I've seen her. I've seen the gang, and already felt them at work. I've had circumstantial evidence pumped into me by that hurtling little lawyer. It all sounds mad. It all sounds untrue. But it happens to be true. I've got to do something.'

He made a stride towards the door. He stopped.

'Ah, yes,' he reflected; 'I've got to do something—*what?*'

He suddenly realised how easy it was to say, 'I've got to do something;' how hard it was to do anything at all.

What could he do? Rush out and confront the gang with their villainies—idiotic idea. He'd probably be put into irons as an irresponsible madman. Accusing people wholesale of crime isn't done—anyhow, not with impunity—if there's no evidence. And there wasn't any evidence. If there had been any, the little lawyer would have acted upon it; the criminal gang would have been slapped into jail before the ship sailed. Heloise—what a really suitable name for her, Heloise; how it fitted her curious, slim, rather *exalté* kind of beauty!—Heloise would have been rescued even before she started for Canada. The voyage would not have been undertaken.

On second thoughts he was rather glad there had been no evidence. Gang or no gang, it was rather pleasant to think that Heloise Reys really would be with him on the *Empress* until they all reached Quebec. . . . And perhaps he'd be with her longer.

'All the same,' he reflected, 'this isn't going to be so simple as it looks. I only know indirectly that there is a gang at work to ensnare Heloise Reys and her money by means of a quixotic marriage with the scallywag Henry Gunning. Nothing to go on except suspicion. Also, I must remember that Heloise herself is, to all intents and purposes, on the side of the gang. She wants to get to Henry Gunning and marry him. She regards the one member of the gang she knows, this Gorgon companion, Méduse, not as an enemy, but as a tried, helpful, and trusted friend. If I do unpleasant and senseless things to the gang, I make Heloise my enemy, through the Gorgon. . . . Oh, it's infer-

nally complicated. This isn't a matter for clumsy, rough-and-tumble methods. This is a matter for wits, for brain-work, for guileful intelligence. . . . However, I fancy I have a good share of guileful intelligence.'

As a matter of fact Clement was doing himself rather less than justice. He had rather more than his fair share of keen wits; only, as one of his friends said, 'one never noticed it because he was so well tailored.'

Clement Seadon was one of those young Anglo-Saxons—and their number is not so inconsiderable as our enemies imagined—who were responsible for so many German failures during the war. They were so entirely unlike the things they were capable of doing.

Clement, for example, looked indolent. He looked easy-going. He looked as if he cared for nothing very much, and hadn't any particular intelligence. He was obviously very careful about the set of his clothes, and could be guaranteed to shine adequately in most sports and at any social gathering. He had blunt but neat features that conspired to give him a suggestion of geniality not easily moved from a habitual calm. People felt they could not take him quite seriously—until they suddenly bumped up against an extremely disconcerting and swift coolness of wit. Only then, when they had been 'stung,' as the Americans say, did they note the squareness of the jaw and the lips, and the square and quite definite power of his brow.

In the same way not a few men had learnt, to their cost, that the lean and beautifully-turned-out young man was not at all the dandy he looked. The leanness was the leanness of perfect fitness; the gracefulness was the grace not merely of muscles in superb trim, but of muscles that could function with abrupt efficiency, and, if necessary, with quite appalling force and painfulness. Too late many men had noted the strong lines of his tall figure, and the flat, thick shoulders that betokened a stayer.

Clement Seadon, in fact, was rather a drastic sort of young man to those who thought he didn't matter very much. In the Diplomacy where he had served before the war, several quite brilliant brains had chuckled at him for an amiable and well-dressed ninny, whom it was ridiculously easy to twist round the finger. They had thought this until a sharp reprimand from their Governments, and on some occasions instant dismissal, taught them that some people are not so simple as they look, and that the cheerful young man who had seemed to them so easy a victim had actually been twisting them round *his* well-manicured fingers all the time—not they him.

Clement was not in Diplomacy now; he had thrown up his job to go to the front. His father, his only relative, had died during the war, so that after the Armistice he had found himself in complete control of a very useful income, and with it a freedom to indulge his love of travel and sport, which, up to the war, he had been able to assuage only intermittently.

He was, then, a young man entirely free to do as he liked; a young man who preferred action, who did not ask for adventure, but wasn't so very sorry when adventure came along; and also a young man who knew quite well how to employ the considerable mental faculties he happened to possess. He was, as the little lawyer had felt, quite the luckiest ally Heloise could find in a battle against the powers of crime.

Clement, thinking near his door, turned the matter over. He must do something, but obviously he must do it carefully if he was to defeat the gang and to retain Heloise's good opinion at the same time.

'And obviously,' he thought, 'that means I can do nothing just at present. I can't strike at them until I know, until I find out their plot and have proof that they are criminals. What then? Consolidate my position with Heloise? Blessed word "consolidate." That's the first and only move. I must get to know her better; I must get her to trust in me. I must become intimate.'

At that thought he suddenly switched round and shook his fist at the place where he thought Liverpool must stand. The sound of machinery had told him some time ago that the ship had begun to move.

'Why *did* you talk of marriage?' he said with irritation, obviously referring to the little, headlong lawyer. 'Marry the girl! Marry her! That actually complicates things. I shall —I mean, I *should* feel just as much an adventurer, a conspirator, as this Henry Gunning person if I did—if I ever thought of doing such a thing.' And then, with the inconsequence of the young, he said, 'But she *is* astonishingly pretty and good company. . . . Oh, hang! that only makes it worse.'

As a matter of fact he really did feel that it would tie his hands, where, indeed, he had no desire to have his hands tied. He had already had a dim awareness that falling in love with Heloise Reys would not be an astonishingly difficult matter. He had felt this, vaguely, at their first meeting in the shipping-office. But to have the thing forced upon him, as the little lawyer had forced it upon him, was to make him feel like a plotter. It would add an underhand motive to an emotion he required to be free and genuine. It did worse than that. It made him a conspirator of a mean kind, for he was asked to enter the lists against a lover—or at any rate a sort of sweetheart—who was already in possession; he was asked deliberately to 'cut out' this nebulous, and probably iniquitous, Henry Gunning.

'Marry her!' he muttered. 'That's quite absurd, of course. I mean—well, it is quite absurd. She's got her mind set on Henry Gunning—and she wouldn't care tuppence

for a fellow like me. Indecent to think she would. . . . No; marriage is a bee in that old lawyer's bonnet. But I'll help. I'll do all I can to help her. And that's the first move; I'll now lay the solid foundations upon which real friendship can be based.'

He went very quickly to the door of his cabin. 'The first move, and I know how to make it.'

He went rapidly along the gallery. As he passed along the balcony that overhung the dining-saloon, he looked down at a little group of people collected about one of the tables near the door. Yes, old Maxwell was already filling up tables, and a few of the travel-wise were selecting them. Clement smiled to himself. He was glad he was travel-wise himself.

But before he got to the end of the gallery he was pulled up in his stride. His way was blocked by a very large, a very solid, a very immovable man. There was no getting past *this* human mountain. And the back of the human mountain was towards him, and he was obviously deep in some most absorbing contemplation. Clement said gently, 'If you don't mind.' And then he said, 'Sorry; do you mind my passing?' And then he said, 'Would you mind getting out of the way?' Then he touched the human mass on the shoulder, and shouted in his ear, 'I'm through. I've said everything I can remember. The next move's with you. Just move!'

The dinosaur heaved a little. There was a perceptible undulation over its surface. A voice came back: 'What's that?'

'I want to pass,' said Clement.

'Eh?'

'I want to'——

But Clement did not finish. The mass, as though the thing that had held its attention had suddenly released it, came round with an almost dismaying swiftness. 'How could such a bulk actuate with such rapidity?' Clement thought. A large man stood in front of Clement, bowing and apologising. A large man who seemed genial only on the surface, whose eyes were astonishingly close together, and looked steadily, not into Clement's eyes, but at something mystical across his shoulder. It was the large, fat man who had nearly caused him to miss his train, who had been somehow connected with the mishap to his luggage; the large, fat man who seemed instinctively to mix himself up in Clement's accidents.

'I owe you a thousand apologies,' said the big man pleasantly and without the slightest sense of feeling. 'I did not know you were behind me.' He smiled sleekly. 'It seems that I am foredoomed to stand in your way, sir.'

'That,' Clement's mind told him at once—'that is a threat—or a warning.' And he answered in his pleasantest, young-fellow-about-town voice, 'Does seem a habit of mine to come stealing up behind, so to speak.'

('And that,' he told himself, 'is also a threat, or a warning. Only, he won't see it. I'm much too well dressed.')

'Ah, behind, that has an ominous ring. Let us hope it is not ominous,' smiled the large man with his artificial geniality, and he stepped aside and let Clement by.

And Clement went on musing, 'But, by Jove! he *did* see. That was another warning. I shall have to keep my eyes on that large fellow. He, too, has wits and doesn't look it.'

As he spoke he turned and ran down the accommodation-stairs towards the dining-saloon deck. On that deck he received another small shock. Coming through the swing-doors of the saloon was the Gorgon. She came out briskly with the gait of an old traveller. She saw Clement, and she smiled. Clement thought it to be a smile with malice behind it. It was a smile of meaning. As she passed him she nodded, and said brightly, 'Well, we've started, then.'

A commonplace remark; one of the ordinary, stupid, current phrases of travellers by liner. It referred, possibly, to the fact that the ship had sailed, that the voyage had started. It might mean only that. On the other hand, it mightn't. In the light of that smile Clement reserved his judgment until he had gone into the saloon.

He greeted Maxwell, the chief steward, as an old friend, and asked if there were any good tables left.

'Nearly all the good tables,' said Maxwell. 'Not many old travellers on this trip. Very few have come along to choose dinner-accommodation. You can take almost anything you like.'

But Clement did not take what he liked. He examined the chart of tables, and saw that what he liked had already gone. What he had planned, what was going to be his first move, was to sit at the same table as Heloise Reys. That is, he had schemed to be her companion at meals all through the voyage. That was the recognised move of the wise and old traveller. But he had not been wise quickly enough. As he looked down the chart he saw the names 'Miss Heloise Reys,' 'Miss Méduse Smythe,' already inscribed.

And Miss Heloise Reys and Miss Méduse Smythe were to occupy a small table, a table that would accommodate only two.

He would not sit intimately with the girl at meals throughout the voyage. He had received his first check. He understood why the large, fat man had blocked his way. He understood why the Gorgon had smiled in that meaning way. She had been able to nip in ahead of him and secure a table that would cut him off from Heloise at least at meal-time—that time of singular intimacy. Indeed, that was the meaning of the Gorgon's smile, and her words, 'We've started, then.'

They had started the game of wits, and the first trick was against him.

(Continued on page 78.)

HOUSING SCHEMES OF ANOTHER KIND.

WERE there any 'good old days'? In answering this oft-repeated question one cannot help recalling the famous retort of Mark Lemon when asked, 'Is *Punch* as good as it was?' Said he, 'It never was,' and the remark might well be applied to the alleged deterioration of modern 'days.' Men of old may have lived on inordinate quantities of beef and beer, and gone about cracking other men's skulls in the most merry fashion; but it is equally probable that their wives complained of the exorbitant charges levied by the butchers, the bakers, and the leeches.

That there were some lucky folk then, as now, we have ample evidence; and in view of present-day difficulties with regard to housing, it is interesting to recall how by exercising their wits some people managed not only to 'feather their nest' at some one else's expense, but even to provide themselves with the nest itself.

A doubtful example of such seizure of opportunity is afforded by Swinsty Hall, a fine old mansion near Harrogate. Tradition says that the hall was built by a poor weaver who happened to visit London during a time of plague. The inhabitants had fled, and in their haste had dropped many valuable pieces of jewellery and ornament. Fellow-fugitives would not dare touch these articles, lest they should carry the awful infection; but the poor weaver from Yorkshire, nothing loath, collected a whole wagon-load, carried them to his home, washed them in Green Well Spring, and with the proceeds bought an adjoining estate, and built thereon the present hall.

Opportune action of a different sort caused a grateful monarch to bestow on its owner the manor of Archer's Court, near Dover. In days gone by our kings confined their activities to dry land as much as possible. When they did go to sea, therefore, it will be readily understood that they were quickly in need of assistance. Hence we find that Archer's Court was granted on condition that its owner should 'hold the king's head when he passes to Calais and by the workings of the sea,' &c. Fortunately for the present holder of the manor, we have a sailor-king, who does not require the services of a steward!

Scotland affords several instances of curious holdings. On the borders of Inverness-shire is a small tarn known as Loch-na-Chlaidheimh, a name which is pronounced *Clive*, and means 'Sword Loch.' Into this pool, some five centuries ago, the Earl of Athol cast his sword, at the same time renouncing in favour of the Camerons all claim to the adjacent lands until his weapon should be recovered. Nowadays a strict guard would probably have to be kept over such a loch after an Excalibur had been hurled into its depths, and doubtless similar measures for the protection of the property were taken then, for in 1826, when a small boy fished up a rusty sword, the Lochaber men quickly seized it and threw it back, lest its production should, at least, involve them in lawsuits.

Another Cameron would appear to be rapidly losing hopes of holding his property many years more, for the original charter gave it to him only for so long as snow lay on Ben Nevis. This really raises another question dealing with our changing conditions. Old men will still relate with pride how they built bonfires on the Thames and did other remarkable things during the 'hard winter' of such a date; the most arctic memory of the present generation would probably be the time when almost three inches of snow lay in Hyde Park. But in the days when the slopes of Ben Nevis were given to the Cameron, snow and 'the Monarch of Britain' were generally regarded as inseparable. Since then we have had several mild winters and hot summers, and on at least one occasion the owner had to erect a little tent to protect the last remaining patches of snow from the burning rays of the sun. It will be interesting to see whether, next time snow is getting scarce, the owner of the lands adopts the expedient of stuffing a vacuum flask with snow and leaving that on the mountain-side, as a more modern way of fulfilling the conditions of his charter!

Londoners will recall that annually in October the Corporation of the city renders to the Crown quit-rent services for two places alluded to as 'The Moor, in the County of Salop,' and 'The Forge, in the Parish of St Clement Danes.' The precise site of these properties does not appear to be known, though 'The Forge' is presumed to have been in the Temple. The rent for 'The Moor' is paid in the following manner. The city solicitor, in the presence of the king's remembrancer, produces two bundles of twigs, and with lusty blows severs one with a hatchet and the other with a bill-hook. This being done, the representative of the king pronounces it a good service, and, lo! another year's rent is paid. The service for 'The Forge' is even more simple, the city solicitor merely producing six horse-shoes and sixty-one horseshoe-nails, which are formally counted by the king's remembrancer, and accepted as the rent for that year. His Majesty, by the way, does not appear to have availed himself of recent legislation to demand ninety nails, or even one extra horseshoe!

Equally simple are the rent services by which are held the palaces of Blenheim and Strathfieldsaye. For the former the presentation at Windsor of a banner bearing the lilies of France (in reference to the army vanquished by the

Duke of Marlborough) is considered adequate service; for the latter a replica of the banner carried by Napoleon's army at Waterloo is presented.

In conclusion, we may relate a good yarn that is told of a dispute as to property boundary between the Mackintoshes and Dunmaglass. 'Dunmaglass undertook to produce a man who would decide on oath the exact boundary, under penalty of being buried alive if he swore falsely. The man, on being brought to the spot, swore by the head beneath his bonnet and the earth beneath his feet that he stood on Dunmaglass's land. Inspection of his shoes and headgear showed that he had partly filled the former with soil from the acknowledged property of Dunmaglass, and that he had a cock's head in his bonnet. The Mackintoshes adjudged him guilty of perjury, and inflicted the penalty agreed upon' (Ward, Lock, & Co.'s *Guide to the Highlands*). The spot is known to this day as 'Living Man's Glen,' and is near Moy Station.

'N'RUNGWI,' THE HAUNT OF FEAR.

PART II.

V.

'I RETIRED at an early hour that evening, for, frankly, I was beginning to feel the lack of my two previous nights' rest; but, dead-tired though I was, sleep was impossible. Again I felt, with actual physical repulsion, the dank, shivering cold of the place. The very air breathed of death and decay, and behind it all lurked that ghastly, unseen, and intangible mystery that frequently induced in me an involuntary shudder. Pipe succeeded pipe, until at length I fell into a disturbed, nightmare-distorted slumber, only to awake with the first thrill of sheer physical terror that I had experienced since I was a boy.

'Something was bending over me, strangling me. Something loathsome, nauseating, and overpowering. I awoke, suffocating, gasping, fighting for breath, and struggling furiously. My hands were clenched, my chest bared, my eyeballs hot, strained, and misty. My blood pulsed and throbbed tumultuously, and a sensation as of intolerable weight oppressed my chest. Then came a visual impression of a hideous and grotesque form, a crouching, distorted, and satanic presence that brooded and glowered above me within a bare foot of my face, and was dimly discernible as a black and opaque shade, impalpable, yet faintly defined against the luminous darkness. I can never hope to depict the horror of it, as it crouched there, fiendish, shadowy, and intangible. Sheer terror froze my blood and paralysed my vitality. I tried to call out, fighting against a choking sensation in my throat, but no sound save an unnatural gurgling sob escaped my lips; and then, with a fiendish and sardonic peal of horrible laughter, that awful hovering form seemed to dissipate into the surrounding gloom, and in my distraught and morbid imagination I fancied that I could hear slow, ponderous, and deliberate retreating footsteps. It is impossible to tell how long my bodily paralysis lasted, but at length it passed, and my brain slowly cleared. My hands were still clenched, my body literally ached, nothing constricted my throat or chest, and yet so real and vivid was the apparition that I sprang from my blankets, groping for my torch and revolver, and staggered to the decrepit doorway.

'No sign of life stirred. The death-like stillness was unbroken save for the melancholy swirl of driving rain. Feverishly I encircled the hut, but the glare of my torch failed to disclose any trace of footprints in the soft, saturated mud. Wet and trembling, I returned to the warmth of my blankets, where I lay, rigid and immobile, peering out into the forbidding gloom. The menace of the place was awful; the night seemed blacker than before; while, framed by the entrance of the doorway, a silhouette against the exterior gloom, the ugly, squat, and hideous form of the brooding dwarf N'Rungwi seemed to bend over towards me, and to leer at me with vindictive and triumphal malice in the wan moonlight. I shall never forget the interminable remaining hours of that ghastly night. I was conscious of no actual physical danger, but rather of an awful atmosphere of accumulated repellent and revolting crime. I was overpowered by a sense of the incarnate presence of utter depravity and sordid evil. The place seemed to have become the storm-centre of all the hideous wickedness of countless æons of time, sapping my vitality, and dragging me down to its own depths of loathsome infamy. Insidiously my *moral* weakened, and then—dawn came, and I fled.'

VI.

'For hours I walked through pouring rain and drenching undergrowth, drinking in God's fresh air. Later I returned for breakfast, and determined to leave the place forthwith. This decision once made, I immediately proceeded to carry it into effect, and commenced to collect my impedimenta as a preliminary to departure. It was during these preparations that I discovered this little morocco note-book stowed away in the wickerwork of the hut fabric. It is, as you see,

Camden's diary. It records his visit to the ruins, and ends with these words:

'"*Evil itself seems to pervade this place. A sordid depravity is fouling my very soul. God! the horror of this place is driving me mad.*"

'Thrilled at my discovery, I read and re-read this diary. It contained record of far more than a mere account of the ruins. Among his personal reminiscences the names of M'Budzi and several other witch-doctors were mentioned. There could be little doubt but that for years past Camden had been attracted, fascinated, and yet at the same time repelled and disgusted, by his close personal contact with the darker side of native life. Patently the man was a perfect linguist and a walking encyclopædia of native superstitions and customs, his knowledge being all the more intimate owing to the fact that he had taken a native wife.

'Intimate association with native life had apparently proved his undoing, and in spite of his natural repugnance, he had eventually succumbed to the unhealthy fascinations of black magic, and to a number of morbid native superstitions. As a medical man he provided an interesting study in psychiatry, and although I knew nothing of Camden—apart from his journal—at that time, and had no idea that he was dead, yet even then I dreaded to picture to myself the result of the episode upon such a temperament as his. Ample evidence existed in the diary to indicate that he had deliberately visited the ruins in spite of the fact that he was fully aware of their past history and reputedly unholy influence, for an entry dated 15th December read:

'"*Back with Mamena once more, and yet I solemnly vowed that I would never return. Last night I talked with old M'Pana again, only to discover that he can still influence me as much as ever: strive against it as I may, there is something in that old heathen's magic that awes and fascinates me. The 'boys' swear that he is even more powerful than M'Budzi; certainly he is cleverer in concealing his handiwork. I wonder what he actually meant by all that strange jargon of his about the crouching dwarf of the Kharmi Ruins and my approaching fate. Is it possible that I shall visit N'Rungwi after all? The very threat half fascinates me. Perhaps Mamena's pleadings may hold me back . . . and yet, I wonder?*"

'I feared the worst, and therefore it was no surprise to me when, many months later, I became possessed of the actual facts relative to his death.'

VII.

'I meditated upon these events for a long time, comparing the records of Camden's impressions of the ruins with my own. I came to regard that diary as being additional evidence to my own experiences. At first I had not been wholly convinced that the affair might not have been the result of my own morbid imagination, but now the evidence seemed conclusive. Continued self-deception was impossible. Scepticism and rationalism had broken down before the awful mental reality of the previous night, and I, who had always prided myself on my healthy disbelief in the existence of disembodied evil, had for the first time in my life been literally confronted with the grim horror of its reality.

'I determined that, in order to preserve my moral self-respect, I could not afford to flee from this thing. In spite of my natural repugnance, I felt that it had to be faced, and that my higher self insisted that, if there existed an outside power of evil, it was equally certain that there must exist an exterior force of good. I cannot attempt to explain these conclusions, entirely foreign as they were to my usual logical and scientific analysis of fact. Yet so strong were these subconscious convictions that I determined to act upon them. In spite of all these excellent intentions, however, I undoubtedly dreaded the ordeal all that day until night actually arrived.

'Never before in my life had I deemed myself to be in any way superstitious, but perhaps, after all, hidden away somewhere within me, there existed an odd strain of sentimental bias. Whatever the cause may have been, the fact remains that I placed an old crucifix of my mother's, which I had in my possession, around my neck that night—I still wear it—and that I derived more confidence from it than even the most superstitious Mashona could have gained from the possession of a native charm. Incidentally I moved my improvised bed from its original position across to the entrance of the hut, so that I lay with my head practically in the open air.

'I prayed that night—a thing which I had not done for many years. My conceptions reached a higher plane than I had deemed possible. It is true that the dogmas of my old, though hitherto purely nominal, religion presented almost insurmountable difficulties to me, and yet instinctively I seemed to perceive their underlying beauty and central significance. I evinced no special enthusiasm for any particular form of religion, nor did I attach any importance to any specified theological system. My only tangible impression was that of a conscious realisation of good and evil, and a positive conviction that the good was stronger and more powerful than the evil. Furthermore, I realised for the first time the awful horror and tragedy that perpetually hovered at the back of all native life, and determined forthwith to devote the remainder of my life to its amelioration. I had no desire to seek native proselytes, but longed to assist them in combating their superstitious fears and prejudices.'

VIII.

'I lay in this meditative mood for several hours, experiencing an indescribable thrill of mental and physical exhilaration. Gradually I realised that I was excessively tired. A period of lassitude, physical exhaustion, and insidious mental numbness followed. Then the subtle influence of the place again commenced to impress me. Stronger and more menacing it grew. I pulled myself together with an effort. It was a fight now, and the struggle lasted all that night. Once, in the moment of my greatest weakness and deadliest fear, my fingers unconsciously clasped the little crucifix around my neck, and then, like a flash, I recalled the old power which I possessed when a mere child: the ability to send messages to, and receive them from, my mother. It was a form of telepathy often indulged in between us in my childhood, and I now recalled how, when she had given me the crucifix, she had bade me remember this strange link between us, and if ever in dire necessity to endeavour to avail myself of it. Trembling, I summoned all my remaining vitality and will-power, and sent out a feverish mental appeal. Again and again I renewed the effort, until I lay back utterly exhausted. Then came the subtle and intangible knowledge of answering aid, and the worst menace passed. True, that awful presence remained, but it now seemed to be held at a distance.

'Gradually I regained confidence. The sheer horror and abject fear disappeared. Then came a conscious realisation of immunity and power. Suddenly the presence seemed to fade, and again I fancied that I could hear those slow, deliberate, and retreating footsteps. Towards dawn I fell into a dreamless sleep, my first rest for four days.

'It was then Thursday, but in order further to convince myself of my immunity from the influence of the place, I remained at the ruins for two days longer. On Friday morning I made a thorough exploration of the neighbourhood. Around the débris containing the derelict Kaffir hut I discovered the remains of what was obviously an ancient ruined temple. The bases of many of the larger monoliths still remained in a state of fairly good preservation, and it was comparatively easy to reconstruct mentally the general plan of the original building. It had been an open-air affair apparently, possibly something after the nature of Stonehenge. The main axis of the temple lay north-east to south-west—in other words, roughly on a diagonal between the rising sun and N'Rungwi. The deserted hut, which I subsequently discovered to have been the infamous haunt of Makoma, lay nearly at its centre; while almost completely buried, with its lower extremity actually beneath the mud wall of the back of the hut, I unearthed the ancient sacrificial stone.

'I left the ruins early on Saturday morning, and late that evening rejoined my party at Govera's kraal. I was only just in time, moreover, for, thoroughly alarmed by my protracted absence, and fully convinced that I had paid the penalty for my insane rashness, my carriers had made preparations to vacate the kraal at dawn on the following day.

'Two months after my return to Salisbury I received a letter from my sister. You can all read it later, and you will notice that she states how, on the morning of 10th August, my mother was peculiarly weak and ill, it being found necessary to summon a physician. My old friend Dr Menzies was eventually summoned. He was plainly perplexed, and could only diagnose complete physical exhaustion, until my mother described to him how she had been awakened during the previous night by the sound of my voice, and how, being fully convinced that I was in terrible danger, she had focussed her whole strength in a desperate effort to assist me. The date of my vision at the ruins was 9th August.'

IX.

'Six months later I opened my medical station in this district, and here I heard for the first time the official account of Camden's death from old Sergeant Grahame.

'Camden, you will remember, was out on the North-East Frontier Patrol when he met his death, and very few facts were available. Jeri, his native police-sergeant, gave the only official account of the accident. It appears from his narrative that Camden set out alone at dawn on the morning of 16th January, leaving his carriers and "Black Watch" "boys" at Gumenjeri's kraal, five miles east of N'Rungwi, having made arrangements to meet them at M'Futa's kraal, some eight miles south-west of the ruins, on the evening of the following day. Sergeant Jeri and the rest of the patrol proceeded to this spot as arranged, but Camden failed to arrive until two days later. He had lost his horse, and according to the natives was looking wild, haggard, and dishevelled. From that hour onwards a change was observed in him. Jeri stated that he believed the *baas* to be bewitched. Instead of being his usual jovial self—his native popularity has never been equalled in this district—he was vile-tempered and suspicious. Frequently he flew into fits of ungovernable passion, so that none dared approach him. On the following day he became weak and dejected, and seemed to be suffering from fever. His "boys" made a *m'chilla*, and started to carry him back to M'Rinkwa's. Three hours later he suddenly sprang from the *m'chilla*, snatched his shot-gun from a carrier, and madly opened fire upon his following. Jeri was hit in the leg, one of the native police killed, and a carrier mortally wounded. Camden then bolted into the bush and disappeared. Later another report was heard,

and shortly afterwards a native trooper discovered the body in some undergrowth, lying beside his empty shot-gun. Camden's toe was near the trigger, and the skull was terribly shattered.

'Those, I think, are the bare facts of the case. I offer no solution. My life bears out my own convictions. I will leave you to interpret the episode as you may feel disposed.'

. . . . . .

For a few moments we smoked in silence, a semicircle of indistinct figures, dimly perceptible in the luminous darkness of the *stoep*, with features warmly outlined from the ruddy glow of half-a-dozen pipes. Low on the horizon a huge African moon raised its glowing face above the dim *umtassas*. The stars seemed unnaturally bright and distant; the barrack square gleamed white and ghostly in the gloaming; and intermingled with the unceasing strident song of a myriad crickets was distinguishable the monotonous croaking of innumerable bull-frogs.

Mechanically Marsden raised his empty glass. Silently Andrews reached for the decanter.

'Say when, Doc.'

THE END.

IN THE GREAT WATERS.

By Henry Hilton Brown.

LOCHROMICH was a parish divided against itself. Roman Catholics equalled Protestants; and although the different sections of Protestants probably disliked each other more than they disliked the Catholics, still on social matters they united and presented a solid front. Their pastors threw no oil on the troubled waters.

The Reverend Angus Macdonald, the Roman Catholic priest, was a good specimen of his class—a scholar, urbane, courteous, kind-hearted, yet an uncompromising son of the Church. The parish minister, the Reverend John Main, was the son of a Lossiemouth fisherman. A fisherman's son rarely deserts the sea; but John's mother had dreamed a dream, and had set her heart upon her first-born entering the Church. The wife is the business head of a fisher family, and so the matter was settled. The mother's desire was not realised without difficulty, but the long vacations of the Scottish university course permitted John to earn part of his living by sailing in his father's boat during several months of the year. Incidentally, and what is more pertinent to this tale, he gained such experience of practical seamanship that his father used to say, 'Gin John binna fit to steer his fowk through the strait gate, he's fit to steer a boat through ony gate in the Mora' Firth.'

At college John Main became inspired with a zeal and a fury against what he deemed the errors of the Church of Rome, such as was more common in the sixteenth century than in the nineteenth. When he was placed at Lochromich he found wide scope for his zeal, and frequent opportunity for raising his testimony. Sunday after Sunday he preached against the Pope, the Roman Catholics, and the doctrines which they held. Father Macdonald accepted the challenge, and replied with force. This state of war continued for a year or two, and Lochromich, as we said, was a parish divided against itself.

The 6th of November 1894 is a great day in the Lochromich calendar. That morning Father Macdonald sailed for Inchona to minister to a dying shepherd. He had scarcely reached the island when the wind veered round and rose to a gale. Big rollers coming in from the Atlantic foretold what was to be. About three o'clock a fisherman with a very white face brought word to the manse that the Father's boat was wrecked on the Black Skerry, a reef two miles off Lochromich, exposed at low water, but covered at high tide. The boatman and the priest had scrambled on to the Skerry, and were for the moment safe, but in a couple of hours the rollers would be sweeping over them.

The minister hurried down to the little pier. Men and women, silent and hopeless, were gazing towards the Black Skerry. They knew the danger, and so did John Main. A boat with the present wind could go to the Skerry and take off the priest and the boatman, but could not regain the harbour. The harbour is a poor one at best, and with a north-west gale inaccessible. The village occupies the only break in a rock-bound coast. There was, indeed, another practicable landing-place, but it was a terrible alternative. About a mile south of Lochromich harbour a wedge-shaped cleft splits the 400-feet cliffs, and runs inland for several hundred yards, terminating in a spit of shingle. The place is called in Gaelic Uaimh-nan-Uriskin, 'the Goblins' Cave.' From the cleft a narrow passage through bristling reefs and skerries leads out to sea. Smugglers have landed cargo there, but not on such a night. John Main knew that, difficult as it was, this landing-place gave hope of saving the priest and the boatman, and he resolved to try it.

Rejecting offers of assistance from men whose lives he was unwilling to risk, he told them to go round to the Uaimh and kindle a fire in the centre of the shingle spit, so that he might have a point to steer upon after dark. He laid aside his hat, coat, shoes, and stockings, and pushed

off alone in one of the smaller boats, hoisting as much sail as he dared. Cautiously approaching under the lee of the Black Skerry, he took off the priest and the boatman, and turned the boat's head towards the precipices. The boat rushed through the water, impelled by the gale, the little sail she carried almost burying her in the great seas. Darkness fell, but a gleam of light indicated the position of the Uaimh. Waves thundered on the cliffs, and spouted fifty feet upwards in snow-white spray which showed even in the dusk. Great billows, dark-green and foam-streaked, dashed up the narrow channel and broke with the noise of thunder on the shingle beach.

As the boat passed between the headlands the minister signalled to the boatman to lower sail. No words could be heard amidst the uproar of wind and sea. The boat shot into the channel of the Uaimh on the crest of a mighty wave. Barefoot and bare-headed, John Main stood up gripping the tiller—a Lossiemouth fisherman once more, stout-hearted, clear-eyed, steady-handed. Gallant fellows! In the old days the present writer knew many such; doubtless their sons are like them. The fire, built by men who knew that three lives depended on its accuracy of line, glanced on the wet rocks and shining seaweed, and scared the wild-fowl, and sent them screaming from their shelters on the ledges of the cliffs more than a hundred feet above. Onward the boat rushed past tangle-covered reefs, now almost grazing the ragged sides, coated with mussels and barnacles, and again narrowly escaping destruction upon a knife-edge in mid-channel. At last the breaker smashed on the shingle with a fearful crash and a roar of sliding pebbles. The boat whirled over and over like a toy, flinging her crew into the surf. But willing hands were ready. Half-a-dozen roped men dashed into the water and dragged ashore minister, priest, and boatman, amidst the cheers of Protestants and Roman Catholics.

So John Main justified his father's opinion by showing that he was fit to steer a boat through a very tight place. It is not for us to judge whether he justified the rest of the old man's saying, but it is certain that Lochromich is no longer a parish divided against itself. Minister and priest retain their doctrine, but with greater charity, and the people live in peace. If a cloud rises one will ask, 'Do ye mind the Uaimh-nan-Uriskin?' and amidst a hearty response of 'Aye, aye, that was a great day,' the temporary shadow fades away.

THE MONTH: SCIENCE AND ARTS.

THE MOTOR SEA-SLED—A NEW FORM OF AEROPLANE-CARRIER.

ALTHOUGH one might naturally suppose that our navy, in its employment of aircraft, would make use only of flying-boats, as being the most suitable type of flying-machine for fighting and scouting at sea, this was not entirely the case during the war, land-machines being carried by some of our fighting-ships, and flown from tracks along the decks or from platforms over the gun-turrets. The land-aeroplane is much lighter than the flying-boat, and can, therefore, climb more quickly, fly higher, and carry bigger loads. It can also manœuvre more effectively than its sea counterpart—a vital factor in air-fighting. So important are these advantages that the United States naval authorities have lately experimented with land-aeroplanes carried on and flown from a very fast type of motor-boat. This boat, known as the 'sea-sled,' is of unusual design. If a boat were cut in halves along the line of the keel, and the halves were placed side by side with the half-keels outermost, they would give a form of hull somewhat resembling the sea-sled. (Of course, the outsides would have to be planked.) The resemblance is very close at the bow, but the inverted V form dies away to a flat bottom astern. The propellers are exceedingly unusual, in that only the lower parts are immersed, the shafts, and even the bosses, being above the water-line. On the decks of these craft aeroplanes are carried, being secured by special releasing-gear which can be brought into operation immediately the speed is sufficient for flight. The sea-sled tried recently was fifty feet in length, and was propelled by four motors, each developing four hundred horse-power, and driving a separate propeller. Secrecy was maintained regarding the speed realised, but it could not have been far short of sixty miles an hour. In any case, it was enough to enable the aeroplane to rise. Naturally the speed was increased by the propellers of the aeroplane. One advantage over the flying-boat possessed by the aeroplane is that the latter, when mounted on a sea-sled, can be flown in weather that no flying-boat could face, the sea-sled, in spite of its high speed, being an excellent sea-boat. Had the war lasted long enough, it was the intention of the United States Navy to fly aeroplanes from motor-boats off the German coast for the purpose of bombing the cities of northern Germany.

THE MAKING OF CONCRETE PIPES.

Pipes made of reinforced concrete have been used for many years past for conveying water and sewage, this material being much less costly than iron or steel. Until recently such pipes

have been cast in moulds, but a centrifugal process, originated in Australia, has been lately introduced into this country whereby the cost of the pipes is lessened and better results are achieved. A tube, of which the bore equals the outside diameter of the pipe to be made, is carried horizontally on friction-wheels, and provision is made for rotating it at a high speed. After a cage of steel reinforcement has been put into the tube, a ring, equal in thickness to the concrete pipe, is fixed inside each end. While the tube is rotating, enough wet concrete is introduced to form the pipe, and this spreads out to a uniform thickness, the excess of water running off at the ends. Rotation is continued until the inside surface of the pipe is practically dry. Owing to the centrifugal force developed, the concrete is pressed against the mould and becomes very dense, while the inside and outside surfaces are highly finished. Pipes up to twelve feet in length can be produced by the new process, plant for working which is being laid down in Great Britain.

WAVE TRANSMISSION OF POWER.

Whatever form of prime mover be used to generate power, whether a steam, a gas, or an oil engine, or one operated by water or wind, the power has to be transmitted to the machinery to be driven. For short distances shafts, belts, or ropes are employed, but for long transmissions the only means hitherto available have been electricity, compressed air, a vacuum, and water or other liquid under pressure. For transmitting rotary motion electricity stands supreme, but the driving of reciprocating machines by such means is not so satisfactory. Recently a new form of connection between a prime mover and the machine to be driven has been invented, this being known as wave transmission, for which the medium is water, or some other liquid. In order to understand the principles upon which wave transmission of power is based, a trough of water may be imagined having at one end a float which is moved up and down by the prime mover, causing a series of waves to pass along the surface of the water. If a similar float was placed at the other end, it would be worked by the waves, and could be made to give out power. It will be understood that the water does not move along the trough, but each particle follows an elliptical path, as is the case with ordinary sea-waves. Only very small powers could be transmitted in this way, and wave transmission, although similar in so far that the water does not move along the connecting-pipe, is based on a different form of wave. As is well known, water is slightly compressible, and this fact is taken advantage of to set up a series of small compression-waves along a stout pipe containing water. At the prime-mover end a small piston is reciprocated at about forty strokes a second, and sets up compression-waves, these being utilised at the other end of the pipe to drive machines, such as rock-drills and riveting-hammers. The only serious competitor in such work is compressed air, which is much more cumbersome in use and involves far bigger losses between the power put in and that available for useful work. The piston and the hammer for the rock-drill or the riveter are in one piece, and they give a series of blows corresponding with the strokes of the piston driven by the prime mover—that is, at the rate of forty per second. The strokes of the hammer are very short, being about two centimetres in length, or some four-fifths of an inch. At a recent trial between power transmitted by waves and compressed air, a hole forty-seven and a half inches deep was drilled in Cornish granite in thirteen minutes by the former, the operation demanding about twelve horse-power. The compressed-air drill took fifteen minutes to make a similar hole, the horse-power required being twenty-seven. The length of the transmission-pipe was sixty feet in each case. For wave transmission a flexible steel pipe has been devised, which is made up of short lengths having spherical joints. It is very strong, so as to withstand the high pressure used, and consequently is far less liable to damage than the hose commonly in use for compressed air. The invention of a Rumanian engineer, Mr George Constantinesco, wave transmission was first used on aeroplanes to fire from machine-guns between the blades of the propellers, some thirty thousand sets of equipment being made for this purpose.

A NEW DEVICE FOR DEFEATING CAR THIEVES.

Many ingenious devices have been invented to defeat the operations of motor-car thieves. One of the most recent consists of a small steel case, measuring 12 in. by 9½ in. by 4½ in., which contains a powerful long-range electric hooter, with a note of such a character that the police would be attracted immediately it was heard. The slightest shaking or movement of the car operates the hooter. It is impossible even to remove loose articles, such as rugs, from a car containing this case without causing the hooter to give the alarm, if the person touches the car in effecting the removal. The instrument may be affixed to any part of the car. When the switch is at neutral, the instrument is quite unaffected by vibration or movement; but when the switch is turned on, which is effected by inserting and turning a Yale key, the hooter-operating device is almost uncannily sensitive. The Scotland Yard authorities, who have witnessed a demonstration of this appliance, state that it is considerably superior to any for a similar purpose which has been brought to their notice; further, that they are prepared to bring the final model before the notice of their officers, who will be instructed to stop any car giving the warning signal. It may be added

that the alarm is also adaptable for the protection of banks, post-offices, houses, warehouses, and other buildings.

AN ECONOMICAL HEATER FOR ROOMS.

The vast increase in the cost of heat for domestic purposes, whether derived from gas, coal, or electricity, which began during the war has given a great impetus to the invention of heating devices that are more economical than the open fire or the ordinary gas-stove. Among recent appliances for effecting this object is a gas-heater which is said to be capable of warming continuously for twenty-four hours a room having a capacity of 1500 cubic feet at a cost of 6d., the price of gas being reckoned at 4s. 2d. per thousand feet. The apparatus consists of a vertical tube varying in height from 3 feet to nearly 5 feet, according to the different sizes of the appliance. At the bottom of this tube is a bunsen gas-burner, surmounted by a firebrick cone. Outside of the tube is a cylinder, of such a size as to leave a narrow space between the two. Cold air from the outside of the building is admitted to the bottom of the outer cylinder, becomes heated in its passage upwards by contact with the inner tube or heater, and is discharged into the room at the top, thus both heating and ventilating it. The outer cylinder may be enclosed in ornamental wood panelling to suit the style of decoration in the room to be warmed. Four standard sizes of the heater are made for rooms with capacities varying from 1000 to 6000 cubic feet. The consumption of gas in the smallest size is 5 feet per hour, that in the largest 12 feet per hour.

REVIVAL OF CONCRETE SHIPBUILDING.

In spite of the set-back to concrete shipbuilding caused by the suspension of work on the Government barges and tugs after the Armistice, and the failure of these vessels in service, the concrete ship is by no means a back-number at the present time. Quite recently a concrete motor-vessel, capable of carrying 2200 tons, and having engines of 1280 horse-power, was built at Saigon, and is now in commission. Seven concrete ships are being built for the United States War Department, each with engines of 1100 horse-power; while the first of several tank-steamers, each of which will carry 7500 tons of oil, was recently launched. Hitherto excessive weight has been the chief drawback to the use of concrete in shipbuilding, but this difficulty is being overcome in two directions. First, lighter concrete is being made by mixing the Portland cement with coke or burnt clay instead of with sand and gravel, the weight per cubic foot being thereby reduced from 150 lb. to 110 lb.; second, with what is known as the unit system of construction, thinner skins are passed by Lloyd's and other classifying bodies. These developments have greatly reduced the weight of concrete ships without detracting from their strength, and they are now considerably lighter than wooden vessels with a like capacity for cargo. The behaviour of concrete ships in bad weather at sea is said to be excellent, and for some inexplicable reason they require less power to propel them at a given speed. Another advantageous feature is that barnacles and weeds do not grow nearly so fast on concrete ships as is the case with those of wood and steel, and the concrete is much more easily cleaned. The most outstanding feature of concrete ships, however, is their low cost for repairs and upkeep. For example, a 5000-ton concrete ship had a hole knocked in her side recently by collision with another vessel, but the damage is said to have been made good by a bricklayer and his mate for five pounds. Concrete ships are being built in this country and in Scandinavia at a lower cost than vessels of steel and wood.

WOODEN WATER-MAINS.

Before iron pipes were available for the conveyance of water from distant sources to the houses of cities and towns, recourse was sometimes had to wood for this purpose. In Boston, U.S.A., for instance, wooden pipes were laid down in 1789 to bring water to the city from the Jamaica Pond at Roxbury. A 50-feet length of this pipe was recently dug up when some new high-pressure mains were being laid. The pipes were made from pitch-pine logs with 2-inch and 4-inch holes bored through the middle. Except for the removal of the bark, the outsides of the logs were left in their natural state. Lead pipes with bores of $\frac{3}{8}$ and $\frac{1}{2}$ inch were inserted through cross holes for the house services, the pipes for the latter being connected by lead couplings. These wooden mains had a total length of fifteen miles, and supplied water to 1500 houses. They were discarded in 1840 in favour of 10-inch iron pipes.

MOVING A BUILDING INTACT.

We have long ago become accustomed to the moving of buildings intact in America, but the practice is so uncommon in this country that a recent instance is worth recording. The building in question is situated in Burnside, near Glasgow; it measures 60 feet square, and is two storeys in height. It was moved about 80 feet without interfering with its functions as a store and an office, even the telephones being kept connected during the operation. Built of wood and reinforced concrete, the structure to be moved weighed 150 tons. This load was gradually transferred to a wooden platform resting on iron rollers, which was inserted under the building. This operation complete, the platform was hauled along by means of winches and wire ropes until it rested over the new site, when the platform

was removed. The cost of the removal is said to have been but a third of that which would have been involved in taking down and re-erecting the building.

'CORONA' METAL—A NEW ALLOY.

There seems to be no end to the possible metal alloys having strength, or lightness, or a high resistance to corrosion, or a combination of two or all three of these characteristics. An alloy recently exhibited at Olympia, and named 'Corona' Metal, appears to have additional advantages, being capable, according to the makers, of resisting even the action of chemical fumes which rapidly corrode alloys of copper. In colour the new alloy closely resembles nine-carat gold, and it is said to be practically as ductile and as malleable as gold, while having a tensile strength of twenty tons to the square inch. It can be forged, stamped, rolled, and drawn into wire; and sound, clean, close-grained castings can be made from it.

ANOTHER HOME WASHING-MACHINE.

Owing to the high charges now made by the laundries, washing-machines for the home have become very popular, and those who have used some of the more modern machines will readily admit that they save a vast amount of hard, disagreeable work as compared with the old-fashioned wash-tub. Several of these machines have been described in these notes. In a recent machine the tub is hung on short chains, the result being that when partially rotated backwards and forwards by a handle provided for the purpose it rises towards each end of the stroke. It will be easily understood that very little effort is needed to swing the tub, as the motion closely approaches that of a pendulum. When the tub has been filled with dirty clothes, together with soap and hot water, a perforated wooden disc is placed in position, and held rigidly at the correct height by arms projecting from the framework of the machine. Finally a lid is put over the top of the tub to prevent splashing. As the tub rises at each end of its swing the clothes are squeezed against the disc, and the soap and water pass through the garments with a rapid cleansing effect. At each reversal of the swing the clothes are turned over by a series of struts fixed at the bottom of the tub. Although not an essential feature of the machine, provision is made for a wringer over the tub, fitted with the usual rubber rollers.

A REMARKABLE INSECT.

Few insects have so remarkable an existence as the American 'Seventeen-year Cicada,' a creature which is allied to the European species of the same family. This strange insect lives as a grub underground for seventeen years, and in the winged state for only some four or five weeks. According to *The Times*, in which appears the following description, motion-pictures of it have been taken recently by Mr R. L. Ditmars, of the New York Zoological Society: 'The adult insect is more than an inch in length, has two pairs of transparent wings, brilliant red eyes, and a dark body, mottled with red. Like their congeners, these cicadas have a biting tubular jaw, but it is too feeble to pierce anything except the softest bark, and it is doubtful if they feed during their brief aerial life. The males sing almost unceasingly. The female has a pointed ovipositor, with which she slits the bark of young stems, making holes at intervals, in each of which two eggs are deposited. This is the only damage done by the adult insect; but, as swarms appear in incredible numbers, orchards may be ruined. The best protection is to plant abundant thickets of soft young wood near the orchards the year before the swarm is expected. The eggs hatch in a few weeks, and the young cicadas, minute white creatures without wings, crawl out of the burrows, drop on the ground, and at once begin to bore into it. They have a sharp piercing mouth, with which they penetrate roots and absorb the juices. They tunnel downwards and forwards, throwing the earth behind them with a pair of digging-legs. They live underground for sixteen years, growing slowly, and moulting four times, with little change of shape. At the end of the sixteenth year they begin to tunnel upwards, boring through the hardest soil, making waterproof tunnels through swampy ground, penetrating gravel paths, or finding their way out at the edges of asphalt pavement, and all with such regularity that they appear on the surface at the beginning of May, in the seventeenth year of their existence. They then creep a short distance up a tree-trunk, and halt. Presently the back splits open, and the winged insect emerges as a soft and whitish mass. It creeps feebly an inch or two, and slowly dries. The short flying-life of courtship, singing, and egg-depositing begins, and when it is over all the adults die, leaving their progeny to their long underground life.'

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

*** TO CONTRIBUTORS.

1*st.* All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd.* For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd.* To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th.* Poetical contributions should invariably be accompanied by a stamped and directed envelope.

THE CABIN PASSENGER.

By J. SACKVILLE MARTIN.

PART I.

I.

A FRESH north-easter was blowing, whitening the crests of the waves. The *Silas N. Barnes*, ocean-going brig of two hundred tons register, was rapidly leaving the land behind her. Away on the starboard quarter the Farallones were fading in the distance, and San Francisco was a mere smudge of smoke astern. Captain Keynes and Mr Briggin, the mate, were looking down with disfavour on three men who sprawled, half-conscious, beneath the break of the poop. The captain was a wiry little man with hot blue eyes, and a beard which looked as though it had been fashioned out of fine copper-wire; a little red rat of a man who had bitten his way hard through life, and meant to go on biting it. In his youthful days he had served in various subordinate capacities on a variety of tramps, and had learnt the mysteries of the sea and of sailormen. He summed up his rules of conduct as 'a word (mostly a bad one) and a blow; and if a blow isn't enough, then a kick.' In his youth he had received kicks enough to cow the spirit of a less determined man. But young Keynes was far-seeing and ambitious. He told himself that if he lived hard, worked hard, and got on, he would in time find himself in a position to kick others. This praiseworthy idea dominated his life to such purpose that in due course he found himself in command of the *Silas N. Barnes*, with a reputation for 'hazing' that had earned him the awe and respect of sailing skippers from Lower California to Dawson City and the Arctic Circle. It had not been without practice that he had attained this eminence. He had started early—on his wife, in those days the only person whom he was privileged to kick. Possibly he may have overdone it a bit. Some wives are not sufficiently strongly constituted to afford the practice that a man has a right to expect. At any rate, her health had given way and she had died, leaving him with a daughter. It may have been due to his conscience, or it may have been an appointment as third mate, which had permitted him to exercise his talents on an occasional seaman; but the fact remained that he had never kicked his daughter. She was the apple of his eye. When old enough, she accompanied him to sea. And there were not wanting wondering suspicions in cowed fo'c'sles that if there was any one the skipper was afraid of, it was 'that there gal.'

Mr Briggin, the mate, was tall and dark, with the resigned expression of a pessimistic Mephistopheles. He too had served apprenticeship to the hazing business, although he allowed ruefully enough that he was some way from the mastery displayed by his captain. He had had to put up with a good deal of bad language in his present position, and had at times thought of bettering himself by applying for a separate command. But unfortunately for his worldly prospects, he had within him an incurable vein of sentiment; and the strain was called forth strongly by the captain's daughter. For her sake he would almost have served on the *Silas N. Barnes* as a foremast hand. Certainly he had no intention of giving up the position as mate until the day which he cherished in his mind, but never dared to speak of, when he could take her with him.

The three men who lay asprawl on the deck at the foot of the poop companion were of varying shapes and sizes. One was short and stumpy, one thin and slender, and the third was a man of vast proportions and powerful muscles. One and all of them, however, were alike in the pallid nature of their complexions and a stertorous quality in their breathing which told of mingled drink and 'dope.' Astern, a seaman stood by the wheel. For'ard, other members of the crew lounged by the fo'c'sle hatch, and a couple of Chinamen washed shirts on the deck. Aloft, the wind stretched the sails and hummed in the rigging.

'About time we turned 'em to, sir,' said the mate.

'About time,' agreed Captain Keynes, spitting disgustedly. 'Nice blooming lot they look, too. Not a sailorman among them, or I 'm mistaken. If I 've told Jacob once he ought to be ashamed of himself, I 've told him a dozen times.'

Mr Briggin grinned. 'He knows you 've a way of knocking 'em into shape, sir,' he answered with calculated flattery. 'He knows that if they

 [*All Rights Reserved.*]

ain't sailormen when he dumps 'em on board, it ain't long before they are, when you've got 'em. It's the system that does it.'

'If you call a bit of kicking about a system,' answered the captain morosely, 'you may be right. Anyway, it's the only thing that does with a lot of rotten shore-rats like these. So we'll turn 'em to, Mr Mate.'

He stirred the short man with the toe of his boot. The man grunted. Captain Keynes kicked him hard in the ribs. The sleeper sat up and stared about him with eyes in which the pupils blazed large and dark. He looked first at the deck and then upwards at the rigging. Then he staggered to his feet and groaned.

'Gawd!' he said. 'Done in again!'

'Git for'ard, Chalks,' said the captain, with a truculent allusion to his victim's pallor. 'Git for'ard, and no back-answers!' He emphasised the words with a punch in the man's ribs that sent him staggering backwards along the waist. The man arrested himself by gripping at the bulwarks, steadied himself a moment, and made for the fo'c'sle hatch with a clumsy, stumbling run.

Mr Briggin broke into a guffaw. 'The son of a gun's used to it,' he said. 'He won't give no trouble. He's been shanghaied before.'

'Better not,' retorted the captain viciously. 'I'd like to see the man that'll give trouble aboard this ship. Now let's turn this chap to,' he continued, looking down at the slenderer of the two remaining men. 'Looks a bit of a toff.'

He kicked the man, who groaned and stirred, but made no effort to sit up.

'Stuff's taken a good hold of him,' grunted the captain. 'Here, you!' he went on, addressing his victim. 'You stuck-up, collar-and-cuffs, good-for-nothing land-shark, shake yourself! Shake yourself, and lively now! Take that!—and that!—to help you to do it. You ain't flirting with your little bits of skirt at the Palace or the Waldorf Astoria now—not by a long chalk, you ain't. Up with you, d'ye hear? That's your sort!' as the man rose unsteadily from the deck. 'Now then, git for'ard.'

The youth stared about him. 'Huh!' he grunted in surprise. 'Where am I?'

'Break of the poop!' snapped the captain, 'where you ain't no business to be, sonny. Your place is for'ard. Git!'

'But there's some mistake,' stammered the young man. 'I'm not a sailor.'

'Then I guess we'll have to make you one. Git for'ard.'

'But see here'—— began the man.

Captain Keynes put his system in force. He landed the man a smashing blow on the side of the jaw that sent him to the deck. 'Any more back-answers, you slush?' he said, standing over him savagely. 'Git for'ard, I say! Do you know who I am? Well, I'll tell you. I'm Captain Hazer of Hazetown, I am! I'm Captain Hellfire of Hell! That's who I am. And while you're on my ship you're just an ordinary plain devil, and you'll work like a devil when I tell you. Git for'ard, I say!' he continued, landing the young man a kick. 'Git for'ard, and don't come here soiling my poop, or I'll land you another.—That's about settled him, Mr Mate,' he commented as he watched the unfortunate creature bolt in the direction of the forepart of the ship. 'We sha'n't have any trouble with him. When he's back in Frisco he can go to his millionaire papa if he likes, supposing he's got such a thing. And now for the third beauty!'

II.

'He's some man!' commented the mate, casting an eye on the vast proportions of the remaining sleeper. 'Jacob has done us proud with him. I wonder where he picked him up.'

'Don't matter a cuss!' answered the captain. 'It's me that's got to pick him up now. Here goes for his ribs—and a bit extra, because he's a big un.' He landed a kick in the sleeper's ribs. The man stirred slightly and rolled over on his back.

'Seems to me I've seen his face somewhere,' said the mate, staring hard and knitting his brows; 'somewhere—though where, I can't justly remember. Or, maybe, it's a picture in an "illustrated" he's like, or a "movie." Dash it! I can't think.'

'Don't try,' said the skipper curtly. 'Stir him up—like I do.'

Together they kicked the recumbent man, who groaned and tucked his arms in to his sides.

'Think he's ready, sir?' asked the mate tentatively. 'Jacob said he gave him a bit extra in the dope line because of his size. Better wait a bit.'

'Wait a bit? Not me!' answered the captain. 'It's time he was earning his grub. —Git up, you unexpected son of an unmentionable mother!' he continued, paraphrasing rudely. 'Git up, or I'll kick every rib you've got through your backbone.'

There was no immediate response. Before the captain could repeat the dose, Miss Keynes emerged from the deck-house on the poop and came forward to the rail. To the male eye she was not without attractions. Her eyes were dark and very bright; her hair was abundant and neatly coiled; her figure was trim in its dark-blue reefer-jacket and skirt, and swayed easily to the movements of the brig. Those whose taste in female character runs in the direction of a certain shrinking modesty might have found her wanting. Miss Keynes had not been brought up in a school favourable to the cultivation of such virtues.. She was direct in speech, self-confident, and well able to

look after herself. Her heart had not as yet been touched, and the mate's half-hinted sentiment had so far aroused in her nothing but the feeling of contempt which she considered such 'slosh' justly deserved.

'Hallo, poppa!' she said, daintily descending the companion as she spoke. 'Turning 'em to?'

'You betcher!' answered Captain Keynes judicially. 'Just you watch me stir up this chap!' He kicked again.

'He's a big man, isn't he?' said Miss Keynes, looking down at the vast proportions of the sleeper. 'He ought to be useful. Don't break him.'

Captain Keynes grinned. 'I'm treating him as tenderly as if he was my own son,' he answered, with another kick. 'I can't say fairer than that.'

'Well, I'm glad I'm only your daughter,' answered Miss Keynes, smiling appreciatively. —'What do you think, Mr Briggin?'

'Your father's a man!' answered the mate with gusto. 'And you know it.'

'Of course I do,' replied the girl, squeezing her parent's arm. 'That's what I always say. Poppa's a man. Show me the man that'll stand up to him. When I meet him'——

'Yes?' queried the mate encouragingly.

'Oh, I guess I'd have to marry him.—Wouldn't I, pop?' replied the girl, with a frank laugh.—'It would be too good a chance to miss.' She glanced at the mate with mischief in her dark eyes. 'But I guess he's not aboard this ship,' she continued saucily, 'so I'll stay as I am for the time.—Stir him up again, poppa.'

Mr Briggin looked embarrassed. It appeared to him that he was undergoing a challenge—a most unfair challenge to mutiny; or if not a challenge, then a senseless taunt. He swore under his breath and glanced reprovingly at his tormentor. Fortunately the captain was too preoccupied with his victim to pay much attention to what was going on. He had squatted down by the sleeper's head, and was pressing his thumbs hard over the man's eyebrows. Long ago a broken-down doctor had told him of certain nerves in that vicinity that were exquisitely painful when pressed upon, and he had treasured the knowledge. On the present occasion the treatment proved successful. The sleeper stirred, struggled, and finally got to his feet. He was certainly a magnificent specimen. He stood six feet two inches, and possessed the proportions of a Hercules. His mighty legs were all too vast for the duck breeches which the crimp had afforded him. His open shirt revealed a torso that would have set sculptors raving for marble. He drew a long breath that filled his chest as a balloon swells with hydrogen, and exhaled it again with a roar. His head was bullet-shaped, his ears a trifle thick, his features not amiss except for the nose, which had been twisted, apparently by a blow. Just for a moment he appeared dazed, and his movements were tentative and uncertain.

'Where in snakes'—— he began.

'Git for'ard!' said the captain sharply.

'But say, boss'——

'Git for'ard, do you hear, you swine?' said the captain. His fist shot out to the point of the big man's jaw. Almost any man would have gone down under the blow. But this one was the exception; he took it fairly, and it seemed to clear up his faculties and put new life into his limbs.

'Nearly on the ropes that time,' he said, grinning hard into the captain's infuriated countenance. 'And now take that, you little monkey!'

His fist shot out in its turn, and the captain made two somersaults backwards and landed against the poop ladder. He remained very still.

The mate gave a roar. 'Mutiny!' he cried. 'Mutiny!' He put his hand in his hip-pocket, and withdrew it. A revolver flashed in it. A moment later the weapon was twisted from him and thrown into the sea. An enormous paw gripped him and turned him round, and a huge knee was thrust violently into the small of his back.

'Now, see here, sonny,' said his assailant. 'I'm a peaceful man, and I don't want more trouble than I can help. Where am I?'

'*Silas N. Barnes*—brig—for the Islands!' gasped the mate, addressing the sky, which for the moment he was facing. 'Let go, damn you! You're breaking my back.'

'*Silas N. Barnes!*' answered his assailant without for a moment relaxing his grip. 'And what am I doing aboard the *Silas N. Barnes*—eh, sonny?'

'Killing me!' gasped the mate. 'And I believe you've killed the captain. Let go! Let go, I say!'

'What am I supposed to be here?' asked the man, staring hard at the recumbent figure of the captain, over which Miss Keynes was bending in dismay.

'Ordinary seaman,' answered the half-choked mate. 'And you'll be hanged for this, as sure as I'm alive, when we get back to port.'

'Well, this is a rum go!' said the man coolly. 'Jim Pickett—world's heavy-weight champion—shanghaied on a blooming pork and molasses boat! Now, see here, sonny,' he continued, dragging the mate over to the recumbent figure of the captain and standing him up against the break of the poop, 'you stand there. Stand there, and don't move. If you stir a finger, I'll dot you one; and if I dot you one, you'll see stars! *Stars!*'

Mr Briggin had been known for some years on the western seas as a 'hard case;' but for the moment he deemed it incumbent upon him to adhere strictly to the instructions given. Mr Pickett, after assuring himself that the mate had no intention of moving, looked down at the

captain and at the girl leaning over him. He smiled benevolently.

'Say, missie,' he said, 'I guess they wasn't giving short measure in the looks line when they ladled your share out to you. And you may say I said so.'

'Go away, you great brute!' said Miss Keynes indignantly.—'Mr Mate, why don't you send him for'ard?'

Mr Pickett burst into a vast laugh. 'Why don't he send me for'ard?' he asked. 'I guess *that's* why!' He shook an enormous fist with appreciation.

Before the exasperated mate, who had almost screwed himself up to the point of a further assault, could answer, Captain Keynes sat up, rubbing his head and staring about him. 'Did anything hit me?' he said vaguely, glancing up at the nearest yard as though uncertain that it was still in its place. His eyes travelled on to Mr Pickett. Memory returned to him, but uncertainly, so that he recalled merely the fact that he was dealing with a member of his crew. At once he was on his feet, vicious and indomitable. 'You hulking lout!' he shouted, addressing himself to the astonished Mr Pickett. 'What are you standing aft for, you fresh-water lubber? Git for'ard, you slush! Git for'ard—where you belong! Stir yourself, or, as sure as I'm here, I'll trail you over the stern for shark-bait.'

Mr Briggin gasped.

Mr Pickett rolled his eyes from the angry skipper to the girl. 'This your poppa?' he inquired. 'Fiery little beast, ain't he? Say, missie, you tell him I'm not a sailor. You tell him I'm coming as passenger, this trip—and all for the sake of your pretty face.'

'You'll come as'—— began the amazed captain. 'You'll come as—— I'll tell you what you'll come as if you're not careful. You'll come as salted pork—that's what you'll come as. And you'll go as far as Celebes, or thereabouts, where they ain't too particular what they eat so long as it's meat. Git for'ard now. We don't carry no passengers on this ship.'

He aimed a well-directed kick at the pit of Mr Pickett's stomach. It was his favourite offensive, and had been known to lay men out for days and days. But Mr Pickett was unperturbed. With a swift, prehensile hand he grabbed the captain's foot, turned him about, caught him round the waist, and sitting down on the lower rung of the companion, dragged him across his knee.

'See here, little man,' he said, 'I guess you've too much talk for my liking. When I was a lad, and had too much talk, they spanked it out of me. I'm going to spank it out of you.'

He suited the action to the word, bringing down a mighty paw over and over again on that part of the captain best adapted for the purpose. Mr Briggin stared, apparently paralysed through sheer astonishment. Not so the girl. She attacked Mr Pickett, slapping his face vigorously.

Mr Pickett grinned appreciation. 'You're a nailer!' he said, continuing his chastisement. 'You go on tickling me, my dear, and I'll go on tickling your poppa. He's got to learn manners before I'm through with him, and I'm going to see that he does it.'

Miss Keynes drew back, disconcerted. Her ear caught certain remarks that her father was pouring forth in a spate of wrath. She blushed up to the roots of her hair. Regardless of her embarrassment, Captain Keynes adjured the mate by the memory of his mother to call all hands to his aid.

Mr Briggin awoke from his trance, and ran for'ard. 'All hands on deck!' he shouted. 'All hands! Lay aft here! Lay aft, —— you! and stand by to suppress mutiny.'

III.

Six or seven men came tumbling up the fo'c'sle hatch. The two former victims were amongst them. Of the rest, three were Chinamen. Their astonishment when they beheld their dreaded captain undergoing chastisement of a type more suitable to a ten-year-old boy than to a grown-up man halted them amidships. They stood in a group, gaping.

'Now then,' yelled the mate, 'what are you waiting for? Lay aft here, and rush that man. Put him in irons.'

Between their fear of the mate and uncertainty as to the issue, they advanced slowly a few more paces. Mr Pickett perceived that it was time to act. He rose to his feet, grabbing the captain by the back of the neck and the slack of his trousers. He swung him lightly as one swings a sack.

'Know who I am?' he shouted. 'Any one here seen me in the ring? Any one here seen Jim Pickett when he knocked out the Chicago Dodger in three rounds? Any one like to have a go at me? Then come on—one at a time or all the lot. I ain't particular.'

Lifting the captain above his head, he hurled him at the mate, and the two went rolling over and over in the scuppers. He made a charge forward, and the crew scattered and fled before him to the safety of the fo'c'sle hatch. He turned, and perceived Captain Keynes and Mr Briggin getting to their feet again, and charged them, bellowing like a bull. They did not wait for him, but swarmed up the main shrouds with the activity of monkeys. He turned to the girl and favoured her with a grin of gratified pride.

'Sort of man I am!' he said, slapping his hands together. 'Don't you be afraid of me. I'm quite harmless when I'm not roused. This bit of a scrap has made me thirsty. I'll just nip into the cabin and see if there's a highball to be got.'

He ascended the companion, reached the

deck-house, and paused at the door. He looked upwards at the rigging, and at the captain and the mate, who were looking down at him. 'You 'll come down when I tell you!' he shouted significantly. 'Not before. If I find you on deck when I come out again, you 'll see stars!'

He dived into the cabin. Captain Keynes exploded in further profanity.

'Mr Mate,' he said sharply, 'slip down and turn the keys in the doors—both doors. Look sharp!'

The mate turned an eye upon him of infinite reproach.

'I 'm giving orders, Mr Briggin,' said the captain testily. 'Didn't you hear me?'

'Missie!' called Mr Briggin softly, addressing the girl. 'Just lock the cabin doors, will you?'

Miss Keynes looked up with a trace of contempt. 'I 'm sure I don't mind,' she said, 'if you 're afraid to do it yourself.'

Mr Briggin would have protested his courage but for the uncomfortable likelihood of having to prove it. As it was, he remained silent. Miss Keynes went softly up the companion, locked the port cabin door, slipped round to the starboard side, and locked that door also. Then she looked up. Captain Keynes and the mate descended cautiously.

'Sure you 've locked it?' asked the captain, wiping his forehead.

Miss Keynes nodded.

'If I get home safe to Frisco after this,' said the captain viciously, 'I 'm going to have a talk with Jacob. I 'll larn the little beast to ship prize-fighters aboard of me.'

'That 's all right, sir,' said the mate a trifle sullenly. 'But the question is what we 're going to do with him now we 've got him.'

Captain Keynes scratched his head. 'I guess we 'll have to think,' he said, after a pause. 'He 's safe where he is for the present.'

He put in the whole of the afternoon thinking. The crew had been called up again, and went about their various duties. The brig bowled on merrily, all sail drawing to an eight-knot breeze. But never before had her skipper been so silent; never before had he been so slack in calling the attention of his hands to their numerous shortcomings. Somewhere about one bell in the first dog-watch a certain feeling of emptiness reminded him of fresh complications.

'About time for tea, Mr Mate,' he said sullenly.

'Just what I was thinking myself, sir,' answered Mr Briggin.

There was an uncomfortable pause.

'Well, damn it!' said the captain at last, 'he 's got the tea, and he 's got all the stores, and he 's got the tinned meats and the fresh butter. What in thunder are we to do?'

'There are the crew's stores,' suggested the mate tentatively.

'Cracker hash, by thunder!' snorted the skipper. 'Well, I suppose it 's the best thing we can do.'

He moved forward to the galley for a word with the cook. Before long he and his daughter and the mate were busy in the waist with three tin pannikins containing the unsavoury rations of the fo'c'sle.

Miss Keynes screwed up her pretty nose after each mouthful. 'You 're not going to sit down under this, poppa, are you?' she asked, after a time, putting down her half-filled pannikin.

'You betcher!' answered the skipper venomously. 'We 'll have to hold on until to-night, though. When the swine 's asleep, we 'll unlock the doors and get him before he wakens. He 'll pay for his larks then, or I 'll eat the blessed brig.'

SOME IMPRESSIONS OF AMERICA TO-DAY.

By VIOLET TWEEDALE.

PART I.

I.

AMERICA of to-day is never the America of yesterday. One cannot revisit it and recognise it as the same old place. Its 'Movies' are symbolic of its palpitating, highly concentrated and condensed life. Even its house chairs are on rockers. The resting American is in perpetual motion. His cities are in a continuous state of feverish change.

Life in New York is so appallingly rapid, and lived at such intensely high pressure, that one becomes convinced it must be very short for its inhabitants. Coming from the Old World to the New, one cannot conceive average New Yorkers living to be old. Surely they must wear and tear themselves to frazzles by middle age. Is this why one so rarely sees an old person in street or office?

I saw an old woman of perhaps eighty years walk slowly through the lounge of America's largest hotel. The apparition startled me, as I suddenly realised she was the first really old person I had seen since landing. Every one stared at her. She was a novelty. Where does America hide her old people? No one seems to know. Perhaps there are none. White hair is to be seen everywhere—on the heads of shop and office girls and young men; but white hair in America has no connection with old age, and hair-dye is practically unknown.

On the voyage out sixty years appeared to be the limit, and those who boasted this age were but a handful. The three thousand odd souls who packed the liner were just a cheery mob of cosmopolitan youth of intense energy and above the average good looks. There happened to be few British born. A number of Americans in deep mourning were returning home from the European battlefields, where they had searched, as a rule vainly, for the graves of their dead.

There are many people who start out on a voyage with one strong desire—to sit at a 'nice' table in the dining-saloon. The 'nicer' it is socially, the better.

The wild scrimmage to share seats with the mighty begins the moment the liner has pulled away from the shore. I leave my seat to chance. I am not concerned with the mighty, but with human interest everywhere, that will reveal to me something I may have missed in life.

My table was eventually made up by an intelligent Scottish girl, a young British officer, my secretary, and two American men whom I at once named the 'Moon Child' and the 'Live Wire.' By those names they were known and addressed throughout the voyage. They immediately adopted nicknames for each other. The Moon Child was 'Jack Johnson.' The Live Wire was 'Sherlock the Jew.' I pointed out that Shylock was the correct pronunciation, but the suggestion was never accepted.

After the first meal or two, when we had thawed out the young officer, we were the cheeriest table in the saloon.

'Be pleasant to every one' is a golden rule to be observed on a voyage. It makes a mighty difference to your fellow-passengers, and it even helps that great potentate, the captain of the ship.

Though the antithesis of each other, the Moon Child and the Live Wire were pure American types. The former was a big, burly young man of bulldog breed, a rough diamond from Texas, and a born mystic. He was very homesick, and often seasick, and when he was feeling abject I used to sit down beside him and talk of his children. That made him well again, and the snapshots were brought out of his pockets, and we sat absorbed in the most absurd trivialities connected with 'the twins' and the coloured nurse-girl. He assured me he had never told a lie, and to illustrate the superiority of truth over fiction he gave me the following anecdote.

Once he was carrying six bottles of beer through a very rough Texas street, and every man he met stopped and inquired, 'What have you got there?' 'Beer,' promptly replied the Moon Child. The inquirers all smiled knowingly and passed on. No one believed the truth, and the beer came safely home.

Only once did the Moon Child fail me at eight o'clock breakfast during the nine days' voyage. He confessed at once that he had fallen, and had accepted sherry from a fellow-passenger.

II.

The Live Wire was a totally different type—a shrewd, hard-headed New York financier, and quite incorruptibly dry. He also was homesick for Wall Street and his little dog, and there was no side-stream in European politics which he had not navigated. We had many deeply interesting discussions on the financial and economic conditions of our respective countries, but by common consent we conversed apart, simply because so many of our British-born or naturalised subjects dislike facing the truth temperately. My experience was, they either denied the facts or walked away in a rage. This common attitude is a great mistake, as it gives the impression of ignorance. The Britisher who visits the States ought to acquaint himself before sailing with the present financial situation. It is the common property of all Americans, but unfortunately known to few here. It will save him from many painful shocks and much irritation if he remembers the truth, that we owe America one thousand and forty-seven millions sterling (see White Paper for July 1920), not allowing for the adverse exchange. He will be forearmed to meet a subject which constantly crops up as a matter of course in serious conversation.

The average Englishman's ignorance of the financial situation I found to be a common cause of friction between the two nations. How much more dignified it would be, in place of angry denial, to face truth with friendly acknowledgment!

Another foolish point of friction I often heard discussed was America's late entry into the war. An American is hurt when taunted with this. His explanations of the immense racial difficulties he had to overcome and reconcile before he could come in were generally received with ignorant incredulity. Tell an American that he had to come in to save his own skin, and he is wounded to the quick.

Despite his repudiation of President Wilson and all his works, he firmly believes the Wilsonian statement that young America went forth to war imbued with the spirit of the Crusader, to fight for a high ideal. The plain and quite obvious truth is that Uncle Sam considers Europe terribly ungrateful to him. His patience is great, but there are times when he is driven to remind John Bull that Britain implored him to come in. He asks not for thanks, but for simple acknowledgment. He is apt to inquire how France and Britain would have acted had they been called upon to cross three thousand miles of ocean to help America to conquer a terrible foe that threatened her very existence.

That question I never feel capable of answering, but unhesitatingly I say that the dignified and generous attitude which is worthy of Great Britain would be a frank recognition of all

America did for us in our terrible ordeal. Do not let us forget her financial help, for which we are not yet paying any interest, and without which we could not have continued the struggle, even if some of us are apt to minimise the military assistance which poured in to the tune of millions from across the ocean.

Another fact we must realise is that cultured America is intensely proud of going dry. I never met one American who was against total prohibition, but I wish to emphasise the fact that I mixed only with the business community, and did not enter at all into what is termed society. Truly, going dry is an amazing achievement to study on the spot. Picture the Ritz Hotel in London or Paris at 8 P.M. on any night—the crowds, the beautiful clothes and jewels, the music, the choice viands, the many little dinner-parties going on—and nothing but water to drink on the table. Because of this lack of alcoholic beverages is the same brilliant scene enacted in New York lacking in conviviality? Assuredly not. As the great silver jugs are carried round, and the clear iced water is poured into crystal goblets, one marvels why, when the good God has given us Adam's wine free, we should spend money on intoxicants.

Turn to another side of American life, and watch gangs of brawny men labouring in grilling heat at excavation-work. A huge machine, operated by half-a-dozen men, drives four gigantic iron fingers into the face of the earth. The fingers tear away earth, stones, and rubble, and fling them into a great receptacle below. When it is full a lever is turned, the receptacle swings round, and hangs above a motor-driven wagon. The bottom of the receptacle falls out on hinges; the contents drop into the wagon. Other men are drilling into the ground, pumping the subsoil dry. The noise is terrific, the heat grilling, sweat pours from the grimy faces, the activity is continuous, but in a corner is a stall with iced water, and the men move to it constantly and take long draughts.

In the train, where there is no class but one universal class, you can go to the end of the Pullman car and put a penny in a slot. Out falls a white paper cup. Turn a tap and out gushes pure iced water. In the bathroom which adjoins every bedroom in the hotel you will find three taps—hot, cold, and iced water. As one moves about Dry America a profound respect for so mighty an achievement takes possession of the mind, and one realises the plain truth that it takes a very great nation to go dry. You may be for or against prohibition, but the fact remains that America has won a stupendous victory which will have its repercussion all over the globe. One comes swiftly to resent the oft-repeated statement that the British workman cannot do without his beer or spirits. Do we really believe that our men are incapable of doing what others in a far more trying climate have accomplished? One must visit America to realise what temperance can accomplish for a wonderful nation.

III.

When I first visited New York the Custom House was an expensive terror. Now it is a joke that costs nothing. Tips are abolished. If you tell the simple truth you will have no trouble. It is permissible to take in, free of duty, fifty cigars and three hundred cigarettes. No one who knows the America of to-day will want to smuggle in clothes. I found American clothes much cheaper than European clothes, and beautiful at that. For ten dollars you could buy the best sports-coats in infinite variety. For twenty-eight dollars you could become possessed of an exceedingly smart frock. When you had bought the hat to go with it, you had expended twelve shillings and sixpence more. Fruit and vegetables are very abundant and cheap. An American banana, price twopence, has little resemblance to our bananas. It is twice the size, and of very delicious flavour. I am told the sea-voyage robs it of this distinctive taste.

The prices in the good hotels are similar to those of England, but the food is much superior, and being so abundant, it is badly wasted. The waiters always help one to far more butter and rolls than one can eat at a meal where there are many other dainties. The portions served are too large for any one person to consume. In a New York hotel no one knows whether you take your meals in or out, and if you desire to live well, and yet economise, let me recommend 'Childs.'

'Childs' richly deserves mentioning. So far as my experience goes, these popular American restaurants are superior to similar establishments in London. There is a 'Childs' in all the main streets of the great cities, and they are conspicuous for their spotless purity. Floors, walls, ceilings are tiled in white, and the tables are covered by a white substance I took to be celluloid. It holds no stains as marble does, and retains its spotless whiteness. Male and female employees are dressed from head to foot in white, and change into clean clothes every three days. The food is half the price of that in the hotels, and first-class. All visitors to America should remember 'Childs.'

When you first enter a great American hotel, you will be arrested by the intolerable temperature. I took the temperature in the lounge of the Hotel Pennsylvania several times, and never found it below eighty-five. The outside temperature was only seventy-five. This heat makes business very trying to the British, as all offices and shops are similarly hot. The explanation is that owing to the noise of the street traffic all doors and windows must be kept closed, and the winter artificial-heating does not escape. It is wise to ask for the highest bedroom to be got. On the fourteenth floor of the

hotel the window of my room had to be closed before conversation was possible; but one can get fresh air at that altitude, and the view, especially at night, is wonderful. In spite of the overheated atmosphere, the American woman always wears her furs inside the hotels during summer. I have come to the conclusion that she is a very hardy flower. She is flower-like to look upon, with her exquisite daintiness, and her tiny little hands and feet. I did not find it true that American women spend their days in shopping, eating candy, and listening to lectures, whilst the men are toiling to death in the city. The men toil no harder than in other cities, but they make much more noise about it. Women run all the Government offices, and sit in all the responsible seats in the great hotels. In the latter places they work in shifts. No hotels or big restaurants ever close at night. Trams run all night, and taxis are as numerous between 3 and 4 A.M. as they are between 3 and 4 P.M.

I looked out of my window at all hours of the night and early morning, and could see no great diminution in the traffic at any time.

IV.

I sometimes sat down for half-an-hour beside the girl in one of the information-bureaux of 'the largest hotel in the world.' She had her seat, her table, and her 'phone in the hall close to one of the many doors, and her shift was from 4 P.M. to midnight. A never-ending stream of inquirers came to her, and she never hesitated a second in her replies. She was a 'Cook' and a 'Bradshaw' in one, and she never stopped smiling. There she sat with her flower-like head beautifully dressed, her tiny white hands perfectly manicured, reeling off her replies. It was all one to her whether you inquired the direct route to Mespot, the fastest train to Palm Beach, or the nearest shop for buying white elephants. She sent you right there with written directions and her sweetest smile. One afternoon whilst I sat by her I counted thirty-six replies she gave as to departing trains, and I never saw her consult a time-table. It is well to remember that any station in America will present you with a time-table for nothing. In England a 'Bradshaw' costs two shillings.

This wonderful girl, typical of thousands in the States, confided to me that she did not expect to live long. She answered questions all night whilst she slept. She got a fortnight's holiday a year, and no Sundays. In another part of the hotel sat rows of women with 'phones clamped to their heads, attending to a continuous stream of people who came to consult them. They lived in a maze of numbers for eight hours at a stretch—an amazing exhibition of endurance in such an atmosphere.

The American woman does not 'make up,' and I saw no beauty-shops. It is the rarest thing to see powder on a woman's face, and rouge seems unknown except to those who are constantly visiting Europe. Leaving the complexion to nature is common to all classes. The only powder I saw was on the faces of a few coloured women. The effect may easily be imagined. This absence of 'make up' is very striking to the traveller coming straight from England, where rouge and powder are so prevalent. Other first impressions are the vast crowds, the very defective and badly kept roads, which jolt one horribly, and the total absence of dogs. During a fortnight I saw two dogs in New York, being led late at night in a by-street. No dog could exist in the day-time in the main streets. It would be trodden to death very speedily.

By night New York is a blaze of light owing to the extravagant use of electricity in advertising. This is a comparatively new development in American life, and its cost must be a negligible quantity, as even tiny shops have elaborate electric devices above their doors, and no one bothers to switch off the lights by day. In every hotel bedroom I was shown into all the lights were on. Eclipsed by brilliant sunshine, they added considerably to the temperature.

It is not always easy to guess what the great advertisements pictured by electricity are intended to advertise. For instance, every night a huge cat played in the sky. It chased a mouse, and its paw was constantly darting out to catch its prey, and its tail switched violently. In another part of the sky hung something more comprehensible—a gigantic motor-car, which flashed red, white, blue, yellow by turns. The enormously tall buildings appear to have no window-blinds, and every room is lit up. Undoubtedly New York is a wonderful city to look upon when night has fallen.

The traffic congestion is very unpleasant, and the crossings are dangerous; but in such great arteries as Fifth Avenue traffic is regulated all the time, as our railways are controlled at night, by signal-boxes placed in the middle of the road. In those boxes stand two men using red and green lights. Police in the street beneath see that the signals are obeyed.

'The largest hotel in the world,' the 'Pennsylvania,' prides itself on supplying from within its walls everything that man or woman can possibly need. If you lose your luggage and prefer a new outfit rather than go to bed, the management guarantees to 'fix you up' in half-an-hour, at any time of day or night. It must be remembered that the hotel is going as strong at 3 A.M. as at 3 P.M.

In your bedroom your 'phone is the great adjunct. You don't see a chambermaid (they come on in shifts) unless you specially desire to do so. I had been in the 'Pennsylvania' a week before I met one of mine; and, strange to say, they don't seem to expect tips, as they are hard to find when one leaves. Even when found,

the young lady is probably a shift you have never met before. In the corridor they wheel about a tiered contrivance with their tools, and a receptacle for waste-paper at one end. They will sell you, there and then, any toilet necessity you may happen to require. Your bed is not made till night. The American habit is to air the beds all day. If you require 'maiding,' you tell the lady of the bureau of your floor, and she supplies you with an attendant for elaborate or plain dressing, according to your requirements; but your bedroom and the bathroom attached are elaborately supplied with self-helps. If you want your shoes brushed, and your skirt or your trousers brushed and pressed, you 'phone to say so. You then place the articles in a cupboard attached to the room door, which is termed 'The Servitor.' It can be opened by the valet in the corridor. In a short time a tiny bell rings, and without opening the room door you open your 'Servitor,' and find that your order has been executed.

When you awake, let us say at 7 A.M., your eye at once falls upon a newspaper lying on the floor by the door. You pick it up, and find it to be the morning issue of the *New York Times*. Attached to it is a coloured slip of paper, upon which is printed: 'Good-morning; we trust you have slept well. Kindly accept to-day's paper.'

THE MOUNTAINOUS MR NEUBURG.

By W. DOUGLAS NEWTON, Author of *War, The North Afire, The Undying Story, Phillip in Particular, The War Cache, Green Ladies, Westward with the Prince of Wales*, &c.

CHAPTER II.—*continued.*

II.

THE gang had scored the first trick, but it was not altogether a signal advantage. It put Clement on his mettle. First, it enabled him to appreciate exactly the type of rogues he was dealing with. There was going to be nothing timid about their methods. They were bold, and they were clever; they were going to take hold of every advantage and push it home ruthlessly. Clement did not mind that at all. He could be bold and ruthless, too, and because of his seemingly casual manner, his boldness and his ruthlessness could be carried off in a way which would baffle them.

In fact, no later than that afternoon, Clement, with an apparently thoughtless inconsequence, began to baffle them. He played for the second trick—and won it.

It was obvious that from the first the gang meant to block him out from Heloise's side; they were going to hedge her about, prevent even the dawning of an intimacy with him. Clement smiled as he saw the little comedy being played. The Gorgon clung to the girl tenaciously. And to double the guard, so to speak, the large, fat rogue was called in.

They were clever. They played with infinite skill. The mountain of a man was drawn in with brilliant casualness. Heloise and the Gorgon looked at Ireland over the taffrail. They talked about Ireland. They speculated about Ireland. The Gorgon made a conspicuous mistake about an Irish headland—and there was the large, fat man putting her right, standing already one of that little group, pouring out attractive facts about Ireland with a pleasant, well-informed politeness.

It was one of those swift ship-board acquaintances. The fat man, the apparent stranger, had skilfully inserted himself into the duologue between the Gorgon and Heloise, and the Gorgon had, as skilfully, drawn him into the circle. Clement, who had been hovering in the background, saw what it meant. One of them, now, would always be at the girl's side, effectually putting a stop to any particular and personal approach of his own. The three watched Ireland until they had had enough of it. Then they walked the deck a little. Then the two ladies sat down, and the fat man, with invincible politeness, walked away. Clement exchanged a few words with the two women in their deck-chairs; pleasant words, but of no effect. The Gorgon showed no signs of moving; Heloise was too polite to move away from the Gorgon.

The lunch-bugle went, and they were parted. After lunch the Gorgon and Heloise were inseparable. They sat on deck-chairs again. Tea came. Clement found that the Gorgon had whisked the girl into an alcove in the lounge. He was about to join them boldly, when the big, fat man materialised with his unexpected swiftness, crossed the lounge, and planted himself in the only other seat available. Clement smiled, and sat and had his own tea, and waited. He watched the trio. Presently his chance came. The fat man and the Gorgon suddenly involved themselves in one of those conversations in which the third person plays the part of a listener only. As the two talked, as Heloise listened, Clement crossed to them swiftly and quietly—and snapped the girl from under their very noses.

It was quite simple. It was one of those simple acts that baffle the clever. Clement slipped round behind the discussion, as it were, and said to the girl, 'Coming for a stroll, Miss Reys?'

And Heloise came—came alone. There was nothing for the others to do. To break off their discussion to fence with this pleasant young man would have looked strange. To come out with the girl was certainly impossible, for they had not been invited. They had to remain, ostensibly unconcerned, if they were not to draw attention to themselves and their actions.

And in his casual way Clement clinched his victory, *did* draw attention to any future 'blockading' action the precious pair might attempt.

He took Heloise up to the boat-deck, that encumbered deck upon which strolling is an impossibility. He found chairs, and placed them in a spot that could only accommodate two, and was also quite neatly screened from casual view. As they sank into it he sighed, 'Oh, well, this is very much better.'

'It isn't strolling, anyhow,' laughed Heloise.

'Oh, I didn't want to stroll; I just wanted to be selfish,' smiled Clement. 'I wanted you to myself. There seem to have been millions of people about you ever since we came aboard.'

'Scarcely millions,' she smiled back. 'Only my companion and that rather stout, quite pleasant man.'

'Only those,' said Clement, underlining the personality and the actions of the pair deliberately; 'but they do seem to be rather clinging. Always there appears to be a great crowd barring the way.'

'Always,' she laughed. 'But we've been on board only half-a-day.'

'Perhaps I was looking forward,' said Clement, ingeniously emphasising his point. 'I saw it happening every day, every hour of the day, for the rest of the voyage.'

'You're unnecessarily gloomy,' laughed the girl, not altogether displeased at the interest this good-looking young man took in her. 'It won't happen every hour every day.'

And Clement, with an inward chuckle, thought it wouldn't. He left it at that. He had, he knew, won that trick. Not merely would he have *tête-à-tête* talks with Heloise in future, but he had so emphasised the attitude of the pair of rogues that their attempts to shut him out from Heloise must only engender suspicion in her mind.

After a moment's silence Heloise said, 'You're rather hard on Mr Neuburg. He's a very pleasant person, and quite well-informed about Canada.'

'I'm quite well-informed about Canada myself,' said Clement.'

'About shooting—sport,' she teased him.

'That—and other things,' Clement laughed back. 'I know appearances are against me, but, really, I'm rather well up in other things—industrial things, for instance.'

It was a casual remark delivered with an inconsequence that covered up the deliberate meaning Clement had put into it. And it struck home, as Clement had intended.

'Really!' she cried. 'Industrial things—you know something about Canadian industries?' She was eager at once.

'Quite a lot,' said Clement. 'You see, even if I didn't happen to be keen—which I am—I'd have to take a personal interest. I've money invested in quite a number of Canadian concerns—agricultural machinery, fruit-farms, grain areas, mines'——

'Mines!' breathed the girl. 'Do you know something about mines?'

Under his casual easiness Clement Seadon thrilled. He had suspected from the beginning that the venture in which Henry Gunning was supposed to need backing must be mines; the district in which he lived pointed to that. But here was confirmation of that suspicion. He had touched the matter which was the foundation of the plot at his first attempt to find out. And he had also obviously done more. He had made the girl feel that he was a sympathetic and knowledgeable person to whom it would be easy to talk about mines and the prospects of mining. And, in fact, he *was* just that person. He was sympathetic towards her—as she leaned towards him, slim and vital in her beauty, he knew it was astonishingly easy to be sympathetic—and he did know a good deal about mines, too. He said so.

'I know, I think, a very fair amount about mines. Oh, not merely on the investing, the money-getting, side, but on the practical side too. I once went out for three months with a prospecting-party—not as a fortune-hunter, but as one who wanted to learn. It's rather a fad of mine to get to know things, to learn how things are done from the bottom up. As some of our money was invested in mines, it seemed to me that I should have a working knowledge of the whole proposition. So I went out with the party, and got a good practical grip of that side to support my knowledge of the financial side.'

'And you did your prospecting—where?' she asked, a little breathlessly.

'Oh—in Canada,' he said. And then he paused. Should he risk being specific? Would it frighten her to hear the name of the very place where Henry Gunning, her old lover, was living; and would that put her on her guard against him—as she had been on her guard against the questions of the little lawyer? Or would it, on the other hand, draw out confidences? He rather felt it might. He was, so far as she knew, quite outside her concerns, and she might want to learn things, just as he wanted to learn everything as early as possible in order to know how to act. And then, as he hesitated, she said with extraordinary eagerness, 'In Canada! But what part of Canada?'

Her eagerness decided Clement. 'In British Columbia,' he answered, as a man mentioning something of no purpose. 'To be exact, in the mountain-valleys in the south of B.C.

There's a whole string of valleys there with rather beautiful lakes in 'em. We started at Nelson, on Okanagan Lake, and worked up northward. They mostly grow apples and peaches there, but there was a good deal of mineral about, we'd heard. Anyhow—I say, I hope I'm not boring you—anyhow, we pushed slowly up those valleys to a little one-horse place called Sicamous'——

'Sicamous!' she cried, her eyes very bright, her cheeks exquisitely flushed, and for a moment Clement wondered if he had done right to mention that name. 'Sicamous! But that's real luck—for me, I mean. I actually want to learn something first-hand about Sicamous—and about the mining in those districts.'

With a throb of excitement and satisfaction, Clement, looking exactly like an Englishman who was no more interested than he should be when a pretty woman gave him her confidences, leaned forward to hear the next important words. And——

'Oh, Loise. . . . Forgive me, Miss Heloise. . . . Where did you put the aspirin tablets? . . . I have a terrible headache. . . . I went to the cabin, and could not find them. . . . And I've looked for you everywhere.'

Before them stood the Gorgon smiling apologetically, wearily, but at the same time determinedly. She had arrived just at the right moment to interrupt revelations.

(*Continued on page 83.*)

AFFORESTATION.

By the Rev. JOHN TAYLOR, B.D.

AFFORESTATION is a subject that has been very much before the British public in recent years. Even before the war it was felt that far more timber should be produced in this country than was being done. The proportion of land under trees in Britain was much smaller than in other countries. In Germany the acreage was 26 per cent.; in Austria, 33; in Belgium, 17; whilst in England it was only 5, and in Scotland a little over 4.

Since the war the need for afforestation has become still more crying. During the war between four hundred thousand and five hundred thousand acres of forest in this country were cut down. In other words, about half the forest-land of Britain has been depleted of trees.

Let us first consider the indirect advantages of afforestation. Forests increase the beauty of the landscape. Tulliallan Forest was one of the largest and best-grown forests in the Lowlands of Scotland. In the autumn the tints of the fading leaves were wonderfully beautiful. In the spring the various greens of the foliage were lovely beyond expression. Even in the winter, when the boles of the trees and the branches were splashed with snow, the trees were things of beauty. Of that forest the greater part of the trees were cut down during the war. What was formerly occupied by woods is now a bare moor. And what a change for the worse has taken place in the aspect of the landscape!

Another indirect advantage of woods is that they provide shelter to crops and cattle from cold and destructive winds. A well-grown belt of wood, sufficiently broad, affords far better shelter from injurious winds than a stone wall does. It is well known that many high-lying exposed fields would go out of cultivation but for the protection afforded by woods. Even in the case of low-lying ground shelter-woods are sometimes necessary. On the shores of the Moray Firth the wind sometimes blows in from the open sea with great violence. The soil is very sandy, and in the case of fields not protected by shelter-belts, the soil, consisting as it does almost entirely of sand, is blown away, and is frequently found after a storm in wreaths on the roads.

Forests, again, cause the water precipitated as rain to flow away more slowly. In this way they help to reduce violent and destructive floods. In the Alps, the Tyrol, and the Pyrenees many of the woods in the higher parts of the mountains have been burnt down by goat-herds and others. The result of this wanton destruction is that many of these high-lying parts are now subject to floods and avalanches, where such disasters were unknown in the past, and millions of pounds are being expended in reafforesting these high grounds that have been depleted of trees. And in Scotland we have in many places disastrous floods which could be prevented by the high-lying grounds of the catchment area being afforested.

A further indirect gain from woods is that the trees by means of their roots bind the soil together. They prevent the soil and other materials from being washed down from hillsides and deposited on the fertile valley-lands forming the banks of the river lower down. A double injury is thus prevented—namely, the denuding of the hillsides and rendering them unproductive; and, in the second place, the covering of the low-lying fertile ground with gravel and stones, and so making it unfit to produce crops. Even when the soil consists of sand pure and simple, the roots of trees bind it together and prevent it from being blown about. In the department of the Landes, in south-west France, there is a strip of sand-dunes from one hundred to three hundred feet in height, and four miles in breadth, lying along the shore of the Bay of Biscay, and extending to two hundred and twenty-five thousand acres.

These dunes were being blown by the prevailing west wind towards the east, and were burying cultivated land and even houses, when, at the end of the eighteenth century, Nicolas Thomas Brémontier devised the plan of arresting the scourge by planting the dunes with maritime pines. Two hundred and ten thousand acres have been thus treated. And not only has the destructive easterly movement of the sand been arrested, but these coast-lands, which were formerly a desert, are now producing valuable timber, turpentine, and resin. In Scotland the Culbin Sands, at the mouth of the Findhorn, have been similarly treated, but there the trees planted have been Scotch fir and Austrian pine. These sands, which were formerly an unproductive desert, are now a remunerative forest. During the war a considerable part of the woods was cut down, supplying us with valuable timber, which was then sorely needed by the nation.

Forests increase the healthfulness of a district. In them there is very little dust; and it is well known that dust is deleterious to health. Another effect of forests is that they reduce the extremes of heat and cold, and make the climate more temperate, and so more healthful. Again, the sweet odours emitted by pine-trees are not only grateful to the senses, they are also health-giving; and so we find sanatoria frequently placed beside pine-forests.

Forests give increased employment to people in the country. A thousand acres of rough grazing under sheep would give employment to one shepherd and one gamekeeper. Under trees a thousand acres would require ten foresters and two gamekeepers. And this is not all. The busy time on farms is the slack time in forests. The foresters and the gamekeepers would thus be available to help the farmers in the hay, the corn, and the potato harvests, when they often have great difficulty in getting people to help them. For obvious reasons it is of the greatest importance to keep as many people as possible in the country.

The direct utility of forests is chiefly due to their produce. Their principal product is timber. Year by year we are using more timber and importing more from abroad. We are doing this notwithstanding the fact that we have practically ceased to build our ships of wood. We use wood for railway-sleepers, telegraph-poles, pit-props, house-furnishings. Perhaps the main reason why we use so much more timber now than formerly is that we require a very large amount for wood-pulp for paper-making. Two million tons of timber are required to produce the wood-pulp used in Britain annually. Think of the enormous quantity of paper used for newspapers, for books, for wrapping up parcels, for letters. Beautiful fibres closely resembling silk are now made out of spruce timber. This vegetable silk, as it is called, is woven into scarfs, &c., and is sold in our drapers' shops. It fetches a very high price. In 1908 five thousand tons a year of this fabric were being produced in Europe, and this quantity bade fair to be very much increased. Other direct forest products are turpentine, resin, and materials for tanning.

We thus see that for various reasons it is of great importance that the acreage under forest trees should be much increased. Suppose that a landlord has some ground which he is inclined to think should be planted with timber trees. His first step is to find out whether it is suitable for afforestation. If he discovers that it is suitable, his next step is to find out what tree or trees it is most suitable for. If the ground be very wet, alder will probably be the best tree to plant. If it be high-lying, birch and Scotch fir will probably be the right trees. Spruce and larch must never be planted together. If they are so planted, an insect gives rise, in most cases, to galls on the spruce. From these galls emerge insects which alight on the larches and produce a numerous progeny, which suck the leaves of the larches, lower the vitality of the trees, and eventually kill them outright. It is not easy to fix on the right tree to plant, and a mistake in this matter often foredooms the forest to failure. The best plan is to apply to the Forestry Commission recently appointed by Parliament, and they will send out an expert free of expense to advise on this important point.

The next step to be taken is to make an estimate of the cost of preparing the ground and planting it. If the area to be planted with trees has been occupied by trees previously, all the branches and débris of the trees cut down will have to be removed. This is usually done by burning. The bark of the stumps left in the ground will have to be removed to a depth of six inches below the surface of the soil. This is done to do away with the pine-weevils. The rabbits must also be got rid of. To prevent their return a fence of wire-netting must be put up round the area to be afforested. Ditches, drains, and roads require to be put to rights. The next thing to be done is to plant in the prepared area seedling-trees, usually three years old. Owing to the present high price of labour, materials, and plants, reafforestation involves considerable outlay. And as a forest of Scotch firs, spruces, and larches, the trees commonly planted at present, normally takes seventy years to come to maturity, the landowner who plants can hardly expect to be the one who will reap. Moreover, when the great expense incurred and the compound interest on the money laid out are taken into account, some landowners are of opinion that the money that will be obtained for the trees seventy years hence will not prove an adequate return for the outlay. One objection to this view is that nobody knows what the price of timber will be in seventy years;

but the chances are that it will be greater than it is now. Another thing to be taken into account is that many landed proprietors have cut down a large part of their woods during the war, and have got record prices for the timber sold. As in most cases they did not plant the trees cut down, it is only right that they should replant the areas depleted of trees. If the replanting is unusually expensive, the prices for the timber sold during the war were unusually high. But if the owner feels that he has not money that he can lie out of for such a lengthy period, he should apply to the Forestry Commission, and they will inquire into the case. If they are satisfied that the forest is being conducted on sound principles, they will give him a loan of money on easy terms, to be repaid when the mature forest is cut down and the timber sold. If the landowner objects to this arrangement, the Forestry Commission may take a lease of the ground, afforest it themselves, and pay an annual rent for it.

Another way of reafforesting an area is what is called 'natural regeneration.' The steps in this method are as follows. At the time the wood is cut down a number of trees in fruit, called 'mother-trees,' are left standing all over the ground. Sheep are put on the ground thus partly cleared to eat down the heather and the blaeberries (*Vaccinium Myrtillus*), and so enable the seed falling from the mother-trees to reach the soil. After a time numerous seedlings spring up. Indeed, so numerous are they that they have to be thinned. One remarkable thing is that rabbits do not so readily attack them as they do seedlings that have been transplanted. The great objection to 'natural regeneration' is that it frequently takes a considerable time to complete. The time is sometimes as much as fifteen years. Its advantage is that it is much cheaper.

THE FLOTSAM OF FATE.

By H. MORTIMER BATTEN, Author of *Habits and Characters of British Wild Animals, Tracks and Tracking.*

I.

THE old man sat by the garden gate in the pale evening sunshine, and watched the scene at the open mistal door with amused understanding. A family of little mongrel puppies besported themselves there in the light; while their mother, the mongrelest mixture of all mongrels—for she was a pukka sheep-dog—basked under the wall, and watched her children with proud solicitude. But the object of the old man's amusement was the father of the brood—a gaunt, smooth-coated sheep-dog with big ears and bright yellow eyes, a dog as much like a dingo as any dog but a dingo could be.

Dingo did not know he was being observed, and so he had dropped his habitual reserve towards the puppies. One of them had him by the ear, and a second was striving manfully to drag his forelegs from under him. The old dog was giving himself up to their gambols, a martyr to the cause, enduring it all with bored amusement, while now and then he paused to fondle and caress one of the woolly mites.

The little family scene was brought to a close by the opening of the door across the yard, and a young man came out of the house. Instantly Dingo's attitude changed. Ashamed of his condescension, he began to strut away, stiff-legged and full of dignity; and when one of the balls of wool ambled after him on clumsy puppy legs, he turned with a growl and harmlessly rolled it over. The puppy returned to its mother, and, secure between her forelegs, growled its puny vengeance in awful puppy thunder.

The old man laughed. 'Dingo thinks a lot of them wee mites when there isn't any one looking, Ben,' he observed.

The young man seated himself at his father's side. To him the little scene had meant nothing. A good shepherd and a hard soldier he may have been, but he did not understand dogs. He regarded them much as he regarded horses—as useful just in so far as their capacity for work extended, and of no further interest. Ben Inglis was known by the shepherds of the hills to possess no heart where animals were concerned, and no one liked him the better for it.

'Good dogs, too, they ought to make,' the old man rambled on. 'Dingo springs from the best stock in the hills. He comes from an older shepherding family than you and me, Ben. And Nell—well, I reckon we could get twenty pounds for her any day we chose. I call to mind'——

'Better get it, then,' the young man answered briefly. 'I reckon nothing of her kind on these big moors—too short in the leg to get over the heather.'

Dingo ambled up and looked into the old man's eyes. He did not look at Ben. Since the young man's return to civil life he had done little to win the favour of his dogs. The old man moved uneasily. He loved all dumb creatures in his slow and muddle-headed way. 'Sell her!' he cried defensively. 'Sell our Nell!'

But just then the woman of the house appeared, and chided the old fellow for sitting without his hat. She said he would catch his

death of cold—which was exactly what he did do. It was his third cold that spring, and he was very old. Next day the doctor came, and went away looking grave.

Three nights later Ben was wakened by Nell and Dingo howling in unison across at the mistal. For some minutes he who had seen death in a thousand ugly forms was afraid to rise, but at length he did so. The old man was dead.

II.

The shepherds came from far and near to the funeral, as shepherds do. They looked neither so happy nor so picturesque in their mourning-garb as in their workaday clothes. Ben, with an eye to the material conditions of life, did not omit to mention that he had a promising litter of puppies to dispose of. So, when the sorrowful work of the day was ended, several prospective puppy-purchasers followed in Ben's wake to the granary, where, on a fusty sack in the corner, Nell nursed her brood.

She snarled when the strangers approached, and forbade them to touch her treasures; but Ben cuffed her with his cap, and one by one fished out the squirming balls for inspection. None of the men was much impressed, for, though to Nell the loveliest things on earth, they were very ordinary puppies. The scene was one of merriment and laughter, and to the sheep-dog that was the sore point. They had handled her puppies roughly, and—*they had laughed at them!* Yes, they had laughed at Nell's puppies!

Who can read the heart of the sheep-dog? All day Dingo and Nell had idled forlornly about the farm. They had hated the strangers, and the whole atmosphere of extraordinary events. They did not contemplate the future, but the present was all significant. They had looked from face to face, searching for one they felt they would not find. They knew that the man whom they had loved and served since their puppy days would never again fondle their ears and look into their eyes. They knew that he was dead, and that the old beloved order must now go.

Nell's heart was heavy with strange, dim sorrow, but now a new anxiety possessed her. Her motherhood was the ruling factor in all her thoughts. The men had handled her puppies roughly and laughed at them, and in some subtle way she knew that the future of her darlings was insecure. The one man she could trust was gone; there remained only one whom she had never come to know.

Nell went into the next room when the strangers had departed—a little, dark store-room festooned with cobwebs and piled high with rusty dunnage. She had some notion in mind of hiding her puppies from the strangeness and uncertainty of it all, but the prompting instinct was not quite clear. She tried to hollow out a bed on a spiky heap of mole-traps in the darkest corner of the room, but had to abandon it as not the thing she wanted. She went back to her puppies and nosed a foolish little wisp of hay over them, trying to hide them, trying the best she knew, but her poor, clumsy mother efforts merely left her with a sense of dazed bewilderment.

With the coming of darkness the promptings of the wild dog grew in strength, and acting on impulse, she caught up one of the balls of wool, and carried him whimpering into the night.

Dingo, her slave and guardian, was there to meet her. He seemed at first bewildered, but soon he grasped the general idea. They slipped from shadow to shadow together, pausing and listening. Up the stream they trotted, taking no heed of the rabbits—running flank to flank through the fragrant night shadows. When Nell's jaws ached, and she put the puppy down to rest, Dingo indicated his eagerness to take up the load, but she would not let him. She was afraid he would drop it, I suppose—which is probably what he would have done. Carrying puppies was not his department.

Through the dark ravine Nell led the way, where the shelves were draped with slender ferns, and the rolling of a pebble echoed eerily along the rocky corridor. This was a silent place, where man seldom trod, and at the head of the long defile the waters separated, so as to enclose a tiny island in their sparkling embrace—an island piled high with driftwood among the rocks.

This tiny plot of ground was sacred to Nell's possession. She had regarded it as her own since her puppy days. Here she had basked in the sun when she wanted to be alone; here she had buried her treasures in idle moments; and here to-night, deep in a nest amidst the wreckage, she hid her puppies one by one. She knew that running water all around would help to hide them, but, alas! her half-dead wolfish instincts took no count of foes other than those she knew.

III.

When at daybreak Ben went to the granary and found that Nell had hidden her puppies, he beat her savagely, not because she had done wrong, but because he was angry. Easily now he might have won her confidence and love, but his savage action merely kindled anew her sense of distrust and injustice. She sneaked away to her island, and hid there all that day; and Dingo, willing in his boundless energy, did the work of two. 'Then, if she wants to hide herself, she mun feed herself!' growled Ben, which was only a vain threat, since no one had thought of feeding the dogs since the old man fell ill.

Thus Dingo slaved all day for the master he did not love, and at night he returned to an

empty food-bowl. This did not trouble him much, for with the coming of dusk the cloak of civilisation fell from him, and he loped off into the night on breathless exploits.

Keeping to the hollows, never showing himself against the skyline, Dingo made a detour when another hunting-dog crossed his path; then, peering over the ridge, he saw a family of rabbits nibbling the grass below. Like a wild cat he flattened down and got between them and their burrow; then, quick as a hawk a-wing, he sped into their midst, and a thin-edged scream went up on the night stillness.

Civilisation tends to kill all sense of fatherhood in our domestic dogs, but among the dogs of our hills, where two live together far remote from their kind, the laws of love and loyalty shine forth untarnished by man's hand. Dingo and Nell partook of the habits of the wild, and so the loftiest instincts still were theirs. Thus Dingo, empty though he was, hastened to his lady-love with his prize, and laid it at her feet.

For many days Nell did not return to the farm. Dingo lived his dutiful civilised life all day, and at night he and Nell ran wild together—wild as the red fox of the hills.

At length Nell returned, shamefaced, and doubtful as to her reception. She stood in the offing with ears acock, and gazed at the man—awaiting a friendly word, a sign, when she would grovel penitently at his feet. But Ben was piqued by the knowledge that the dog distrusted him. The thoughts and ways of the dumb creatures were a closed book to him, and so, muttering angrily, he took the rusty gun from its place in the oak ceiling, telling the woman of the house that he would 'learn that dog to run away from home!'

That was exactly what Ben did do. Nell's prompting instincts warned her to flee for her life, but she took a burning charge of shot with her, and thus her whole future was sealed. She knew now, beyond all doubt, that not only would her puppies be unsafe within the reach of this man, but that even her own life could not be trusted in his hands. Nell had left the farm for good.

IV.

Ere many days were past the news leaked out that Ben's little, long-haired bitch was running wild. Old shepherds shook their heads thoughtfully, and said they had known such things to happen before 'when the old man died.' A lank, lean fox came down from the hills, and the poultry-yard of a neighbouring homestead was littered at dawn with the evidence of his visit. Nell was blamed. The keeper took to parading the hills at night, and one night Nell came face to face with him. There was a flash of fire, and again she fled for her life, bearing with her a stinging charge of shot. Thus Nell became an outlaw, regarding all men as her foes—a fugitive of the heather, wild as the winds that swept the bracken-slopes, a skulking vagabond of the shadowy ways who moved in hourly peril of her life.

Dingo continued to live his double life. In day-time he looked the whole world in the face; at night a human footfall sent him bristling for cover. He and Nell learnt the tricks of the relay chase and the ambush; every art of the wild wolf was known to them, but always, always they hunted in silence. The whole wide hills were at their feet, infinite, boundless under the stars. They spent their nights as nature intended, endlessly free, but skulked at dawn to the places fate had assigned them.

Nell had relinquished all claims and obligations towards mankind. The law of the human race no longer bound her. Man had made it clear that she was an outlaw, and as an outlaw she was free to act and choose. But as yet she had harmed nothing that was sacred to man's possession. More than once she had stood with shining eyes, watching the fleeing sheep as they scattered like ghosts into the night, but the lessons of her youth bade her not to follow, and Dingo seemed fearful lest she should. Yet she lacked nothing of the treachery of her sex, added to which was the far more perilous venom that comes with motherhood to the creatures of the wild, and it was only a matter of time ere the savage life she led would tear asunder the last of her civilised bonds.

It came in a thundery night, when the woods were astir with the drip, drip of water, and the very air was heavy with lifeless oppression. No rabbits were about, and Nell and Dingo had penetrated far up the valley, over the high boundary wall, and into that sacred strip of forest where the keeper's cottage nestled, surrounded by the plenteous life that lay within his keeping.

In the depths of a thicket Nell stopped suddenly, one paw upraised, eyes shining, staring into the shadow of a windfall just ahead. Dingo, circling silently, got the other side of the clump, and slowly they closed.

Out of the thicket burst a mottled fawn, and well the two dogs knew that above all other creatures the red deer of the range were sacred to man's keeping. They had been thrashed in their puppy days for so much as looking at them, for many a shepherd had lost his place on the great estate for carelessness which led to the destruction of the royal game.

But to-night Nell's schooling was set at nought. She was hungry, and the sight of that fleeing, bleating fawn was more than any hunting-dog could resist. The fawn dodged cleverly as Nell dashed in. Then from the dripping foliage there appeared an apparition of shining eyes and stamping forehoofs—the mother of the fawn! She dashed for Nell, who doubled for her life,

barely missing the savage blow that would have pounded her into the leaves. With bristling mane and slashing fangs Dingo hurled himself upon the doe, and bore her crashing to the ground.

The fawn, too, fell. Then from the undergrowth there rose a second fawn, and yet another doe rushed madly to its defence. The fighting fire blazed from the sheep-dogs' eyes; the desire to kill bore down and overwhelmed all other thoughts and cautions. Systematically, savagely, they closed upon their new quarry, till the undergrowth around was trampled flat, and the earth was beaten black with pounding hoofs.

The keeper, half in his dreams, heard the frenzied barking of his dogs, and, fully awake, he listened breathlessly. Distinctly he heard the crashing in the undergrowth, followed by the bleating of a fawn. He arose with a chill of apprehension, and went silently out. This was the thing that he had feared; this was why he had dallied abroad at night-time, searching for the wild dog of the hills. Silently, swiftly, he made his way up the mountain-side, listening, pausing, stooping, endlessly alert. A doe dashed by him in the gloom, wild-eyed and terrified; then, running her trail like hungry wolves, came two dogs he knew—Dingo and Nell.

Two shots rang out, but the darkness baffled him. Dingo stopped in his tracks and looked at the man; then guiltily he turned and fled with Nell into the spangled darkness.

Dingo was not touched, but the escape had brought home to him the knowledge of his guilt. He knew that he had done a dreadful and unpardonable thing. He knew that he was doomed. Yet in his soul there was no penitence; only, he wished to hide from man, to live to do the wretched thing again.

V.

Over the high boundary wall they sped—back to the island at the cañon-mouth. At the water's edge they stood, staring with wonder at the flood. The stream had risen since they left from the merest trickle among the rocks to a roaring cataract, which bore on its racing bosom strange octopus shapes, rearing up, and disappearing into the smother of foam. A bellow of thunder shook the hills as Nell plunged in. The current caught her and whirled her like a straw against the rocks of her island den. Gasping, dripping, she dragged herself out, and Dingo boldly followed.

Only just in time, for the puppies lay in a pool of water. The surrounding cataract was rising rapidly; little brown trickles were overwhelming the island, and here and there the driftwood was already astir.

Thus Nell's mother instincts had betrayed her. 'Like to like' is the law of the wild, and the dog who turns wolf must sooner or later pay the wolfish price. Nell led her puppies to a loftier mound, and there, side by side, she and Dingo stood. The brown flood surged up to their very feet, the undergrowth bent beneath it, and with a roar the invading flood poured into the hollow of the island.

Nell turned to her puppies, and caught up the foremost. A new fear was upon her—the fear of a power with which she could not contend. It was as though the avenging hand of God had fallen upon them in the hour of their guilt.

Dingo stood at his mate's side, willing, yet hesitating; then he, too, caught up a heavy, dripping pup, and turned desperately to follow her.

Nell trotted to the end of the island, carrying her load. Bravely she waded in, and boldly Dingo followed. Here the two waters met with a giddy upheaval of foam. Directly below was the dark ravine, where the flood pounded for a mile against the scowling cliffs, with many a cataract and many a whirlpool.

There was no turning back. Side by side they went their way, playing the last great game together—game to the end, side by side in their last fierce voyage of discovery. Whirled like straws, they were swept into the central race, struggling heroically to hold aloft their precious loads. And in the sullen twilight gray a flash of lightning touched with fingers of fire two drifting shapes, tossed like cast-off garments into the cañon-mouth, to be borne away through the depths of that corridor of death.

MOORLAND MEMORIES.

THE breezy slopes with heather brown,
The daisied turf below the hill,
The foaming river rolling down,
The brook that babbled by the mill—
By fancy's light I see them still;
Still from the shore the curlew's cry
Awakes the echoes, sharp and shrill,
And coldly gleams the dull, gray sky.

Again I hear the gray goose call
While flying far across the wold
To seek his bed 'mid osiers tall
Within the winding valley's fold;
Where iris, fern, and marigold,
With lilies fair, by lake and rill,
Disclose each grace in beauty's mould—
Such sights and sounds—I love them still!

When glares the noonday sun too bright
From cloudless, unhorizoned skies,
Or when, with day's soft wavering light,
The desert breeze around me sighs,
I long to live where rivers rise
'Twixt heath-clad mountains, forest-crowned,
And listen to the wild-fowls' cries—
Heard through the tumbling torrent's sound.

Chambers's Journal
SEVENTH SERIES

LIBER MIRABILIS.

By Dr CHARLES M. CLARKE.

I.

SURELY, if ever a work of fiction deserved to be so designated, it is *Uncle Tom's Cabin*—in the first place, on account of its extraordinary success as a novel, for the original publisher in London produced and disseminated through the trade one million and a quarter copies within one year; G. Routledge issued four hundred thousand copies of a shilling edition; Piper, Stephenson, and Spence a quarter of a million at sixpence; while nearly every other firm published one or more editions. Even at the present day, almost seventy years later, the afterglow of success still obtains, as the writer will show presently. In the second place, the effect the book produced was of national importance, for, by the attention it attracted to the slave question, it undoubtedly brought about the American Civil War, which led up to the emancipation of the black population on that continent. As a work of fiction, if on no higher ground, it claims eminence, it being a most powerfully constructed work of absorbing interest—an interest which never flags, and which holds the reader spell-bound; all the characters in the story stand out in bold relief and marked contrast.

The book had the questionable honour of being included in that literary chamber of horrors, the Index Expurgatorius. Still, in spite of the fulmination of the Vatican, it was translated into every European language, and even into Chinese and Japanese.

As the writer is the last living link in connection with the publication of *Uncle Tom's Cabin* in England, a brief account of how the book reached the British public may be acceptable to the present generation.

In the spring of 1852 a young man in the employ of Putnam of New York crossed the Atlantic, bringing a copy of the original edition (in two volumes). He hoped, in view of the interest the book was arousing in America, that he might be able to dispose of this early copy to some London publisher, and to this end entrusted the negotiation to Henry Vizetelly, who brought the work under the notice of Charles H. Clarke (the writer's father). Clarke carried on a large printing business in Bouverie Street, and had recently in connection therewith started as a publisher at 148 Fleet Street. Vizetelly warned Clarke that the next steam-packet might bring over another copy of the book, so that an immediate decision was imperative. Clarke took one of the volumes, slit it down the back, and handed one moiety to Salisbury, his partner in the printing concern; the other he gave to Frederick Greenwood, while retaining for his own perusal the second volume.

Greenwood's report was that at the end of an hour he was in a tremble lest the interest of the story should sink from the height it had risen to, and that from that point he read on with ever-growing confidence and admiration till he came to the night scene in which Cassy maddens Legree with fear. But that chapter, after what preceded it, answered Clarke and Salisbury's question conclusively to his mind, and next morning he handed back his portion of the book, with the advice to settle the matter at once, and print quickly.

The decision to accept Vizetelly's offer was arrived at on the last day of March, and on the 15th day of April the first English edition (consisting of five thousand copies) of *Uncle Tom's Cabin* was issued at two shillings and sixpence by Charles H. Clarke, 148 Fleet Street.

But the trade hung back, the subscription list proved small, and the publisher was reluctantly compelled to regard the production as a failure. For some months the sales were inconsiderable. However, this state of things soon underwent a change, for in August a phenomenal review, five columns in length, appeared in *The Times*. From that date the run commenced. The initiative given by the 'Thunderer' was speedily followed by all the other papers, and the book at once leaped into unexampled popularity. For many months the resources of printer and binder were taxed to the utmost extent; each department worked night and day at high pressure, and on one day alone no fewer than sixty thousand copies were delivered to the wholesale trade.

In the autumn of that year Clarke despatched his confidential clerk, S. O. Beeton, across the Atlantic to interview Mrs Stowe, and convey to her (in the form of three drafts amounting to one thousand guineas) an honorarium in recognition of the enormous profits he was reaping from the publication of her book. This was, I

 [*All Rights Reserved.*]

believe, the first instance on record where an English publisher realised any moral obligation to share his gains with the American author of a successful reprint. On Beeton's return he was taken into partnership, and thenceforth the firm was carried on under the title of Clarke, Beeton, and Company.

II.

During the following year Mrs Stowe visited London, where, amongst other functions in her honour, was held at Willis's Rooms a *soirée*, presided over by Lord Shaftesbury, at which I had the honour of sitting beside her. I vividly recall her personal appearance. Her forehead was high, broad, and intellectual; her piercing brown eyes were set rather wide apart. She had a long, prominent nose, neither aquiline nor Grecian, but a combination of both, with well-cut sensitive nostrils, and a remarkably short upper lip, which allowed her front teeth to be slightly exposed; a large but particularly well-shaped mouth with full rosy lips, below which was a long, determined, though slightly retreating chin.

Her complexion was rather sallow, save for a bright tint of carmine on her high cheek-bones. The shade of her hair was a rich chestnut-brown; it was worn smoothly to show the shape of her head. Running from the summit of her brow diagonally to the nape of her neck was a narrow velvet fillet, from which at the back was bunched up a cluster of curls, while at either side of her face, concealing the ears, hung five full ringlets about seven inches long.

With regard to her costume, a narrow white-lace collar encircled her throat; her gown was of black silk. She stood somewhat below middle height, and carried a full bust, which was accentuated by a sort of loose pelisse open in front, coming down as far as the elbow and worn over the body of her dress. She gave me the impression of being independent in the matter of corsets, and looked a happy, healthy young matron.

Mrs Stowe's manner was extremely vivacious; her voice, pitched in a high key, was musical, and she spoke rapidly in a staccato style with a strong American accent.

In the position I occupied I could not help overhearing her conversation with my father, to whom she related how she was 'roused to such a pitch of indignation when the Fugitive Slave Act was enacted in the States' that she then and there vowed, if her life was spared, to write a book 'which should rouse the nation's conscience to boiling-point.' That she succeeded in her attempt is a matter of history. Then she proceeded to say that the first portion written was the death of Uncle Tom, which, on its appearance in the pages of the *Washington Era*, created so great an interest that she followed it up with other incidents, and expanded it into the form in which it eventually came before the public. She said she 'never expected to realise more from the work than enough to purchase a good silk dress.' As a matter of fact, the sum she received for the serial rights was only about sixty pounds (two hundred and fifty dollars, to be accurate).

A quarter of a century later Queen Victoria received at Windsor Castle the Rev. Josiah Henson, who was the original model from whom Mrs Stowe drew the character of Uncle Tom, the main incidents in connection therewith being the actual experiences of Henson during his slavery. In a subsequent volume, *The Key to Uncle Tom's Cabin*, the authoress gives prominence to the fact, and cites chapter and verse in proof of the accuracy of her indictment of the outrageous conditions under which the slave population existed.

It was during his visit to this country that I had the good fortune to hear the grand old negro minister lecture at Hackney, and I was on that occasion introduced to him. I discovered him to be a most delightful and entertaining old gentleman, brimming over with a fund of anecdote most humorously narrated. He appeared replete with vigour and vivacity, in spite of his seventy-eight years and the hardships of his early life.

Earlier in this article I stated that the afterglow of popularity still remained in the literary firmament; this is evinced by the fact that fifty years after the initial production of *Uncle Tom's Cabin*, Sampson Low issued an *édition de luxe* at two guineas, while shortly after the house of Cassell produced the book, sumptuously illustrated, in some twenty monthly parts at sixpence. But it remained for J. F. Longley to eclipse all records by issuing an unabridged edition of the work, consisting of one million copies, at the popular price of one penny!

At the present day nearly every publisher has a set of stereo-plates from which this wonderful book is continually reprinted, the aggregate sales amounting to some seventy thousand copies annually.

There are a dozen dramatic versions of the story, which are constantly being played at theatres throughout the world; and the latest development is the successful production of the story in film form for exhibition at cinema-houses.

All this, I think, substantiates my claim that *Uncle Tom's Cabin* is without doubt *Liber Mirabilis*.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER II.—*continued.*

III.

THE Gorgon did interrupt revelations, but, as Clement had planned, the trick he had scored was a most useful one. More useful from the fact that the pair of rogues did not know how effectively the inconsequential-looking young Briton had taken measures against them. At all events, they still continued the tactics of trying to shut Clement off from intimacy with Heloise—the very method to which Clement had delicately drawn the girl's attention.

And, of course, the girl noticed it. She began to notice that the Gorgon was always at her side with a sort of leech-like doggedness. She began to notice that the massive Mr Neuburg inevitably took up the siege, as it were, whenever her companion was away. Mr Neuburg talked cleverly and also incessantly, but he wasn't young, and he wasn't that rather attractive and comfort-giving Mr Seadon. Without realising anything of its meaning, Heloise began to perceive that Mr Seadon was, as he had laughingly suggested, being barred out by a crowd.

She was a high-spirited, determined, if high-minded young woman, and she began to chafe under this restraint. She began to show irritation. The honey of Mr Neuburg's unfailingly amiable information and chatter no longer captivated her ears. She showed conspicuous lack of concentration if Clement Seadon happened to be walking the deck; indeed, increasingly, she cut right across Mr Neuburg's flow of honey with, 'Oh, do excuse me for a moment; I must say something to Mr Seadon.'

And sometimes she said it for the entire afternoon.

And as the massive and mountainous man was rebuffed, so was the Gorgon. Her tactful interruptions of *tête-à-têtes* began to meet with but ill-concealed rebukes, and Heloise would say to that curiously impassive woman, who smiled with the mechanical meaninglessness of a doll, 'Do you really want me? Is it really necessary?' Or even, 'Yes, presently; it will keep.'

Certainly Clement's trick had been a good one. He had succeeded in turning their own weapon, their blockade, against the pair. It was they who were becoming unpopular—noticeably so. And, to give them credit, they were quick to understand what had happened. They left Heloise alone; they did not intrude. The Gorgon showed a certain resentful stiffening when Clement dawned upon the social horizon; but her curious and, Clement thought, sinister impassivity, that remarkable sense of smiling without feeling or pleasure, stood her in good stead. She remained quiet, showing no sign of emotion. The massive Mr Neuburg drew off too. He was still a friend, but he no longer absorbed attention. He sat quietly by himself, watching Clement.

Clement knew he was being watched, studied. He knew that a definitely acute brain, in that large and surprisingly nimble man, was keenly occupied with his personality, was deciding how much brain and capacity there was in a man who looked—well, looked nothing more imposing than a lad-about-town. And Clement knew that the intelligence that was busy considering him was not one to be despised. He did not know the extent of the gang that was working to ensnare Heloise, but he felt that Neuburg was probably the brains of it, the master-mind, and that he would act in a masterly manner, leaving very little to chance. To checkmate such a fellow would call for all his ability—and perhaps all his strength and courage. He had looked into the face of this man who also smiled without animation, and who gazed always at something over one's shoulder when he talked—Clement knew that that face masked a personality that would stop at nothing.

All the same, though he was constantly on the alert, Clement made the most of his opportunities with Heloise. It was for the good of Heloise—and it was extraordinarily attractive for himself. He wasn't going to marry her. That was absurd. How could he? Only—only, she was decisively and radiantly pretty. The singular glowing curd-whiteness of her skin, the vividness of her beautiful and delicate lips against the coolness of that skin, the clearness and steadiness of her eyes—all these things gave him an ever-sharpening sense of delight when he set eyes on her.

And her step suited his so perfectly. On board ship one is immensely appreciative of any fellow-passenger whose step suits one perfectly. Her tall figure swung so gracefully, so untiringly, beside him as they walked, no matter if the sea was as smooth as polished glass—which the Atlantic rarely is—or whether there was a 'lop' on. She was as physically fit and as hard as he was, and she took the same zest in out-of-door things. He felt a sort of comradeness, a rightness, in the fact that they should stride up and down the promenade-deck together in such a perfect unison as almost to suggest they were one.

As though they were one! But, of course, that was idiotic. They weren't one. There was no suggestion of their being one. One—that meant marriage. And that question didn't come up. Although, of course, the little lawyer had said—— 'Oh, hang the little lawyer!' he muttered.

'Whom were you hanging?' asked Heloise, who was near, and who had heard the most lethal part of his muttering.

'I was hanging this top-heavy sea,' said Clement genially. 'I wanted to show you the captain's bridge—I've got permission—but with this lop——'

'Show me the captain's bridge—now,' she laughed back. 'The lop doesn't matter—not a *hang*.'

That was part of her attraction. She really didn't care a hang about things that made other people uncomfortable. She enjoyed risks. She was daring enough to go anywhere, see everything. They adventured into all the strange and usually unseen parts of that splendid ship, even as far as the boiler-room. She was eager; she was interested in everything; she had a zest for life. She was an ideal chum. More and more he began to perceive that she was the ideal chum—anyhow, for one particular man. And presently he was saying, not 'Hang the little lawyer!' but 'Hang Henry Gunning!'

Because both had a healthy disregard for exposure, and a healthy regard for fresh air, they became almost the sole occupants of the breezy boat-deck. There they sat daily, and talked; there in the evenings they sat, and sometimes did not talk.

They could not look at the wake. The wake was the special privilege of the second-class passengers, whose quarters were aft; but they did sit very close together in the curious, velvet mystery of the night, the gentle heaving of the great ship lulling them into a great content with one another, their intimate loneliness made perfect by the spacious quietness of the stars.

In these talks they found splendid affinities. They found that they liked so many similar things; not merely sports, books, theatres, the open country, and the other solaces of life, but more significant things. They found that both cared most in life for character: for honesty, straightness, generosity, high-mindedness. They liked intelligent people rather than merely jolly ones. They liked people who did things rather than people who played at doing things. They found that they had a common austerity of ideal in their way of looking at problems—would rather be the losers in any transaction than do anything underhand; they would take the difficult path if it was the right one, rather than the easy if it was wrong.

This brought them dangerously near to the core of the matter they were both engaged on, dangerously near Henry Gunning; but both instinctively veered away from that.

Yet Henry Gunning, or, anyhow, something of him, had to come into the matter. He came in only by implication. Heloise did not speak of him at all as she gave Clement little scraps of her past life. A simple enough life, and rather lonely, as is the life of a girl who has lost her parents, and who, on the whole, prefers to satisfy her individuality her own way rather than follow the crowd.

But he had to come in when she spoke of her journey to Canada; though even in this he came in only as 'a friend, an old friend whom I am interested in.'

This happened when they talked about Sicamous one night.

'I am going as far as Sicamous, at any rate,' she had said. 'And that reminds me, there are things I wanted to ask you about Sicamous. . . . Perhaps you remember—we were interrupted?'

'Something about mines, wasn't it?' said Clement with a careful casualness.

'Yes—I want you to tell me all about mines in that area. Now, please tell me.'

Clement laughed with a touch of dismay.

'But *all* about them. That's a terrifically large order. In the first place, there's nothing to say about them—and then there's everything.'

'That sounds enigmatic. You'll have to explain.'

'I mean by that that there are not so very many mines. Those at Nelson, on Okanagan Lake—silver-mines, they are—are perhaps the most important. But, on the other hand, it's always supposed that there are great possibilities among those rocky valleys.'

'Ah,' breathed the girl, 'there are possibilities, then.'

'Not thinking of going in for mining, are you?' Clement teased, and with a reason.

'N-o,' said the girl. 'It's rather—it's rather because a friend of mine is interested. Deeply interested. I wanted to learn if there is any foundation for—for expecting big things, immense returns, from mining in the Sicamous district.'

Clement was excited. Then it was mining. That was the venture Henry Gunning was supposed to need backing for. He answered without any show of his emotion. 'What exactly are your friend's interests—silver, copper, gold?'

'All of them,' she answered quickly, and Clement thought he saw the character of Gunning at once in that retort. Your unsuccessful prospector is rather like that. He hasn't merely a Golconda of one metal up his sleeve; he has all the rare metals in the world, only asking to be picked out of the surface—if only some one will oblige with the money to buy picks and other necessities. 'All of them,' repeated the girl. 'I understand that—that the claims (that's right, isn't it?) pegged out show rich veins of gold, copper, and silver; and there's also nickel—even platinum. Is—is that possible?'

'I will say,' said Clement candidly, 'it's held to be possible. Prospectors are always saying

that the whole of the district is a likely place for—yes, for all those minerals.'

'These particular claims have been assayed, and have shown excellent results.'

'They have, however, to be worked, I take it,' said Clement. 'With mines you can't really tell until they have been worked.'

'Oh—so,' faltered the girl rather pitifully. 'Then don't you think there is a possibility of an—an immense fortune in such claims showing such good sample results?'

'There might be. There is always that possibility. On the other hand, I should advise your friend to go with extreme caution.'

'You're not—you're not very stimulating,' she said ruefully.

'I'm just being as honest as I can,' said Clement, with a meaning she could not appreciate, for actually he was. His whole instinct told him to pour the coldest of cold water upon that mining scheme; and yet he couldn't altogether in fairness do that.

'I believe you are,' she said softly; and with a surprising intuition she added, 'I believe you'd be honest even against your own interests.'

In the tiny and quite significant pause that followed that touch of curiously personal intimacy, Clement felt bound to say, 'You see, Miss Heloise, mining is a risky venture. You can throw away more money (and more easily) in mining than you can in anything else—not even excepting theatres and newspapers. There are so many things that make it a gamble. The lode or stope may peter out. There may be immense difficulties in cutting shafts. There may be fatal drawbacks in the matter of transport, of working, of labour, and scores of things. Mineral-finds that look good at the first assay may not pay for their keep when they come to be worked. I know these valleys. We came across some seams that looked good. They looked enormously good to a tenderfoot like myself, for example. But the experts, the hardened men, with the party wouldn't look at them. Nothing in them. Not worth the blasting. Your friend certainly would be advised to move with the greatest care in this matter.'

The girl was silent for a while.

'It hurts so to shatter people's dreams,' she said in a low voice. And then she added on a lighter note, 'But I remember—you talked of difficulties that turned on transport. Most of the difficulties do, don't they?'

'Yes; it's lack of transport that kills most mining ventures.'

'Well,' cried the girl, with glee, 'that's a difficulty that doesn't hold good here. The railway runs within a very short distance of the claims. Doesn't that make it sound more hopeful?'

Clement thought; then he said decisively, 'It makes it sound hopeless.'

'Mr Seadon!' she protested, aghast.

'It does,' said Clement, sure of himself. 'Miss Heloise, if those claims are only a very short distance from the railway, then they are claims that could not have been overlooked until now. Don't you see? Railwaymen, engineers, prospectors, scores of people must have had a chance of poking round. If there had been anything good there, it would have been found long ago. Found and exploited. And as it hasn't happened—well'——

'You think there is no chance at all,' said the girl in dismay.

'I think,' replied Clement impressively—this, he felt, was his great opportunity; he must drive home truth into the soul of this girl, though it was a painful truth—'I think that you—that your friend should go into this matter with the most scrupulous attention; that you—that your friend should commit himself' (in his stress he overlooked the gender he had employed) 'in no way. All the dealings should be made through unbiassed experts—unbiassed, Miss Heloise; some big mining consultants with a reputation for straight dealing. Nobody locally. Please, Miss Heloise, I urge you—I urge you to impress upon your friend the need of the greatest care.'

The girl gave a gasp. It was a gasp of misery. Clement felt sore and sorry for her; but he must say what he had to say. Then she replied with pain, 'So you think—you think there might be something—underhand about such a venture.'

'Yes,' said Clement slowly; 'I think there is a great possibility of there being something underhand in it—from what you tell me.'

'O-oh,' sighed the girl, in pain, and she fell back in her chair. She was overcome. Clement knew why she was overcome. His confirmation of the suspicions that the little lawyer Hartley Hard had fired at her had forced her soul to face a terrible conviction. She sank back in her chair in anguish.

Clement, inexpressibly sorry for her, followed her action with his eyes. He would like to help her; he felt in his heart an almost agonised desire to spring to her aid, to do something to soothe her wounded soul. She was so gentle, so young, to have suffered such a shock. He half turned in his eagerness to help her.

Something—a shadow where there should have been the gray-blue light of the open sea—caused him to lift his eyes.

Behind her chair, close behind, crouching against the bow of the boat that shielded them from the wind, filling up the space through which Clement should have been able to gaze straight out to sea, he saw a figure; a great, a bulky, figure; the black, the stealthy, figure of a mountain of a man—listening.

(*Continued on page 99.*)

FOREIGNERS IN ROME.

By E. Beresford Chancellor, M.A.

In the year 1580 Montaigne speaks of Rome as then being '*rappiécée d'estrangiers, une ville où chacun prent sa part de l'oisifveté ecclésiastique.*' Had he been writing hundreds of years earlier or later, he might have made the same remark—at least, in so far as it concerns the presence here of inhabitants of other lands. For Rome is essentially the city of pilgrimage of the world. It is the source whence all civilisation, so to speak, springs; and it is, besides, for vast numbers the river-head of that great stream of religious belief which has flowed with more or less force, but with uninterrupted urgency, through all the centuries with which humanity, for all practical purposes, need concern itself. In this respect there is no other city in the world comparable with it; nor is there any wherein the remains of the past speak so directly to the antiquary or to the lover of the picturesque. The grandeur that was Rome, in Poe's phrase, should hardly have been put in the past tense, for, if there is no such grandeur here now as when the greater Cæsars ruled, there is the grandeur of civilisation superimposed on civilisation, and we have, instead of one complete form, several: Christian Rome overlaying Pagan Rome, the splendours of the Renaissance piled on those of the Republic and the Empire. The result has been that nowhere so markedly as here are so many remains of the past of a great people left in their native ground. To appreciate the glorious art of Greece one need not go farther than the British Museum, where the Elgin Marbles, ravished from a calmly regardless land, are sufficient for, as Ruskin would have put it, a life's liberal study. But to understand Rome no such short cut is possible. You must come to Rome for that. And another point differentiating these two great sources of art and culture is this: Greece is for all practical purposes a thing of the past. It lives in its remote wonder. Its original makers, so to call them, its Praxiteles and the rest, had no successors in the middle or later ages. Rome, on the other hand, can show a kind of apostolic succession in such masters, from those who first drew their inspiration from Greece to those—Bernini, the great exponent of the Baroque, and even Canova, the master of graceful line—who have carried on the glorious tradition throughout the ages. After Augustus had beautified Rome, a succession of Popes—every one knows the outstanding ones in this connection: Leo X. and the rest—began another Rome, and the genius of Michelangelo and Raffaele, Bramante and Carlo Maderna, carried on the splendid tradition, and kept the sacred lamp of art burning for a thousand years.

Hence it follows that Rome asserts herself as a vast museum, but with this difference, that instead of imported beauties, we have them where they were conceived, preserving the very atmosphere of their creators and of the various centuries which saw their birth.

It is hardly to be wondered at, then, that such a centre should have attracted all the great minds of the world, and should have become the Mecca not only for those who have come at various times to Rome for change or from curiosity, but also for those who have been attracted hither by religious sentiment. Even a casual glance will show to the stranger that Rome is proud of its distinguished visitors. As you walk through the Medici gardens you will see statues of Goethe and Victor Hugo; it was the Eternal City that inspired the *Roman Elegies* of the one, and the *Angelo* and *Lucrèce Borgia* of the other. When Mendelssohn was in Rome, he not only indited those characteristically delightful letters, but at least once determined to leave here a memorial of himself in his better-recognised medium, for, speaking of the singing of the nuns in Santa Trinita dei Monti, he remarks: 'I have composed something to suit their voices, which I have observed very minutely, and I mean to send it to them. It will be pleasant to hear my chaunt performed by persons I never saw, especially as they must in turn sing it to the "barbaro Tedesco," whom they also never beheld.' It was, too, at Rome that Gogol wrote his *Inspector-General*, the one bright gleam shining on the otherwise dreary expanse of Russian literature. There is a large memorial tablet affixed to the house where the genius of the North produced his work amid such alien surroundings.

British writers have been more largely represented in Rome, however, than those of any other country. From the days when Milton and Evelyn stayed here to those when the Brownings came hither from their beloved Florence, there has been a succession of English and Scottish literary visitors, no little of whose work has been influenced by Rome's atmosphere. Milton stayed for two months—October and November—in 1638, and during that time was a frequent visitor to the Vatican library, whose keeper, Lucas Holsteinius, delighted in showing him the treasures collected there. It was Holsteinius who presented him to Cardinal Francesco Barberini, who, we are told, on one occasion exhibited a particular condescension to his visitor by leading him into the room in the Barberini Palace when a concert was going on, and presenting him to the assembled guests. It is conjectured that it was here that the poet heard the wonderful singing of Leonora Baroni, of which he makes mention. Milton is also

recorded as having dined at the English College in Rome, among other English visitors, the Traveller's Book of the college containing this entry: 'The 30th October. There dined in our College, and were hospitably received, the following English gentlemen: Mr N. Cary, brother of Lord Falkland; Dr Holding of Lancaster; Mr N. Fortescue, and Mr Milton, with his servant.'

A few years later another notable Englishman was in Rome, in the person of John Evelyn, in whose *Diary* will be found references to this visit, with which most people are familiar. One remembers how he describes, for instance, the gardens of the Villa Borghese as 'a real Elysium of delight, a Paradise,' and how he speaks of the Piazza Farnese as being the spot where 'the gentlemen of Rome in summer take their *fresco* in their coaches and on foot.'

The number of illustrious Englishmen who visited Rome during the eighteenth century would fill a list of portentous length. It was the moment when the fashion of making the Grand Tour was at its height, and all Italy was scoured by young men of birth. Many of these young men became in after-years notable or notorious, and if they are not all likely to be remembered so well as are Thomas Gray and Horace Walpole, many of them stamped their personality on their own day, and have left names, in literature, art, or politics, which have survived Time's obliterating hand.

But it was the earlier years of the following century that saw in Rome a constellation of genius which has never been equalled in earlier or later days. Every one knows how Keats came to die here. Severn's journal has recorded all the sad facts, all the 'hourly anodynes' with which that bright spirit tried to soothe his last days of despair. There is the house where he breathed his last, close by the glorious steps which lead to Santa Trinita dei Monti; there, beyond the city walls, is the beautiful cemetery where he lies—'one whose name was writ in water,' as he himself bitterly expressed it, by the Pyramid of Caius Cestius, with his devoted friend, Severn, sleeping beside him, where

> A light of laughing flowers along the grass is spread.

That line is, as we all know, from Shelley's beautiful lament for his dead brother-poet. Shelley's heart lies not far off, in the new cemetery; that heart which was rescued from the funeral pyre on the shore of Lerici by this other poet's faithful friend, Trelawny, when Shelley's body was burnt in sight of the cruel waves that had cut short his 'thin-spanned life.' Years before, Shelley had been in Rome, and here, amid the ruins of what were once those splendid and surprising baths of Caracalla, he had written his *Prometheus Unbound*.

'The third among these sons of light,' to borrow another line from *Adonais* and daringly to adapt it—I mean Byron—was also one of those to whom Rome was familiar. Indeed, in all sorts of places among his works—in *Childe Harold*, *Don Juan*, and his incomparable 'Letters'—you will find references showing an intimate knowledge of the city of so many a poet's dreams. One can add to these great names that of a far lesser contemporary, Rogers, who has recorded how he loved to wander about in the vicinity of the tomb of Caius Cestius, and whose poem *Italy* attests, if not great poetic powers, at least a tender feeling for the home where the Muse has numbered some of her greatest votaries. His remarks on the cemetery where so many enthusiasms lie quenched, so many hopes have been cut short, so many memories linger, deserve remembrance better, I think, than much of his verse.

'It is a quiet and sheltered nook,' he wrote, 'covered in winter with violets; and the pyramid that overshadows it gives it a classic and singularly solemn air. You feel an interest there, a sympathy you were not prepared for. You are yourself in a foreign land; and they are for the most part your countrymen. They call upon you in your mother-tongue—in English—in words unknown to a native, known only to yourself; and the tomb of Cestius, that old majestic pile, has this also in common with them. It is itself a stranger among strangers. It has stood there till the language spoken round about it has changed; and the shepherd, born at the foot, can read the inscription no longer.'

Yet one other great name comes before us, perhaps the greatest of all, that of the glorious magician, the simple, gentle-hearted Scott. Among the vast crowd that makes up the literature of the world, there is no figure that so appeals, I think, to every one as that of the noble writer who has left us the most remarkable legacy ever bequeathed to any country. At home, I am told that Scott is not now read. I rather think that publishers' returns would tell a different tale. He certainly is abroad, and his name is hailed with delighted recognition where later, and maybe for the nonce more fashionable, authors would be surprised to find theirs absolutely unknown. He may be no longer read, in the sense that one may say Balzac is no longer read, or Rabelais, or Dante, or Homer, but he is for ever, as much as these, an immortal—an immortal not only in view of his incomparable gifts as prose-writer and poet, but because of his glorious attributes of sterling character. When Scott came to Rome—he stayed, by-the-by, but a short time (1832) in the Via della Mercede, in the house where the sculptor Bernini had once lived—he was a broken man. He was fighting that heroic fight with Death's hand at his throat which has alone placed him beyond the pale of his peers. I think in all literature there is nothing so fine as that indomitable

struggle and that superb victory over circumstance.

I have incidentally mentioned the great Balzac, and this reminds me that he, too, was one of Rome's visitors in the early years of the nineteenth century. He has left a record of his impressions, as we might expect: '*Cet air m'inspire quelque chose de grand et de généreux que je n'avais point auparavant: si je rêve deux heures au bord du Tibre, je suis aussi savant que si j'avais étudié huit jours.*'

One can well imagine that that photographic brain would thus assimilate almost instantaneously impressions which it would take the ordinary man weeks to absorb. The French quickness of perception was at its *apogée* in Balzac; but others of his nation have visited Rome and have caught its flavour, so to speak, and its atmosphere, in almost an equally vivid way. One has only to read some of Madame de Staël's descriptions of Rome to realise how carefully she had noted the salient characteristics of the city. I recall a notable passage about the Villa Borghese and its gardens as an instance in point; just as I do those minute, almost guide-booky accounts of the Sistine Chapel with which a recent writer—Zola—has ramparted about his remarkable book on Rome in *Les Trois Villes*. But perhaps it must be conceded to an American to have described the city, in a novel, more meticulously and systematically than any one has ever done, for in *Transformation*, or, as it was originally called, *The Marble Faun*, Hawthorne has noted with loving care all those 'points'—and how innumerable they are!—which differentiate Rome from any other place in the world.

It would be obviously impossible to aim at anything approaching to completeness in giving a list of all those foreigners of distinction who have visited, lived in, and described the Eternal City. Such a list would not only include writers from Montaigne to Maupassant, Edmond About, M. Bourget, Browning, who has given us some wonderful word-pictures of it in *The Ring and the Book*, George Eliot, and the rest, but would take note of men in all sorts of different walks in life, from Luther, who once celebrated Mass in the Augustinian Convent adjoining St Maria del Popolo, and Erasmus, to Claude Lorraine and Nicolas Poussin, who lived and worked close by, and the great Turner, who stayed, during the winter of 1828–29, at No. 12 in the Piazza Mignanelli, and was there to be seen continually sketching at his window. It would include, too, those sad relics of the great House of Stuart—James III. and Charles III., who lived and died in Rome; Queen Christina of Sweden, who sleeps peacefully here after her feverish life; and those members of the Bonaparte family who, at the bidding of their forceful relative, kept a royal state in the palaces of an ejected nobility.

THE CABIN PASSENGER.

PART II.

IV.

SOMEWHAT comforted, they finished the meal, and the two men returned to their duties. Miss Keynes drifted aft. A bacchanalian strain from the cabin announced that Mr Pickett was making merry with Scotch highballs. Curiosity tempted her to one of the cabin port-holes. She peeped in. Just at that moment Mr Pickett happened to be peeping out. He had a glass in his hand, and at once raised it to his lips.

'Your very good health, missie!' he said. 'Guess your poppa keeps a first-rate tap—sure! But if his tap's good, his daughter's better; and you can tell him I said so.'

Miss Keynes at once turned away from the port-hole and surveyed the ocean with a silent scorn that failed of its effect in that it was directed to an object behind her.

'Say, Daisy!' said a voice in her ear.

Miss Keynes stiffened slightly.

'Daisy!' repeated the voice.

Miss Keynes turned with marked exasperation. 'My name isn't Daisy,' she said sharply, 'and I'll thank you not to call me Daisy.'

'All right, Phyllis!' said Mr Pickett cheerfully. 'Anything to oblige. Say, where's your poppa?'

'Poppa's very angry with you,' said Miss Keynes, tapping the deck with her foot. 'I shouldn't be a bit surprised if he kills you after this.'

'Don't you let that worry you, Phyllis,' replied Mr Pickett good-humouredly. 'You tell your poppa that if he isn't good I'll come out and spank him some more. But say, you're a nailer, sure! You're a peach—and some peach! Say—put me wise—how did your poppa come to have a gal like you? Your mother must have been an uncommon fine-looking woman.'

'In the first place,' began Miss Keynes icily, 'my name isn't Phyllis.'

'What is it, then?' asked Mr Pickett sharply.

Miss Keynes had an unguarded moment. 'It's Lucy,' she said, and at once regretted her speech.

Mr Pickett grinned. 'Guess that's what I wanted to know,' he said sapiently. 'Lucy!' he repeated, savouring the name on his tongue. 'Little Lucy! Well, say, Lucy, I've got your

pop's spirit-kettle in here. I was just going to make a nice, hot cup of tea. Like one? I'll hand it out to you in a brace of shakes.'

Miss Keynes attempted a dignified silence. But the sudden longing in her eyes spoke for her. Then, aware that her countenance was expressing assent, she said 'No' very decidedly.

'Sure?' persisted Mr Pickett genially. 'A nice, hot, strong cup of tea—with sugar in it?'

The evening breeze fell chill. Miss Keynes shivered a little. 'You brute!' she said.

'Two lumps?' suggested Mr Pickett.

Miss Keynes glanced about her. She was for the moment alone. 'If you're quick, then,' she said hurriedly.

'Just a minute,' said Mr Pickett, grinning triumphantly. 'The water's boiling.'

Two minutes later he handed a cup out at the port-hole. Miss Keynes gulped it greedily; then, with guilty haste, she passed the cup back.

'Don't suppose I forgive you for what you've done just because I drank it,' she said sternly.

'Feeling better, Phyllis?' inquired Mr Pickett tenderly.

'A little,' she admitted grudgingly. 'But, look here, how long are you going to keep us, poppa and the mate and me, out of our cabin?'

'Ah,' replied Mr Pickett placidly, 'I guess we'll talk of that in the morning.'

'And do you mean to say that I've got to stay out on deck all night?' asked Miss Keynes with indignation.

Mr Pickett's reply was to the effect that so far as *she* was concerned she was welcome to enter the cabin right there and now. Miss Keynes walked away, her head in the air and her cheeks scarlet.

V.

It was with considerable indignation that she approached her father and asked him what steps he intended to take to ensure her a night's rest.

Captain Keynes eyed her sourly. 'That's all right,' he said at last, spitting. 'That's quite all right. I guess the cabin goes. I guess we'll get in when we want to get in.'

He condescended a hint or two of his plans, and Miss Keynes went about looking decidedly more cheerful.

At eight bells of the middle watch Captain Keynes, his daughter, the mate, and three of the sturdiest seamen stole to the starboard door of the deck-house. They listened intently. The wind had dropped a little, and the night was clear and starlit. A steady, rumbling snore came from the cabin, and reached out into the immensity of space as the ripples of water reach out from a stone thrown into a pool. Very softly the captain unlocked the door.

'Now!' he said under his breath. 'Steady does it. Once in the cabin—all together!'

He pushed the door. It did not yield. Captain Keynes swore under his breath. It seemed incredible to him at that moment that he should have overlooked the fact that the door could be bolted on the inside as well as locked from the outside.

'Try the other side, Mr Mate,' he whispered.

Mr Briggin passed round to the port side, and came back to report that the door there had also been secured. One of the crew suggested the use of a spar as a battering-ram.

'And what in thunder's the use of that?' asked the captain angrily. 'We don't want to get into the cabin when he's awake; we want to get in when he's asleep. I've no mind to spend the rest of the night up the rigging, if you have.'

'Seems to me,' said Mr Briggin hopefully, 'that if we were to get the hose in at one of the windows, we could make it pretty uncomfortable for him.'

'We could make it pretty uncomfortable for ourselves when we got back there,' growled the captain. 'Talk sense, Mr Mate—talk sense!'

'Well, sir,' retorted the mate, 'if you can tell me what better we can do'——

'Nothing!' growled the skipper. 'Nothing! In the morning we'll just have to parley. It goes against the grain, but we'll have to parley. There's nothing else to be done,' he added bitterly. 'He's got my shooting-iron inside there.'

'And mine's over the side,' said the mate with equal bitterness. 'Well, I suppose it's as you say, sir. But if ever I get to Frisco, I'll drag Jacob through the docks by the hair of his head.'

VI.

It was a somewhat dejected party that assembled early in the morning for the proposed parley. Captain Keynes had nursed his wrath through the night-watches, but though it had grown beneath his fostering care, he had so far failed to find any method by which he could give it effect. Mr Briggin was physically cold, but deep within him his soul was warmed by the fires of jealousy. He had seen—but still strove to believe that he had not seen—a cup of tea handed from a cabin window to a willing recipient. He looked glum, and felt glummer. Miss Keynes, too, was inclined to be snappish. No nice girl likes to feel that her eyes are red and her nose blue and her hair out of curl. And all this Miss Keynes knew, just as well as though she had seen it; with the added exasperation of not being able to get at a mirror where she might make doubly sure of it, and might possibly remedy it. The whole party, in fact, were depressed. Nor was their depression lightened by the very aggressive cheerfulness of Mr Pickett, who had had a good night's sleep, and whose face, framed in the circle of the port-hole, was reminiscent of the man in the moon.

'Morning, cap'n!' he said. 'Any little thing I can do for you this morning? I guess it's a birthday with me to-day, and I would be pleased

and proud to oblige—anything from a bag of biscuits to a three-round mix up with the gloves. You've only to name it.'

Captain Keynes eyed him sourly. 'See here,' he said, ignoring Mr Pickett's facetiousness; 'I guess you've got a bead on us. I reckon it's up to me to throw my hand in. Well, I throw it right in. It's a hard thing for a man like me to do, but there it is. Now, this is what I've got to propose: for the rest of this trip you'll be considered as a passenger—as a cabin passenger.'

'I guess I consider myself as that already,' answered Mr Pickett dryly. 'But fire away.'

'You'll have the use of the cabin, you'll bunk there, you'll have your meals there, and you won't be expected to work the ship,' went on the captain with the air of one making vast concessions, 'on one condition.'

'Let's hear it,' said Mr Pickett. 'You see, that's how it stands at present. But fire away.'

'The condition being,' said the captain, 'that bygones is bygones. Me and the mate and my daughter is to have the use of the cabin as well. Food and drink we share alike. Maybe you don't know it, but we're for the Society Islands with a general cargo. Well, when we get to Papeete I'll put you ashore, and you can take the steamer and go to Frisco or Honolulu or—or anywhere else you like. That's my proposition, and I can't say fairer. Is it a cinch?'

'After the way you've behaved,' said Mr Pickett, surveying the captain and the mate with some sternness, 'it'd serve you right if I kept you on deck for the rest of the trip.' His eyes wandered towards the girl, who was gazing on him with a disdain somewhat tempered by her consciousness of her present unprepossessing appearance. His face cleared. 'As it is,' he continued genially, 'if I let you in, it'll be for the sake of little Phyllis there. She's a peach!—a peacherino!—and I guess she looks as if it would do her no harm to be put in a hothouse.—Eh, Phyllis?'

'My name's Lucy,' snapped the girl, 'and I'll thank you to call me by it.'

'Sure thing, Lucy!' answered Mr Pickett with a grin. 'I guess I won't forget. Well, see here, are you coming in out of the cold?'

'Guess you'd better open the door,' said Captain Keynes, smothering his rage, and affecting a sheepish grin. 'She can't go in until you do.'

'And neither can you, says you,' replied Mr Pickett. 'Well, I'm going to open. But, see here—no monkey-tricks! I've taken the liberty of collaring your shooting-iron; so, if you, or any of your folk, try anything on—well, I guess they won't know what's hit 'em. That's all.'

'I'm a man of few words'—— began the captain with dignity.

'Mostly bad ones, I guess,' interjected Mr Pickett, unmoved.

'But what I says goes,' continued the captain. 'Our bargain's a bargain till we reach Papeete.'

'It had better be,' answered Mr Pickett thoughtfully. 'That being so, I guess I'd better let you in.'

He threw the door open, and stood back in the centre of the cabin very much as though it had been a twelve-foot ring. Captain Keynes walked in, followed by the mate. After an appreciable pause, Miss Keynes followed. The cabin was a neat one, with a further cabin for'ard which the skipper had given up to his daughter for her own use. Two doors opened, one on each side, to the deck; and for'ard of these, two other doors gave admission to the bunks of the captain and the mate. At the stern was a small cupboard, surmounted by a mirror. Miss Keynes took one look at herself, and with an angry exclamation dived into her cabin, banging the door behind her.

Captain Keynes looked about him. 'There's not too much room,' he said, addressing Mr Pickett abruptly. 'We weren't expecting passengers, you see. This room to port is mine, and the mate berths to starboard. You'll have to put up with the cabin settee to sleep on. This hooker ain't the *Empress of India*.'

'Not by a long chalk,' agreed Mr Pickett cheerfully. 'I don't mind roughing it a bit, and I won't deprive the mate of the cabin settee. His berth will do for me, I guess. I've got the key in my pocket now.'

'And where do I'—— began the mate angrily.

'Now, don't get ratty,' said Mr Pickett. 'It's just a weakness of mine, and you'll have to humour it. I've a fancy for having the door locked when I go to sleep. If I had to sleep in the cabin, I should have to lock you all out on deck; and what a nuisance that would be!'

Captain Keynes bit his lip. 'You don't trust me?' he said.

'Oh, I wouldn't say that,' answered Mr Pickett. 'Only, it's nice to have a key.'

'Well, we'll let it go at that,' said the captain, to Mr Briggin's intense disgust.—'Mr Mate, you'll have to do the best you can. We'll have to oblige the passenger.'

He turned on his heel and walked on deck. Mr Briggin followed; he was feeling both astonished and sore. 'See here, sir,' he expostulated; 'do you mean to say you're really throwing your hand in? Do you mean to say you're going to give that beast best?'

'You wait!' replied the captain, permitting his feelings to escape in a burst of viciousness. 'You'll see! You just give me a bit of time to think.'

'And I'm bunking on the cabin settee whilst you're thinking,' said Mr Briggin in dudgeon.

'You are!' answered Captain Keynes sharply. 'And you'll bunk in the fore-peak, if I tell you. Don't *you* go trying the funny dodge on me. I've had as much as I can stand of it from him.'

'Of course, sir, I'm not saying no,' answered the mate, drawing back. 'But I'd like to know what you're going to do about him, all the same.'

Captain Keynes considered the point thoughtfully. 'That's only fair,' he admitted; 'and, as far as I can see it myself, I'll tell you. No use doing anything on the voyage. I don't see that there's anything to be done. But when we fetch up with Papeete—well, then, you'll slip ashore and get a couple of gendarmes. Tell 'em to bring their swords and shooting-irons. They don't stand much nonsense, the French. Once they're aboard, we'll hand our blooming passenger over to them as what he is—a mutinous seaman. Six months is the least he'll get when I've finished with him.'

Mr Briggin's face cleared. 'Six years is what he deserves,' he said; 'but I guess six months is better than nothing. I'll lay,' he added jealously, 'he'll have no blooming tea-parties in jail.' He hailed the cook. 'Galley ahoy, there!' he shouted. 'Galley ahoy! Bring breakfast aft, and look sharp about it. And bring it hot.'

Captain Keynes nodded approval. 'I can just about do with some breakfast,' he assented. 'Just slip into the cabin, Mr Mate, and get my glasses, will you? There's a trail of smoke away to the nor'ard.'

'Ay, ay, sir,' replied the mate. He went aft in the direction of the cabin.

VII.

Meanwhile Mr Pickett had also come to the conclusion that it was time for a meal. The cabin locker was filled with many delicacies—tinned meats, butter, biscuits, and tea. Hitherto he had subsisted on these, making tea for himself on the captain's private spirit-kettle. But now that harmony had been restored, he felt that he need no longer be expected to provide his own meals, and he was just about to leave the cabin to make inquiries as to breakfast, when the door at its upper end opened, and Miss Keynes emerged from her private apartment, greatly improved in appearance. Her dark hair was neatly dressed; her eyes had had the sleep bathed out of them; her nose had, in some manner unknown to mere mankind, resumed its normal tint. Mr Pickett was duly impressed.

'Hallo, Lucy!' he said; 'you're looking fine.'

Miss Keynes stamped her foot. 'How dare you call me Lucy?' she asked angrily.

'Well, I guess you asked me to,' retorted Mr Pickett, unabashed. 'But I'll make it Phyllis, if you prefer it.'

'You'll call me "Miss Keynes" when you speak to me,' said the young lady, with sharp disdain.

'Couldn't think of it,' replied Mr Pickett promptly. 'It doesn't seem to interpret my feelings towards you.'

'I'm not interested to know your feelings,' said Miss Keynes, regarding him haughtily.

'Guess you might be if you really knew 'em,' replied Mr Pickett persuasively.

Miss Keynes regarded him pensively. Her curiosity was aroused. 'Poppa'd be very angry if he heard you,' she said.

Mr Pickett grinned. 'Guess I could find a way of soothing him,' he answered.

'Well, I think you ought to be sorry for the way you've treated him,' said Miss Keynes loftily. 'You've come aboard his ship; you've turned him—you've turned everything—upside-down; you've kept him out of his cabin; you've made him treat you—you, a member of the crew—as a cabin passenger! You ought to be sorry.'

'Well, I guess your pop ought to be sorry that he's treated me as he has,' replied Mr Pickett. 'I didn't want to be brought on board this slush of a barge. I wasn't asked. I came away through having a drink with a man I didn't know. I wasn't in Frisco for my health. I came there to meet Sam Codger, the Californian heavy-weight. Purse of ten thousand, and half the cinema rights. Now, thanks to your pop and his poisonous gang, I've lost a good chance of forty thousand. I'll not be able to show up, and my backers'll have to forfeit. Call that nothing?'

'Forty thousand!' said Miss Keynes, impressed in spite of herself. 'Do you mean to tell me you can make all that money by fighting in a ring?'

'All that and more,' replied Mr Pickett. 'Mean to say you've never heard of me? Sakes alive! Where were you reared?'

'Of course I've heard of prize-fighters,' said Miss Keynes loftily; 'but I never took much interest in them.' She paused, and permitted her glance to rest a moment on Mr Pickett's vast form with delicate disparagement. 'I've always considered them rather a low class of men,' she added icily.

'But you don't now?' said Mr Pickett, ludicrously hurt. 'You don't now—now that you've seen one?'

'Oh, I don't know that I think you very much of a man,' went on Miss Keynes, pursuing her advantage.

'You wait till you see me stripped,' said Mr Pickett hastily—'in the ring, I mean,' he added, reddening. 'Look here!' (He threw off his jacket.) 'No—don't you be afraid. Look here!' (He rolled up his sleeves, displaying a mighty pair of biceps.) 'There—just you feel that! That's the sort of man I am.'

In spite of herself, Miss Keynes was impressed. She advanced a pace or two in Mr Pickett's direction. Filled with pride, he put his arm beneath her nose. Her small, firm fingers descended upon the muscles and strove to make an impression in them. In vain! She might with equal effect have pinched a bar of steel.

'I say!' she exclaimed. 'Isn't it hard!'

'You betcherlife!' answered Mr Pickett, much gratified. 'Now, just you look here!' Extend-

ing his arm, he brought his huge fist within an inch of her eye. 'How'd you like to get a knock with that?' he asked.

Miss Keynes blinked hastily. 'Not much, thank you,' she answered. 'I should think it would feel like being kicked by a horse.'

'As far as you were concerned, it would be like being trodden on by an elephant,' said Mr Pickett pridefully. 'An upper cut with that would give you a first-class ticket for a better world. That's the sort of man I am. Well—what about it?'

'What about what?' asked Miss Keynes, staring.

'What about it?' answered Mr Pickett luminously. 'You've seen for yourself, and I've seen for myself. You're a peach! I'm a knock-out! Say, what's to prevent us hitching? What's to prevent our going in harness for the rest of our naturals?'

'Oh, thank you,' replied Miss Keynes hastily; 'but when I get married, I think it will be to some one who, if he does hit me, won't be able to give me a first-class ticket for anywhere.'

'Say, who's talking about hitting *you?*' demanded Mr Pickett in an injured tone. 'You don't suppose I've got an arm like this for hitting girls with? Not this child! No. But say, put it that you were my wife, and any young spark got gay with you. Well?' He doubled his fists and threw himself into a pugilistic attitude. 'Say,' he continued with an enormous guffaw, 'that young guy would get the surprise of his life! You can bet on that.'

'I dare say he would,' said Miss Keynes coolly. 'But I don't intend to trouble you.'

'No trouble,' replied Mr Pickett calmly. 'It would be a pleasure.'

'Well, it's a pleasure you're not going to have.'

'I guess I'm going on trying,' said Mr Pickett. 'We've plenty of time before us.'

'You seem very certain,' mocked Miss Keynes.

Mr Pickett grinned. 'That's what the Chicago Dodger said to me in the ring,' he remarked. 'Guying me, he was. I reckon he's saying it now on the other side of his mouth.'

'And I suppose,' said Miss Keynes, after a pause, 'that if you did get your way, and if we did get married, if I was to say anything you didn't like, you'd make me say it on the other side of *my* mouth?'

'No, I wouldn't, Phyllis,' said Mr Pickett tenderly. 'Now, don't you get worrying about the name. It's a name I like. If you and me was hitched, and you said anything I didn't like, I guess I'd just put my arm round you, and lift you on my knee, and put your dear little head on my shoulder.'

Miss Keynes gasped and struggled—not because of his words, but because of the practical illustrations by which he was making them plain. At the same moment Mr Briggin entered the cabin in search of the captain's glasses. He paused and stared.

'Don't apologise, boss,' said Mr Pickett, regarding him cheerfully. 'Phyllis and me was just rehearsing a new piece.'

'Let me go!' said Miss Keynes, struggling desperately.—'Mr Briggin, make him let me go.'

The mate sighed. He was not a coward, but he could not but feel it hard that his lines should have been cast in such difficult places.

'Can't you hear the girl?' he said wrathfully. 'What do you call yourself?'

Mr Pickett did not appear to hear him. 'A new piece!' he repeated dreamily. 'And I guess it's on for a long run. The first performance is at an end.' He let go of the girl, who sprang to her feet.

'There isn't any piece,' said Miss Keynes, brushing back her hair angrily.

'Oh yes, there is,' said Mr Pickett nonchalantly. 'Like to know what it's called? Well, it's called *The Girl who took the Right Turning.* —Say, Mr Mate, I reckon it's about time we had breakfast.'

SOME IMPRESSIONS OF AMERICA TO-DAY.

PART II.

V.

AMERICA has her difficulties, like other nations, and to arrive at a faint understanding of the greatest of these one must realise the enormous size of her foreign population. No visitor to New York should miss Chinatown at night. There is much of great interest to be seen in its joss-houses, restaurants, shops, gambling-rooms, and opium-smoking dens. The people are wonderfully clean, and their quarters, though strangely malodorous to European nostrils, are superior to those of other foreigners around them. There is a joss-house in Mott Street well worth a visit. It contains a great shrine of magnificently carved ebony, within which carved figures covered with gold-leaf are placed. Before the shrine stands a massive table, upon which are arranged the brass jars, joss-sticks, sandal-wood urns, and all the offerings and sacrifices peculiar to this worship. It is before this table that, after lighting his incense-sticks and his sacred paper, the Chinese worshipper makes his devotional salaams, pours his libation of rice-wine, and repeats the ritual of prayer enjoined upon him.

Do not leave Chinatown without walking

through the peculiarly repulsive dark passage where numerous murders have taken place. Also call in at the restaurant of that famous Chinaman, 'Chop Suey,' and taste what he puts before you. I had dressed rice, preserved fruits, and delicious tea, and when I asked for the bill I was told the honour of my company was payment enough; yet they did not know me from Eve.

Do not be daunted by your curious-looking neighbours, nor by the several notices hung round bidding you 'Look out for your hat and coat,' but glance about you at the exquisite carvings and needlework. You will meet with nothing but smiles and the greatest civility. Such cannot be said for the inhabitants of Judea, a network of streets which are interesting but horrible. Six and seven storey brick tenement-houses are crowded to their eaves with humanity. A certain square mile holds a quarter of a million Jews. Eight people in one room without a window is not uncommon.

Between eleven and midnight is the best time to see this quarter, when all the dwellers are in the streets, sprawling before their doors or massed on the pavements. At this hour tiny children are swarming everywhere. I saw many women clad in rags, with fine diamonds in their ears and on their dirty fingers. Visitors are not kindly received in this quarter, and one must be prepared for unpleasantness. It is wise to remain deaf to all rude remarks.

The same warning applies to the Russian quarter at night. It is situated in Chatham Square, East Broadway. Half-a-century ago it was a fashionable thoroughfare; now it is the Central Avenue of the Russian and Polish quarters, in so far as those people can be separated from Jews, Bohemians, Hungarians, &c., who throng a square mile of marvellously crowded tenements.

The Bowery is not what it was in Thackeray's day, when he demanded to be taken there immediately he landed in New York. The houses have been greatly improved, and the Americans have left it, and given way to the Jews.

VI.

If you wish to catch a train from one of the great New York stations you must allow more than the regulation ten minutes, after entering the building. There is no crowd—the place is too vast—but you have quite a long walk before you catch sight of a train. The Grand Central Terminal covers an area of seventy-nine acres. These monumental gateways out of the city must be a sore trial to the old and the delicate, though undoubtedly they combine beauty and magnitude with convenience and serviceability. Incoming and outgoing travellers are segregated, and never meet. No one ever sees a train or a platform until he ascends or descends, as the case may be, by elevator to his particular zone. No train ever whistles. All move silently in and out, operated by electricity. The outward-bound hall, or 'concourse,' as it is called, which contains all the facilities usually found in the waiting-room of a railway-station, is 275 feet long by 120 feet wide. Underneath it lies the suburban concourse, of similar dimensions.

On entering the Pennsylvania Station one passes through great colonnaded façades suggestive of ancient Rome. This suggestion is further carried out in the construction of the general waiting-room, which is a model of the famous Roman baths of Caracalla. The cream-tinted stone which has been used for the entire interior structure was brought from the quarries in the Campagna, near Tivoli, Italy.

Having entered the station, one walks through a long, wide arcade bordered by fine shops. This ends in the Loggia, with enormous restaurants on either side. Beyond lies a wide and long flight of steps which are most fatiguing, and one begins to speculate as to where the trains are. At the bottom of the steps lies a waiting-hall 227 feet by 103 feet. Lofty columns of mellow-tinted walls meet the eye, and opening off the hall are smaller waiting and dressing rooms. The journey to the train is not yet ended. One passes on to the concourse, 340 feet wide by 210 feet long, and having negotiated this obstacle to one's quest, one arrives at length at a high grille. The trains are still invisible. The eleven platforms are all below this level, and each one has its own ascents and descents and passenger and baggage elevators.

I have said one sees no really old people in New York, and after catching a train from one of the great stations one begins to have a suspicion why this is so. Those who survive the appalling rush of the city are compelled by existing conditions to stay at home.

The porter, No. 14, who attended to me was obviously Scottish, and I asked him what his name was, and where he was born. He answered, 'My name is James Calder, and I was born at the old Toll House, Queensferry.'

I inquired if he had ever known a William Calder. 'Yes,' he said, 'I had a cousin, William Calder, who worked all his life for W. & R. Chambers, High Street, Edinburgh.'

On my telling him that Robert Chambers *secundus* was my father, and that William Calder was an old friend of my girlhood, we shook hands warmly, and he refused my tip. He met me on my return from Washington, and saw me off to England from the pier.

Unless you know the ropes you will find yourself stranded with your baggage, and unable to get it moved on arrival at Washington's mammoth Union Station.

The coloured porters, exceedingly smart in pale-gray uniforms with scarlet facings, turn a deaf ear to all pleadings. Your business is, whilst still in the train approaching the city, to give

your baggage-check to the uniformed 'solicitor.' He gives you a receipt, and delivers your luggage promptly to any part of Washington. You pay on its arrival.

Hand-baggage can be taken on a taxi, but it is most important to have as little of it as possible, as you will be obliged to carry it yourself—first down a very long platform, next through a waiting-room 220 feet long, then through a concourse 760 feet long, which boasts an arched ceiling said to be the greatest ever built. You will then pass through a series of triumphal arches, and finally let your burden drop on the pavement and try to catch the eye of a coloured taxi-driver. I do not pretend to know what the gorgeous porters are used for. They scorned all passengers and dollars with eloquent contempt. On your leaving the city an express man calls for your luggage, but if you live near the station you see a long stream of people every morning carrying their own. This station, so badly served, cost eighteen million dollars.

VII.

Washington, as every one knows, is a beautiful town. Its magnificent public buildings are embowered in luxuriant foliage, and every street is lined with trees. There are many public parks with plenty of shade, and the roads are so wonderfully smooth that it is difficult to hear the approach of motor traffic. Caution is very necessary at every crossing. The policeman who directs traffic stands on a platform under a huge umbrella. The city is dominated by the gleaming dome of the Capitol, which, like most of the other great buildings, is approached by innumerable white marble steps, and tiers of terraces profusely decorated with fine statuary. To appreciate the many interesting groups which surround the building several hours are necessary.

On the south side the colossal groups represent Columbus, and here it is that since the days of Jackson the inauguration of the President of the U.S.A. has taken place, in full view of the surrounding multitudes.

One enters on the Rotunda, and in this vast and somewhat obscure space only a colossus the size of 'Old Liberty' would seem appropriate. In spite of the imposing grandeur of the Capitol, one gets an impression of absolute homeliness and simplicity, owing to the freedom with which it can be entered by all and sundry. Working-women, carrying babies, school boys and girls, and tourists like one's self stroll in to rest in the Senate chamber whilst senators are speaking. The galleries are open to the public, and accommodate a thousand persons.

One end is set apart for women when they desire to be exclusive, and behind are their parlour and dressing-rooms, with attendance. Whilst I sat listening to Senator Sherman thundering forth on nothing more exciting than agriculture, conducted char-à-banc parties kept passing in and out in constant succession.

In the Hall of Representatives the galleries hold twelve hundred persons, and are divided into sections. Those not public are reserved for diplomats and the friends of congressmen. Any one can obtain from the doorkeeper a plan of the house, showing where the representatives are seated. The Speaker sits at a raised desk, and below him are the marble desks of clerks and reporters. The Speaker's policeman, the sergeant-at-arms, sits within easy call, and his symbol of authority, the mace, reposes on a marble pedestal on the Speaker's right.

The Capitol is so immense that at least two days ought to be devoted to seeing its interior. The different points of interest are many, and there are two large public restaurants, and many resting-rooms for both men and women, and elevators to the different floors.

It does not bear the faintest resemblance to our beautiful old St Stephen's, save that the laws of a great country are framed within its walls. It is at once utterly simple and magnificently imposing.

I believe that the majority agree in thinking that the Library of Congress possesses by far the most beautiful interior in Washington, besides its true claim to be the largest and most magnificent library building in the world. The public are free to enter and use it, and it ought to be seen by night, when electricity illumines the brilliantly enamelled brick, the marble, and the heavily gilded stucco. The roof dome is of copper. For many years sixty American architects, painters, and sculptors worked on this unique adjunct to the Capitol, and controlled hundreds of skilled labourers. The floor of the main entrance-hall and the various gigantic candelabra are specially worthy of notice. The former is a lovely mosaic of coloured marbles, surrounding a brass-rayed disc showing the points of the compass. The candelabra are of bronze, and gold, and marble, in the form of gods and goddesses bearing globes and torches. One lovely lamp-standard is a Greek altar. There are 100 miles of book-shelves, with a capacity of 3½ million books and 84,000 volumes of newspapers.

The practical work of the library concentrates in the Rotunda, where the superintendent and his assistants can communicate with all parts of the building by a system of 'phones and pneumatic tubes. An underground tunnel containing an endless carrier, upon which books are sent back and forth at great speed, serves the legislators in the Senate for immediate use. The available space for all purposes is largely in excess of that of the British Museum, and the books may freely be read by any one. This reading-room or rotunda is an enormous hall, its ceiling domed to the roof. The floor is occupied

by seats and desks, and on the top floor of this sumptuous library there is a public restaurant.

VIII.

Every stranger ought to visit the Treasury, an imposing building close to the White House. There three thousand women count and recount the State bonds, notes, and revenue stamps.

The packets of 1000 sheets, in requisite size for printing four notes, are deftly counted and scrutinised by girls whom long practice has made wonderfully expert. When any imperfect sheets have been removed, the packets are sent to the bureau of engraving and printing. These notes are carried every morning in an armoured steel car. They are first counted by three persons in succession to reduce to the vanishing-point the probability of error. They are then sent to the sealing-room, where the sheets of four unseparated notes are passed through the small steam-presses that place upon them the red seal of the Treasury of North America, or, as it is abbreviated upon the seal itself, 'Thesaur. Amer. Septent. Sigil.' United States Treasury notes bear engraved facsimiles of the U.S. Treasury, but national bank notes are actually signed in ink by the president and cashiers of the bank using them.

It is in the room adjoining this that one sees that marvellous development of the human hand and eye which enables girls entrusted with the final counting of Uncle Sam's money to do so with a rapidity that is bewildering.

Directly the seals have been printed upon a packet of 1000 sheets of notes they are passed to another machine, which slices them apart. This produces 4000 notes, which are done up and handed to another clerk for final inspection and counting. Untying the packet, and holding it in her left hand, with the face of the notes upwards, she lifts the right-hand end of every one of the 4000, scrutinises for imperfections in texture, printing, sealing, or cutting, sees that numbers are in due order, and that nothing is missing. Standing watching her, I felt thankful that the responsibility was not mine.

One girl passes on an average 23,000 notes a day, surely a speed performance which becomes one of the most wonderful in the range of human industry, when one remembers that habitual application to routine-work is apt to breed not only carelessness, but a sort of mental blindness. Each person to whom the packets are temporarily entrusted is obliged to 'receipt' for them, so that their history may be traced from the paper-mills to the cashier's desk. Though each packet contains 4000 notes, the value of the notes in question may vary from one dollar to four million dollars.

The personality of those three thousand girls interested me greatly. Many of them are very pretty; all wear white muslin and lace blouses; all have their hair elaborately dressed; and their tiny hands are manicured.

The air of the halls is completely changed every six minutes, and there is a welfare worker for each department. The top floor contains a hospital and a large restaurant, and on the roof are a winter and a summer garden and a recreation-ground. There is also a library, open to the public, containing 20,000 volumes.

The White House looked very charming as I saw it lying bathed in sunshine, and surrounded by the vivid green of its lawns and early summer foliage. For America it is quite an ancient dwelling, the foundation-stone having been laid in 1792. In 1814 the British set fire to it, and when it was repaired it was painted white to hide the ravages of fire on its freestone walls. The White House grounds and public rooms are open to all, and on the terrace just behind the house the city children gather on holidays.

The President takes first place in social life, and he begins the year by holding a reception from eleven to two o'clock. The public enter during the last hour, after the Diplomatic corps, officers of the army and the navy, and high officials have been received. Later in the year follows a series of dinners and receptions. An invitation to dinner may not be declined without serious reason—no previous engagement can exempt the invited. The President leads in the lady of highest official rank; the President's wife follows next, upon the arm of the highest ranking gentleman. The Chief Executive is addressed in conversation as 'Mr President.' His wife enjoys all his privileges. She receives first calls from all, and returns no visits. Those who desire an interview must apply in writing. America's President and his wife are, therefore, less accessible than was the late Francis Joseph of Austria, who, when I was last in Vienna, received any one, even beggars, who chose to turn up any Monday afternoon.

The President and his wife can accept or reject invitations as they please, but under no circumstances whatever can either of them cross the threshold of any foreign embassy or legation, though members of their family may do so. At a reception the aides present each person to the President, who always shakes hands. The ladies assisting him shake hands with each person who offers a hand to them. A knowledge of this fact on the part of strangers will avoid mutual embarrassment. Some ladies of the ultra-fashionable world make deep curtsies instead of shaking hands, but the custom is not encouraged.

Women attend the New Year reception in smart visiting clothes and hats. Men dress as for any other ceremonious daylight event. At night evening-dress is imperative.

IX.

There is one amusing habit which I discovered in Washington, but nowhere else—the person-

alities indulged in by many shop and restaurant attendants. The girl serving you, or taking your order, will suddenly break off business negotiations by exclaiming, 'My! what a pretty ring! My! that's a mighty smart hat!'

She then proceeds to examine your clothes and ornaments at leisure. When satisfied, she executes your order. You will not resent this seeming liberty; it is done in such a simple, child-like way. Don't say 'Good-morning' on leaving. Say, 'Good-bye.'

I made a bad mistake which rankles still, though I did ask forgiveness. I was sitting next a woman who suddenly turned to me and asked abruptly, 'What state are you from?'

I replied, 'I 'm from Europe.'

'My! Aren't you American?'

'No.'

'What are you over here for?'

'Business.'

'What business?'

'That's no business of yours,' I retorted crossly, for I was tired and hot.

'Wal, now; fancy your taking my kindly interest like that!' she exclaimed, and I saw actual tears start to her eyes. 'I thought maybe you were a stranger and I could help you.' The gentle reproach in her voice heaped coals of fire on my unhappy head. When I spoke again I was abject. She turned out to be a well-known public speaker, and we became great friends.

Though the ways of some American women may seem to us abrupt, the manners of the American man towards women leave nothing to be desired. I confess they amazed me.

If you step into an elevator that contains, let us say, twenty men, twenty hats are removed with a promptitude that suggests pulling a string. If you are resting in a dark corner of a hotel corridor and a passing man spies you, he uncovers instantly. What is even more wonderful, if you pass along a crowded Pullman car looking for a seat, every man offers his. This is simple truth, and it was no use secretly thinking such un-European civility must be due to the dignity of age or distinguished personality. You do not pass many hours in the United States before discovering that all women are treated alike in this respect.

The great shops in the different towns are often very interesting. If you go to Philadelphia, do not miss 'Wanamaker's.' You will find yourself in an enormous white marble hall, domed to the roof. Round it run marble galleries, and at one end is a gigantic organ. This fine instrument gives recitals every hour, and it is pleasant, whilst strolling about the galleries, to sit down by the balustrade, listen to the music, look down and up to the other galleries, and watch the busy scene. Mr Wanamaker, the multi-millionaire originator of those stores, is over eighty years old, yet he never comes later to daily business than half-past eight. In such shops you will never be asked to buy. You may stroll about at your leisure, and there are no shop-walkers, as in our country. Even if you do not stop there, do not leave Philadelphia without seeing the Bellevue Stratford Hotel. I suppose it is the last word in hotels, and extraordinarily sumptuous—indeed, far too much so for ordinary travellers. Yet it is very representative of modern America. Its cost must have been something fabulous, owing to its profuse decoration and the actual works of art scattered about everywhere. Though you do not need to live extravagantly in it, obviously it is intended for those to whom money is no consideration. It was here I noticed quite a modern innovation which was unheard of ten years ago in the States. In one of the great restaurants of this hotel, where I had several meals, I saw schoolgirls enter alone, and in twos and threes. They were ladies, and behaved with perfect self-assurance and quietness. They ordered their meals very carefully, and with no eye to economy, and they all smoked between courses. Money seemed no object. Ladies now smoke freely in all the great restaurants, but not in the hotel lounges. I found great changes in Delmonico's in New York in this respect. Formerly not even men smoked there. When I first visited New York, thirty years ago, my husband and I dined there, and at a table near sat the late James Gordon Bennett, owner of *The New York Herald*. A mutual friend came up to our table and said, 'They 're betting at Gordon Bennett's table that it 's your double and not you, for he says he saw you in Europe only last week.'

There is a yarn going the round of New York that the ghost of Gordon Bennett haunts his old offices in Broadway, so incensed is he with the editorial change that has come over his beloved newspaper. He was always heart and soul for Britain, and could not bear even to hear us criticised.

I find it not easy to write of modern America without conveying a suspicion of exaggeration to those who have not been there lately. I am confessedly an ardent admirer of Uncle Sam, his sons, and his daughters, but I have striven to be strictly impartial in the fleeting impressions I have set down.

The longer one stays in the United States, the more one hopes that the joint inheritance of Britain and America in the spirit of Abraham Lincoln may smooth the way of mutual sympathy, effort, and restraint. No matter what the trials and provocations of the future, it is surely impossible that Britain and America can be aught but friends. There is no need to emphasise the fact that this desire animates the faith held by millions of men and women of goodwill on both sides of the Atlantic.

THE END.

THE POLAR ESQUIMAUX.

IN association with a great many Arctic expeditions the so-called Polar Esquimaux have played a most useful and important part, owing to their capabilities in connection with hunting and travel in the Far North. The tribe consists of some two hundred individuals, whose habitat is on the north-west coast of Greenland, between 76° and 79° north latitude, and in consequence of their presence there this desolate region has formed the 'jumping-off' ground for various exploring-parties. Especially has this been the case of late years in regard to the Danish expeditions which had for their main object the determining of the outlines of northern and north-eastern Greenland.

The state of isolation in which these people lived for so long, without any connection with the rest of mankind, was remarkable. Their nearest neighbours to the south, the Esquimaux from Upernivik, had never fallen in with them, although they had seen their sleigh-tracks on the ice of Melville Bay. It would seem that in Danish North Greenland the existence of such a tribe was believed in from an early date, as in his diary for the year 1771 Paul Egede states that a 'colony' had been established at Upernivik in 73° N.L., and at the same time remarks that 'there are said to be people living still further north—in 75° N.L.'

In the year 1616 Baffin reached the entrance to Smith Sound, which he believed to be a bay. This voyage gave an impulse to the whale-fishery in Davis Strait, which the Dutch began in 1619; but two hundred years elapsed before the existence of the Polar Esquimaux was proved. In 1818 the British Government sent out an expedition under Sir John Ross ('the elder Ross') with the object of finding the North-West Passage. With the two ships *Isabella* and *Alexander* he sailed up Baffin Bay, visiting the Danish colonies on the west coast of Greenland on the way. The vessels then continued on north, past the most northern regions which had hitherto been visited by the whalers, and entered Melville Bay (75° 54'), where they found a tribe of Esquimaux who had never seen a white man before, and whom Ross christened 'The Arctic Highlanders.' From his ship he had seen eight dog-sleighs in Prince Regent's Bay to the east of Cape York. Much difficulty was experienced in getting into actual touch with these people. Scared at the appearance of the new-comers, they sent their women and children into the interior, and only after the display of considerable diplomacy were the men induced to come on board.

Ross states that they believed themselves to be the only inhabitants of the earth, and he adds that they evidently had no idea that other human beings lived farther to the south.

The voyages of Ross, and of Parry in 1819, through Lancaster Sound induced the English and Scottish whalers, who had till then conducted operations in more southern latitudes, to proceed to the newly discovered areas in the north.

Memories of Ross's visit in 1818 are still extant among the Polar Esquimaux. Knud Rasmussen, the Danish explorer, says that there still lived in 1903 an old woman whose grandmother had foretold that a large boat with masts would make its appearance from the sea, and, lo! one summer's day, after the winter ice had broken up and only a little strip remained between Cape York and open water, the ship turned up, and came alongside the edge of the ice. Ross had named two promontories at the entrance to Smith Sound after his ships, and instead of proceeding farther in a northerly direction, he sailed down the west side of Baffin Bay without finding any North-West Passage, and returned home with a merely negative result.

After that there came more and more vessels to Cape York and its vicinity, amongst them the ship *North Star*, which passed the winter of 1849–50 in the bay, which was named after it, and where the settlement of Thule now stands. It is well remembered by the Esquimaux.

In 1850 a ship arrived at Cape York under the command of Captain Austin, who was taking part in the search for Sir John Franklin. He took away with him one of the tribe called Qualaseg, who was afterwards baptised under the name of Erasmus York, and was drowned in England in 1856.

In 1852 another expedition, under Captain Inglefield, got into touch with the Polar Esquimaux. On this occasion Inglefield Gulf was discovered, and for the first time Smith Sound was traversed by a ship, and so found not to be a bay. Later on many expeditions sailed up through Smith Sound, which proved to be a passage to that northern Arctic Sea where so

 [*All Rights Reserved.*]

many had expected that open water would be found, and therefore a route to the Pole.

The American Captain Kane was compelled to pass the winter of 1853–54 in Rensselaer Harbour (78° 37′ N., 71° W.). Some members of his expedition made an ineffectual attempt to reach Upernivik in August 1854. They were obliged to live for some time in a stone hut, and would undoubtedly have perished of hunger had not the Polar Esquimaux enabled them to return to their ship in December. Kane was the first to give detailed information with regard to these people; his interpreter, Hans Hendrik, was a West Greenlander, who, however, left the expedition on its return home, and spent several years among the Cape York Esquimaux. When Dr Hayes's American expedition came to these parts in 1860, they took him and his family on board to act as 'Tolk.' The winter of 1860–61 was spent in Foulke Fjord at Etah.

Some few years afterwards a migration of Esquimaux took place from Baffin Land, and these introduced among their 'Polar' brethren several new means of livelihood.

In 1891 Peary began his series of expeditions with a stay among the Cape York Esquimaux. He wintered for the first time in 1891–92 in M'Cormick Bay, and in 1894–95 in Bowdoin Bay, on the north side of Inglefield Gulf. In 1896 and 1897 he only made summer journeys to the Polar Esquimaux territory, in order, amongst other things, to secure certain great blocks of meteoric iron of which Ross had heard. On his fifth expedition in 1898–1902 he sailed his ship far up the northern part of Smith Sound, and, following the example of the whalers in Hudson Bay, took with him a number of Esquimaux to act as hunters and to drive the dog-sleighs. In 1905–6 and 1908 he acted similarly. On the first of these two expeditions he had on board no fewer than seventy Polar Esquimaux, or about one-third of the male portion of the tribe. On the return voyage, late in August 1906, eight of the Esquimaux families became dissatisfied with their rations, and left the ship in Lady Franklin Bay. These families spent the winter in the Lake Hazen region, to the west of Robeson Channel. The following spring they travelled over the ice to Etah, on the Greenland side, where Knud Rasmussen, the Danish explorer, found them shortly afterwards, none the worse for the long journey, most of which, on account of want of dogs, they had performed on foot. In 1907 the American Whitney Expedition came to Smith Sound with Dr Cook on board. The latter spent the winter at Annatok, to the north of Etah, and started therefrom on his much-discussed North Pole expedition. Professor Steensby writes: 'In this connection the principal interest for us is that he showed the Polar Esquimaux the way to the musk-ox region of Ellesmere Land, which had been discovered by Sverdrup.'

Of late years the Danes have kept up a connection with these dwellers in the Far North, from which the latter have benefited in no small degree. From April 1903 to January 1904 Mylius Erichsen and the other members of his expedition resided amongst them—for the most part on Saunders Island; and in return for the hospitality extended them by the Esquimaux, the Danish Government sent supplies of firearms, ammunition, &c. From April 1907 until May 1908 Rasmussen lived amongst them in regular Esquimaux fashion; and in the summer of 1909 the Danish Missionary Society sent him to found a mission-station in North Star Bay, the party including several scientists. A house was built, and two Greenland missionaries remained there. Rasmussen also established a trading-station—'Thule'—in the neighbourhood of Umanak, on Wolstenholme Sound. Since then Rasmussen has been several times amongst these Esquimaux, and from his trading-station he and his associate, Peter Frenchen, made a journey with dog-sleighs to north-east Greenland.

Owing to the events above referred to, the conditions of life for the Polar Esquimaux have no doubt been considerably improved, inasmuch as for their bear and fox skins they can now obtain various products of civilisation; but since the introduction of firearms they have lost a good deal of their skill with the primitive weapons which they formerly employed; and it is to be remembered that communication with these remote parts of north-western Greenland is extremely uncertain, and supplies of ammunition are, therefore, not to be relied on.

When the Polar night, which in the Cape York region lasts for one hundred and two days, comes to an end in February, the Esquimaux leave their winter dwellings, and proceed with dog-sleighs to the best places for walrus-hunting on the edge of the fast ice, where they live in snow-houses. In early spring they also shoot and harpoon the seal. When May comes round the ice becomes, as a rule, insecure; the sun shines all day long; and, the snow-houses being no longer suitable, the Esquimaux return to tent life. The great bird colonies have once more become inhabited, and in June large numbers of birds and eggs are taken there.

As recently as 1891 bows and arrows were employed in reindeer-hunting in autumn, but three years later firearms had completely taken their place.

'The real bear hunting-ground,' says Eivind Astrup, 'lies to the south of Cape York, on the frozen surface of Melville Bay. There on the desolate wastes, far from home and kindred, the Esquimaux have fought many a desperate battle with the mighty white bear. Courage and presence of mind are necessary for such a conflict, and it is by no means every one who can bring it to a successful issue.'

THE MOUNTAINOUS MR NEUBURG.

CHAPTER II.—*continued.*

IV.

CLEMENT SEADON had definitely warned Heloise Reys of something underhand, something malignant, lurking behind the reason for her journey to Canada. The master-mind of the gang who wished her evil had heard him give Heloise that warning.

That meant only one thing. The big man Neuburg knew that Clement had struck a blow that endangered his criminal plan—Clement was certain it was criminal. He must know that Clement would continue to strike at that plan until he had broken it, until he had opened Heloise's eyes completely, rescued her from the evil web by which she and her great fortune were to come into the clutches of the gang. And knowing that, Neuburg would strike too.

Clement Seadon did not minimise the other's abilities. He knew quite well that to secure Heloise's fortune of over a million pounds the massive rogue would stop at nothing, would dare anything—would even remove any one who threatened his scheme. What exactly he would try to do Clement did not know; but he was on the alert. He would be ready for anything and everything.

Clement was thinking these things over as he sat in his cabin but a few minutes after he had seen that great and sinister figure crouching, listening, in the dark. The conversation with Heloise, the warning against dabbling in mining, had already come to its natural end, and Clement had seized the first opportunity to take the girl away from that place where the big man was watching and listening. He knew that Neuburg had heard all. He knew that he would brook no interference with his dark intentions.

Clement knew that, and put the consideration aside. It must wait on events. What he was thinking about now was the effect of his warning on Heloise. He thought of her with pity, and with intense anger that one so supremely lovable should be made the sport of a cruel plot.

'She's got to be rescued from those blackguards,' he told himself. 'That any girl should be in the clutches of such a gang is horrible to think. That Heloise should be the girl—it's more than horrible; it's vile.' He thought of her, so slim, so exquisite, so high-minded, a victim of her very honesty of soul. 'But she won't be a victim,' he growled. 'I'll save her. I'll beat them.'

And again he began to think how he could do it; but now he wanted to do it swiftly, so that she might be snatched from the clutches of Neuburg and his fellow-rogues at once.

Had he, he wondered, made an effective stroke that night? Had he, by his strong warning against something sinister at work behind this story of a great mining venture, opened her eyes—fully opened them, made it possible for her to break off this—this beautiful folly of going to the aid of her girlhood's lover?

He examined the doings and the sayings of that evening, and told himself—No.

She was not, he knew, one easily to be put off from what she considered the right, the honourable, line of action. He had opened her eyes, perhaps, to the possibilities of fraud in the matter of the mines, but she was not of the type to accept any judgment until she had rock-bottom proof of its soundness. She would go to Sicamous; she would see Gunning; she would go into the matter of the mines. Not until she had received expert opinion would she decide. There was, of course, always the possibility that the mines might be a genuine proposition.

But she would go to Sicamous—that was the crux. He was sure she would do that. She would see Henry Gunning—because seeing Henry Gunning was the whole reason and meaning of this trip. And seeing Henry Gunning—that was the great danger, Clement felt.

Seeing Henry Gunning—how many emotions that would recall to a nature so sweet and so genuine as that of Heloise! There would be a glamour about the reunion. There would be all the fine, the tender, emotions of girlhood—that period of splendid unrecking emotions. She would see Gunning through a rose-tinted mist of memories. . . . And that infernal gang would see to it that Gunning made the most of it.

They would bring him up to the scratch. They would see to it that he was presentable, that he was lover-like, that he minded his p's and q's. They would coach him, insist upon his playing all the cards that would win her at such a poignant moment. He would be the decent, honest, heroic man fighting nobly against ill-fortune. He would be the Galahad-soul who, loving her, was yet so proud in his love that he could not bring himself to sue for her until he had made good.

That would be the rôle played by Gunning, and it might very easily be a winning rôle. She might so readily succumb to the glamour of memory, of the moment, of his manly attitude; succumb before she had time to learn exactly what type of man he had become, before a protracted intimacy had rubbed off the gilt, and shown her the truth of him. . . . Yes, they wouldn't give her time. They would force her to marry Gunning before he had a chance to reveal his real, present nature. And once she had married him——

Clement stopped thinking; it was unbearable to think further. 'She mustn't marry him,' he said fiercely. 'She can't marry him. She must be prevented at all costs. I've got to find a way.'

And as he thought that, the little lawyer's admonitions came back to him—came back to him, and he wasn't irritated. It seemed, after all, that the little lawyer was infinitely wise. What other way was there? What other way was workable?

'Yes,' he muttered, 'what other way is thinkable—even apart from the scallywag Gunning? . . . Clement, my dear ass, do look things in the face. What's the good of beating about the bush? You do love her. You can't bear the thought of her loving any one else. You do want to marry her. . . . And it is the real and only way to save her.'

He thought on, turning over all the aspects of the matter. 'Yes—and I think I can make her love me. . . . Yes, I think I can do that. I think she likes me. I think we hit it off tremendously. I think the—the beginnings are there. If I only pressed matters; and, by Jove! I will press matters. I *do* love her, and she'll love me. I'll make her. I'll force her to love me. I'll tear her away from those rogues by love. . . . I'll make her marry me. . . . She shall marry me.' He smiled happily at his decision. 'It's the thing I want most in the world,' he finished. 'And it will put a spoke in their wheel.'

V.

And even while he was contemplating putting a spoke in the wheel of the gang, they were actually putting a spoke in his.

The big Mr Neuburg, who had overheard Clement warning Heloise, was not a rogue to waste time. Directly the young man's eyes had turned back to the girl—although Mr Neuburg, it should be said, had no idea that Clement had seen him—and the conversation had become commonplace, the big man slipped from his hiding-place, with that curious silent swiftness which went so strangely with his bulk, crossed the boat-deck noiselessly, and went down to the promenade.

He found the Gorgon sitting there, and he dropped into the seat beside her. What he had to say was not very much, but it was apparently to the point. She listened attentively, nodded, and when he finished she rose immediately and went down to her cabin.

But before she did so she took from him a paper.

'Make this your opening,' Mr Neuburg said. 'I know you are clever; this is a time for being very clever. Be very natural; be very sympathetic; do not show this letter has any significance for you.'

When Heloise, tired and dispirited, came down to the cabin, she found her companion already half undressed and not very talkative—she never was. It was no different from any of the going-to-bed scenes that had taken place since they came on board; that is, it wasn't—until Heloise, stretching out her hand for her hair-brush, that inevitable feminine implement, encountered a folded sheet of notepaper. She picked it up absently. It was a letter, a business communication, that had been folded lengthways in three, and the printed heading was on the outside. She read the name of the firm who had sent it—Rigby & Root.

'Méduse,' she said in a surprised voice, 'did I leave this lying about?'

'Did you leave what lying about, Loise?' said the companion in a quiet voice, though, for all her apparent indifference, her singularly immobile eyes seemed to gleam below the surface in the moment before she turned to see what 'this' was.

'This letter—from my lawyers?'

'Yes, you did,' said the companion. There was the nicest tinge of reproach of a grown-up's chiding in her voice; it was beautifully done. 'You did—on the promenade-deck. Yes, my dear Loise, it was on the very deck. I actually kicked it out of my way before it occurred to me that it really was a letter, and not a dirty piece of paper. Then I picked it up, and saw that heading on the outside—Rigby & Root. And I was surprised—your lawyers, of course; I knew that—so naturally I brought it straight down here.'

'How could I have taken it up on deck?' said Heloise, puzzled.

'That I don't know,' said Méduse pleasantly—'unless you are like me, and use the first thing that comes to hand as a book-marker. It's not always wise. I remember once opening a book at a young women's religious-instruction class, and the piece of paper I had used as a marker slipped out for all to see—and it was a handbill of the most lurid sort of play—a very fast play even. You see, I'—— Her manner was gossipy, perfect, but she did not have to carry her garrulous anecdote to a finish.

First Heloise said, 'But a lawyer's letter!' And then with a sort of gasp she cried, 'But it's not my letter.'

The Gorgon switched round, smiling indulgently. 'My dear—but I saw the name at the top—Rigby & Root.'

'Yes, it's from Rigby & Root,' said Heloise in a curious voice, for she was at that moment, and abruptly, a prey to strange emotions, sudden emotions of doubt and suspicion.

'Well, if it's from Rigby & Root'—— said the Gorgon indolently.

'It's addressed to Mr Clement Seadon,' said Heloise in a dry voice.

The Gorgon's look of smiling amazement was an admirable piece of acting. 'But, my dear,

whatever are your lawyers writing to Mr Seadon about?'

And that well-barbed dart was fired with beautiful precision. Without the slightest appearance of interest, of malice, the Gorgon had underscored the significant fact that Mr Clement Seadon was connected with the little lawyer, Hartley Hard (a partner in Rigby & Root), who had shown himself so prejudiced against Henry Gunning and Heloise's journey to Canada. She looked at the girl, her eyebrows raised in faint amusement and surprise. 'What could Mr Hard be writing to Mr Seadon about?'

Heloise did not read other people's letters, but the circumstance made it impossible for her not to read that short and very business-like communication. It was an unthrilling communication. It dealt with the sale of certain stocks, and the buying of certain bonds. It was not signed by the irritating Mr Hard. 'It's not from Mr Hard,' said Heloise. 'It's from Mr Root himself.' (Rigby was dead.) 'And it's about nothing in particular—just business. Apparently Rigby & Root are Mr Seadon's lawyers also.'

Heloise had an air of dismissing any implication of underhand conduct. But she had not dismissed it. The surprising fact, brought before her mind so suddenly and neatly, made her feel that she had been trusting somebody who could not be trusted. He was in league with the man who had tried to hamper her movements. She tried to tell herself, of course, that there was no ground for such a thought; people can have the same lawyers without conspiring with those lawyers. But the shock of it, the coincidence of it, cut the ground from under her. This young man who had only just now taken pains to set her against Henry Gunning and his mining schemes was intimate with her lawyers, who had also taken pains to set her against Henry Gunning. The facts seemed too pronounced to admit of coincidence. And while she was feeling thus, sore, rankled, the clever companion pushed the barb of suspicion a little deeper.

'How strange that you should both have the same lawyers!' she said with an air of innocent wonder. 'How strange that he should know that Mr Hard who has been so annoying to you!'

It was, of course, the attitude of Méduse Smythe to pretend that she had little or nothing to do with Heloise's trip to Canada. She pretended all along to play a passive part. All the initiative was supposed to come from Heloise. Heloise alone was supposed to have been responsible for the sudden reawakening of tenderness for her boy lover. Heloise alone was supposed to have thought of the chivalrous idea of travelling to Canada to see Gunning again—and perhaps help him. It was Heloise alone who was supposed to be responsible for the determination that carried the project through; who had, in spite of all opposition, started out on this journey to Sicamous to find a proud and yet staunchly loyal lover. Méduse Smythe was clever. She had the master-brain of Mr Neuburg to prompt her, and she had played her cards subtly, so that, although it was she herself who had inspired the high-minded girl to undertake this adventure, she was yet able to pose as no more than a lucky and accidental link in the chain of circumstances. Heloise thought of her only as a companion who was but faintly and sentimentally interested in an act of her employer's life over which she had no control. It was to keep up this air of being altogether outside the business that Méduse had observed, not that Mr Hard had been annoying to 'us,' but that Mr Hard had been 'so annoying to *you*.'

Her attitude gave her so many advantages. Thus, when Heloise said in answer to that little flick on the raw, 'I wonder whether he knows Mr Hard?' Méduse was able to reply with an admirable and impersonal air, 'Well, it didn't seem important before, but it may explain why he has monopolised you since you came on board.'

Heloise was suddenly aware how easily, how frequently, she had slipped off with Clement Seadon. Had he monopolised her? Why? She remembered how she had talked to him about Sicamous, about mining; how he had warned her. . . . Was that the reason? His lawyers were her lawyers. . . . Her lawyers had warned her, too. Was that the reason?

And then, as the girl sat quietly, feeling suspicious, miserable, hurt, the clever Miss Méduse Smythe improved the shining hour. She fired another little barb. 'Of course, you are both young, and he is very handsome, and has charming ways with him. I could understand your getting on so well together—indulging in even a little ship-board flirtation.'

Heloise gasped. She was acutely conscious of Clement's good looks, his charming ways. Had they been used to an end? And flirting—had she flirted?

'You think I have been flirting?' she said in a low, breathless voice.

'You?' smiled Miss Méduse tolerantly. 'Oh, no, I don't think you flirted, my dear. I know how you feel about your Mr Gunning.' Heloise winced; she had not been feeling very much about Mr Gunning lately. She was unpleasantly reminded of her inconstancy—as Miss Méduse Smythe meant her to be reminded. 'I knew *you* were safe enough,' the smiling companion went on, 'but I don't know about that young man. He seemed—well, yes, I must say, I think he flirted.'

That practically ended the conversation. A conversation with apparently very little in it, but a very telling conversation, all the same. When Heloise went to bed, she carried it with

her. And as she tossed, unsleeping, its different phases kept turning over in her mind, turning over and over with something of the steady throbbing of the engines in their ceaselessness.

So that, while Clement Seadon, also awake, was tossing in his bunk, the throb of the engines beating out entrancingly the thoughts, 'I'll marry her . . . I love her, and I'll marry her . . . I'll make her marry me . . . I'll save her through loving her,' Heloise lay awake, asking herself, 'Is he in league against me? Is he deceiving me? After all I thought of him, isn't he tricking me? His lawyers are my lawyers. He has wormed out my secret from me—where I am going—what is the venture poor Harry Gunning needs support in—things my lawyers did not know. Things they wanted to know? Was that accidental, or was it cunning? Is he fighting against—Harry?' She shivered in disgust at herself. 'Harry . . . have I acted honourably towards Harry? I have flirted with this man—flirted! I've enjoyed his company; I've come to like him.' She could not go on. She dared not go on. She dared not put her feelings for Clement Seadon under close examination. 'I've behaved dishonourably. I've forgotten Harry for this man who has—has been working against Harry.' Her heart chilled. 'Perhaps his—his flirting with me was part of his plan against Harry. . . . And he knew about Harry?'

The whole of these thoughts jumbled and tumbled together in her anguished mind. The duplicity of Clement Seadon became entangled with her own inconstancy towards Henry Gunning, until, in the end, they became one and the same thing, and Seadon was the arch-villain responsible for all—as the adroit Mr Neuburg and the clever Miss Méduse Smythe had meant him to be.

And so, when the morning came, Clement rose, saying with immense purpose, 'I'll do it to-day. It's the last day; to-morrow we land. I will tell her I love her to-day. I'll *make* her love me.'

As he vowed this with great cheerfulness, Heloise, rising jaded, worn out, with a mind incapable of clear and unprejudiced thought, said, 'I must find out. I'll put it to the test. I'll confront him with this letter—with what I feel. And if I am right'——

She knew pain, a little pain, but that only strengthened her resolve. If she found out she was right, then it would be finished. Clement Seadon would not be allowed to intrude into her life again.

(*Continued on page 120.*)

MORE DUST FROM AN ENGLISH LAWYER'S PAPERS.

By G. H. Browning.

I.

A FEW weeks ago the wise judges of the law did a curious thing. The Court was called upon to deliver judgment in a case of forbidden fruit, and their dictum sounds strange in the ears of simple laymen. It was an old, old question that had sown dissension between erstwhile friendly neighbours; the apple of discord, in a literal sense, was cast down between them, though the prize might be said to involve not so much the vanity that yearned for the judgment of Paris as the desire that consumed the soul of Ahab when he turned his face to the wall and would eat no bread.

The story of the quarrel is this. There were some trees standing in the plaintiff's garden—apple-trees loaded with a goodly show of fruit. Now, the branches of the trees spread far over the walls of the garden, and overhung the grounds of a neighbour. There they displayed their luscious fruitage, and there also they cast their shade, and so trespassed upon the neighbour's undoubted rights. For it is a law of the realm that he who owns a piece of land possesses not only the ground down to the centre of the earth, but also the sky above it as far as the highest heavens. Hence, if another man's trees overhang your land, you may with impunity cut down the offending boughs. This neighbour, therefore, in the exercise of his well-established rights, lopped off the wandering branches of the apple-trees and cleared the air. So far, so good. Right is established, and no one legally aggrieved. But having done this, the neighbour reasoned with himself something after this fashion: 'If the law empowers me to cut down the branches of these trees, it will, logically, permit me to use the fruit which was growing upon them. Otherwise I must either suffer good fruit to go to waste or accept the burden of carrying it to the owner of the trees.' Apparently a reasonable argument; and, deeming it so, he took the apples and sold them. Now, apples were scarce that year, there had not been such a scarcity, or such high prices for apples, within the memory of living man, and in consequence the arbitrary one realised quite an appreciable sum for his lightly obtained crop.

At this point the owner of the trees stepped in. He, whilst admitting the right of his neighbour to abate a nuisance by cutting off the straying branches, argued (and here, again, very logically, it would seem) that all the law in the land could not in any imaginable circumstances make the fruit of his own trees become, willy-

nilly, the property of another. So they argued it out, and there was much talk 'about it and about,' but apparently, like old Omar, they came out by the same door where in they went, for in no way could they come to an agreement. Accordingly, therefore, the discussion was transferred to another place where decisions are made and enforced. The owner of the trees sued his neighbour for the value of the apples. The Court considered the facts and the ancient principles of law which have governed such decisions throughout the centuries, and in the end it decided that, although the neighbour was quite justified in dismembering the trees, he was not entitled to appropriate the apples; and the ingenious reason for the judgment was that directly the apples were severed from the trees they became what the law terms 'chattels,' and the ownership of those chattels remained in the plaintiff. So the neighbour had to pay.

II.

This pastoral subject reminds one of another, which has a law as old perhaps as any in our land. It is the subject of the swarming of bees, and it may be that those disabled soldiers and others whom the Government, in an attempt to restore the shattered industry, is now assisting to establish themselves as apiarists will be interested to know the lore of our forefathers concerning an aspect of this profitable phenomenon.

'A swarm in May is worth a load of hay,' says the old tag; and when, in May or otherwise, a goodly proportion of your bees suddenly grow joyous to the point of delirium, and wing madly away from the hive to seek new quarters elsewhere, it will be well to consider what are your rights in following them across your neighbour's land. Mr Tickner Edwardes, in his *Lore of the Honey-Bee*, tells us of an old writer who laid down the law as follows: 'If they' (that is, your swarm of bees) 'will not be stayed, but, hasting on still, goe beyond your bounds; the ancient Law of Christendome permitteth you to pursue them whithersoever, for the recovery of your owne.' But the ancient scribe proceeds to instruct us that if the bees go so fast and so far as to pass beyond your sight and hearing, you will lose all right and property in them, and be reluctantly compelled to abandon the nomadic insects to whomsoever may secure them. It is not, unfortunately, quite clear whether this 'ancient Law of Christendome' may still be relied upon to-day, for many disputes have arisen on the subject in modern times, and evoked but vague and unsatisfactory decisions in the courts; but in a recent case a judge gave the bee-keeper's rights some favourable treatment by supporting the old-time dictum.

It is said by another old writer that, by one of the laws of Alfred the Great, all bee-keepers were bound to ring a bell when their bees were swarming, in order to give notice of the fact to their neighbours, and it is suggested that the old custom of beating on a pan with a key when the bees were 'up and busy in the swarm'—a rite religiously practised by the early apiarists, and still performed by some old-fashioned folks—served at least the useful purpose of acquainting their neighbours with the fact that bees were abroad with whom they had no right to intermeddle.

Even if the bee-keeper of to-day is, in fact, within his rights in traversing the premises of his neighbours, it may be assumed without doubt that he must not in so doing cause any damage to growing crops or to hedges and banks, for otherwise he will be mulcted in the pecuniary amount thereof.

III.

There are some quaintly subtle distinctions in the nomenclature of legal crimes and misdemeanours, and some interesting rules which are observed by the Courts. For instance, if you, being so unwise as to go off for the day and leave your house and all its treasures unguarded, should find on returning that your premises had been robbed, you would immediately cry, 'Burglars!' But the law, immune from your own natural excitement, would not call the depredators by that name, for the English legal system bestows the name of burglary only when a house is broken into (with intent to commit a felony) between the hours of 9 P.M. and 6 A.M.; at other hours—that is to say, roughly, in the day-time—the offence is 'house-breaking.' The Scots law manifests a justifiable impatience of such technicalities. To it, if a man breaks into your house with intent to steal, he is a burglar whether he comes at early morn, or dewy eve, or in the full glare of day; and the injured householder, lamenting the loss of his gold albert, will no doubt share in the feeling whole-heartedly.

Years ago the lawyers waged a battle-royal over the question of whether a suicide was chargeable with the crime of murder! Of course, the practical layman dismisses such hair-splitting with a contemptuous 'Pshaw!' but the study of law inculcates, indeed requires, a habit of close and accurate thinking, so that it is proper for practitioners to cultivate precision in their choice of terms. This academic question of 'suicide' or 'murder' was thrashed out with a great display of learning and eloquence till not an aspect of it had been neglected; but it was the non-existence of the person chargeable with murder that proved one of the stumbling-blocks in the way of those who pressed the claims of that crime. Nevertheless, suicide is regarded by the law as a form of murder, as we can see from the phrase *felo de se*—murderer of himself; but an attempt to commit suicide is not chargeable as attempted murder.

Then, whilst we are on this agreeable subject of murder, it is the practice in many coroner's courts never to permit a butcher to serve on

their juries, presumably because of the indifference to blood and violent death induced by that trade. No law appears to exist in support of such a practice, and it is probably the result of pure squeamishness on the part of the persons responsible for selecting the jury, a feeling which no doubt inspires due gratitude in the breast of the culprit.

That word 'culprit,' by the way, is a singular word, a word with a whole history in its form, and one whose associations carry us back to the time of the Norman Conquest. After the armies of William had subdued England, the Norman-French tongue was adopted by the educated classes, including, of course, the members of the legal profession; and when in course of time a mixed Anglo-French speech developed with the blending of victors and vanquished, it was duly adopted by the lawyers. Later still English, in a modified form, reasserted itself throughout the country and was used by everybody—except, in this case, the lawyers. These gentlemen presented an impenetrable front to the re-established native speech, and, amazing as it seems to present-day folk, persisted in the use, for the purposes of their profession, of the old Anglo-French, or, rather, of an extraordinary jargon of that order which they themselves coined, and which was utterly unintelligible to any one else. In this dialect the reports of legal proceedings were written, and hence arose our word 'culprit,' in a remarkably adventitious manner. There are two theories concerning the origin of the term, but the correct one is probably as follows. It is supposed that, after a prisoner had pleaded 'Not guilty,' the Clerk of the Crown replied, '*Culpable: prest d'averrer notre bille*,' which meant, in effect, 'He is guilty, and I am ready to prove it.' Now, it was the practice of the court-writers to enter up the records of the cases in abbreviated language, and this formula—being but a formula, and one which was repeated in thousands of cases—accordingly appeared on the rolls as 'cul. prist. &c.' The next link in the chain of circumstance was forged years later when the peculiar lawyers' language was forgotten, and these entries were mistaken for an appellation hurled at the accused.

Thus the word 'culprit' took its shape.

IV.

Fifty years ago there was a curious form of action called a 'suit of jactitation of marriage,' a mysterious term which clears a little when we remember that the Latin *jactitare* means 'to throw out publicly.' The suit served as a remedy to any person who was subjected to the annoyance of being reported by another party as having married him or her, and the offence was defined in the legal text-books as 'the maliciously posing or giving out by one party that he or she is married to another.' The person aggrieved sought his or her remedy by applying to the Court for a declaration of nullity and a decree putting the talkative one to a perpetual silence. This remedy is still available for present-day victims; but whether it has succeeded in deterring offenders or people have forgotten its existence, no suit of this kind has been instituted for many years, and the action may almost be regarded as obsolete. Still, it is quite within the bounds of possibility that some day a lawyer will surprise both judges and newspaper readers by unearthing the obsolescent form for the benefit of some suffering client, and then we shall see the Courts blowing the accumulated dust of years from their ponderous tomes to seek out the statutes and the cases bearing upon the subject. And perhaps an enterprising journalist, musing on the case, will write a tasty column for the edification of the curious, and moralise on the waxing and waning of legal forms, and their habit of waking from death-like trance to sudden life.

THE CABIN PASSENGER.

PART III.

VIII.

IF anything could have compensated Captain Keynes for the state of affairs on board, it would have been the weather. Day after day the wind blew out of the north-east, neither squally nor puffy, but with a steady decision that kept all sails drawing and the brig under full canvas pressing steadily south. Day after day the weather grew warmer and the sun's splendour more apparent. It was, as the captain expressed it, 'a bum voyage, and, for all the blanked seamanship you wanted, you might as well have lashed the helm and gone to sleep.' As a matter of fact, he did find some compensation in it. Fiery as he was, and implacable as he was said to be, it was not within his sailor's heart to watch his ship reeling off the knots without a certain satisfaction. Moreover, a rapid voyage promised a quicker end to his troubles, and a speedier revenge. He made no attempt to be anything more than civil to his guest, repulsing with a certain brusque sharpness any efforts to create a more genial feeling. He spoke little to the boxer, avoided his company as much as possible, and told himself that his time was coming.

But no fine weather and no rate of sailing could compensate the mate. With eyes sharpened by jealousy, he watched the growth of intimacy

between Mr Pickett and the captain's daughter. He was quite unable to account for it. He had never seen *Othello*, and, if he had, would not have seen anything in it. Yet Othello's was the method that Mr Pickett was unconsciously pursuing. It was, perhaps, too early for him to say with the Moor:

> She loved me for the dangers I had passed,
> And I loved her that she did pity them.

But, for all that, he found Miss Keynes quite ready to listen to the details of a series of prize-fights, and to thrill as he described 'the right hook to the jaw' that had settled one, and the 'kidney punch' that had terminated another. He also described with some warmth an unofficial scrap he had had with a Japanese professor of ju-jitsu who had nearly gouged out one of his eyes. It was one of his pet grievances; the grievance of a professor of one art confronted by another which poached on his preserves. 'The little snake!' he said warmly. 'Call that fighting! But I settled him. They took him home on a stretcher. I guess he's got all the bonzes in Japan praying right now that he doesn't meet me again.'

Miss Keynes smiled appreciatively. 'I guess he has,' she said demurely. 'I guess *any one* that's met you once won't want to meet you again.'

'I say,' said Mr Pickett, much hurt, 'you do say such things!'

'Any *man*,' answered Miss Keynes, tempering the harshness of her insinuation in her enjoyment of her power over him. 'Any *man*.'

'Ah, that's different,' replied Mr Pickett, more satisfied. 'Say, Phyllis—now don't get mad—what about that hitching?'

Miss Keynes surveyed him with her head thrown back and with a challenging smile. 'Oh, we needn't talk about that,' she said coolly. 'For one thing, my father would never consent to it.'

Mr Pickett appeared depressed. 'I can't think why your pop's so nasty to me,' he said wonderingly. 'I've been doing all I can to be nice to him, and the pesky little varmint—now don't get riled—your pop, I mean, don't seem to thaw a mite.'

'Well, you see,' said Miss Keynes judicially, 'different people have different ideas of niceness. I dare say he doesn't know that when you put him over your knee and smacked him, you were trying to be nice to him. His point of view wouldn't be the same as yours, you see.'

'Do you think, if I was to say that I was sorry I walloped him'—— began Mr Pickett.

'I don't think I should, if I were you,' said Miss Keynes with a faint smile. 'He mightn't like to be reminded of it.'

'Well, I don't know what else I can do,' said Mr Pickett despondently. He thought for a moment, and his face brightened. 'Unless'—— he said. 'Look here! When two men have fought it out—fought to a finish—they shake hands and are real good friends. Suppose I was to go off right now and give your pop a real good hammering—knock his clock right round—and then put my hand out and call it square—how would that do?'

'Oh, I don't think it would do at all,' said Miss Keynes, smiling in spite of herself at this generous proposal. 'And, besides, if it did succeed, if it really made pop friendly to you, you'd have to do with me next. I suppose you'd want to knock *my* clock round too?'

'No, I wouldn't,' said Mr Pickett, an unaccustomed tenderness creeping into his voice. 'No, I wouldn't.' He glanced at the girl as she leaned against the railing, her clear profile and dark curling hair rising and falling against the horizon. 'Do you know what I'd do to you?' he went on, leaning a little forward. 'Do you know what I'd do to you?' he repeated, his lips very near her cheek.

Miss Keynes jumped back from the railing. 'Oh, look!' she cried. 'What a big sea-gull!'

'Damn the sea-gull!' said Mr Pickett, pardonably annoyed. 'Confound the sea-gull! I was asking you a question. I wanted to know if you knew'——

'Oh, you want to know too much,' replied Miss Keynes with a merry laugh. She turned on her heel and made for the cabin. As she reached the door she threw a saucy glance over her shoulder and disappeared.

Mr Pickett smote his leg. 'I guess that gal is as slippery as an oiled eel,' he said. 'But I'm going to get my hooks on her before I've finished.'

He drew a long breath and looked about him. As his eyes travelled forward to the waist of the ship, he became aware that Mr Briggin was regarding him with no goodwill. Very slowly, and as though for his own gratification, he doubled his fist, admired it, drew up his right arm, felt his biceps, and punched an imaginary opponent. Then, greatly relieved, he strolled to the opposite side of the deck and ignored Mr Briggin's existence.

IX.

Mr Briggin nursed his wrath as best he was able; and it throve; and thriving, it became irrepressible. In two days it had reached the stage of vocal expostulation. On the afternoon of the second day he had to endure for a full hour the sight of Miss Keynes sitting on a deck-chair, whilst Mr Pickett stood before her and discoursed to her of further 'turn-ups.' He waited until the prize-fighter had left her, then took his place. 'Say, Miss Keynes,' said the mate, with what he meant to be admirable tact, 'what are you doing with that chap?'

Miss Keynes regarded him with a delicate affectation of surprise. 'I'm doing nothing with that chap,' she said mockingly.

'I guess your pop won't be pleased,' said Mr Briggin.

'He hasn't said anything to me,' retorted Miss Keynes.

Mr Briggin nodded ruefully. The captain's apparent complacence had been one of his most unpleasant surprises. 'If he hasn't said anything, he thinks the more,' he suggested.

'Perhaps he doesn't want to get smacked again,' said Miss Keynes with undutiful levity.

'He thinks the more,' repeated the mate firmly, 'and so do I.'

'You!' said Miss Keynes, tilting her chin. 'May I ask what have you to do with it?'

'Say now,' said the mate, much hurt, 'you ought to know by this time that I wouldn't think anything that wasn't for your good.'

'Oh, I'm much obliged to you, thank you,' answered Miss Keynes promptly. 'But you might as well know right here and now that I've only one poppa on board this ship. One's enough, thank you. I don't want any more. And you're not the one.'

'I don't want to be,' said the mate, reddening. 'And you know very well I don't want to be.'

'Well, then, why are you talking as if you were?' demanded Miss Keynes. 'Anything that wasn't for my good!' she mimicked. 'Just as if you were my poppa and I was your little girl!'

'I wish you *were* my little girl,' said Mr Briggin with much tenderness. He leaned forward. 'Say, why not *be* my little girl?'

Miss Keynes eyed him with calculating innocence. 'I don't see how I can be,' she said, 'as you didn't marry my mother.'

'It's that all-fired bruiser!' said Mr Briggin, starting back as though he had been stung. 'You never treated me like this before he came on board. And as for what you're doing with him'——

'And as for what I'm doing with him,' broke in Miss Keynes coolly, 'both poppa and you ought to be very much obliged to me for what I'm doing with him.'

'And what's that?' asked Mr Briggin slowly, his attention arrested.

Miss Keynes nodded her head impressively. 'Keeping him quiet,' she said. 'Keeping him quiet,' she repeated, after a pause. 'He was very angry with poppa—and very angry with you. You've seen the sort of man he is. Well, if it wasn't for me you wouldn't be having such a pleasant voyage. You'd have spent most of your time up the rigging, and poppa wouldn't have had a minute's peace. You neither of you know what he threatened to do with you. And just because I'm keeping him quiet, you come and scold me.'

'Do you mean to say'—— began the mate, puzzled.

'I mean just what I say,' answered Miss Keynes with dignity. 'I'm keeping the peace. And instead of thanking me, you round on me.'

Mr Briggin pondered with a gradually lightening mind. 'Say, Miss Lucy, you're a wonder!' he said at last. 'I hadn't thought of it in that way.'

'Men don't seem to think at all,' replied Miss Keynes, pressing her advantage. 'And after all the trouble I've taken'——

'Well, you won't have much more of it, at any rate,' said the mate, now thoroughly convinced. 'To-morrow we ought to raise Tahiti, and the day after we'll be in Papeete. And then—well, then that guy will have to look out for himself. Your pop's got it in for him.'

Miss Keynes looked up slowly, speculation in her eye.

The mate nodded. 'Got it in for him,' he repeated. 'Once we're berthed, I go ashore and fetch the gendarmes; and our passenger gentleman goes to clink for the mutinous hound of a seaman that he is.'

'Say,' said Miss Keynes, savouring the information slowly, 'that's a brain-wave for pop.'

'Oh, your pop's got brains,' replied the mate. 'He's kept it pretty dark, hasn't he?'

'He has,' admitted Miss Keynes. 'He never even told me. How do you know?'

'Because he told *me*,' said the mate triumphantly. 'So, when we get to Papeete, why, then you and me and your poppa gets a bit of our own back.'

'Yes,' agreed Miss Keynes; 'we get a bit of our own back.'

'Thought you'd be glad to know,' said the now thoroughly reassured mate. 'Well, so long! And when he's off the ship, then you and me will have another bit of a talk together.'

Miss Keynes smiled at him coquettishly. 'About me being your little girl?' she asked.

'Rather!' said Mr Briggin with a guffaw. 'Say, why not fix it up now?'

'I think,' said Miss Keynes pensively, 'that I'd rather wait until he *is* off the ship.'

'Oh, well, that won't be very long,' said the infatuated mate, nodding. 'I guess we'll talk of it then.' He walked forward, chuckling. 'Mrs Briggin!' he said, addressing the sea and the sky. 'Mrs Briggin! Dandy sound, hasn't it? "About being your little girl"!' he quoted rapturously. He turned suddenly, and beheld the cook at his elbow, grinning from ear to ear. He smote him on both, and pushed him into the galley

Aft on the poop Miss Keynes sat very still, her pretty forehead knotted in thought.

X.

On the following morning the lofty mountains of Tahiti showed above the horizon. In the late afternoon they closed with the land and ran down the coast towards Papeete. Mr Pickett had never yet beheld a tropical island. He stood beside Miss Keynes by the port railing, his eyes travelling over the land. The rugged mountain-slopes ran down to a belt of foliage,

thick with the leaves of the banana. Farther down the coco-nut palms thrust their graceful fronds to the sky, and a line of white breakers marked the reefs protecting the shore. The sun shone down brightly, illuminating a fair scene. All the poetry in Mr Pickett's nature bubbled to the surface, and it was with a rapt and somewhat dreamy air that he turned to his companion and spoke.

'Say,' he said lyrically, 'that's a pretty bum place, ain't it? Seems a kind of shame that a place like that belongs to a crew of naked savages. Sort of place where you and me ought to go ashore together. Guess I could call all the chiefs together, and knock their clocks round, and make 'em see reason. Then I'd be the big chief of the island—sort of king; and you'd be the queen, I guess. We'd make things hum.'

'If by naked savages you mean the French,' said Miss Keynes with a smile, 'you'd better not let them hear you. The island belongs to them. Your ideas are about a hundred years behind the times.'

'The French!' said Mr Pickett, somewhat crestfallen. 'Say, it's a pity we didn't come here a hundred years ago.'

'You'd probably have been eaten,' replied Miss Keynes coolly, 'unless they made up their minds you were too tough.'

'I'm no chicken,' said Mr Pickett proudly. 'I guess they'd have had to catch me before they cooked me. But what does your poppa expect to get here?'

'Copra, oil, fungus'—— began Miss Keynes promptly.

'Fungus?'

'The Chinks eat it back in Frisco,' explained Miss Keynes. 'It's a paying cargo. Then there's oranges'——

'Oranges!' said Mr Pickett tenderly. 'There'll be orange-blossom there, then?'

'Out of season,' replied Miss Keynes saucily. 'And, anyway, it's no use to us. It's the fruit we're after.'

'If your father was to get the fruit and you were to get the blossom,' suggested Mr Pickett, 'perhaps you'd both be pleased?'

'Perhaps we should and perhaps we shouldn't,' said Miss Keynes.

'And what am I going to get?' inquired Mr Pickett very tenderly, enfolding one of the damsel's tiny hands in his immense paw. 'What am I going to get—eh?'

Miss Keynes turned to gaze into the eyes that were gazing into hers. Her face was dreamy and abstracted. 'I'm not quite certain,' she said slowly and softly. She paused as a tiny smile flitted about the corners of her mouth. 'I'm not quite certain,' she repeated with even more softness; 'but I should say about six months!' she finished decidedly.

'Eh?' said the startled Mr Pickett, dropping her hand.

'About six months,' she repeated, nodding her head. 'Yes. I guess poppa's got it in for you. You don't suppose he's forgotten the way you took charge when you came aboard? Directly we draw up to the pier, poppa's going to send for the gendarmes. You'll be arrested, and charged with mutiny on the high seas. Six months! You'll be lucky to get off with that.'

'Will I?' cried the astonished Mr Pickett. 'And where do you suppose I'll be all the time? What do you suppose they'll say if I choose to raise a stink? There's an American Consul here, I guess. Where'll your pop be when I tell him how I've been doped and dragged on board his one-hoss brig—eh? I guess he'll have the whole United States sitting on his chest.'

'Don't shout,' said Miss Keynes coolly. 'Some one might hear you. And talk sense! How are you going to prove who you are? You're entered on the ship's books as Job Brown or Abel Jones or something—I don't know what. Pop isn't supposed to know who you are. You're just a seaman signed on with him. And you're a seaman who has mutinied. And when it comes to a bit of swearing between a ship's captain and a seaman, you'll know when you've been at sea as long as I have that the captain has the pull every time. You'll be in clink before you've time to say six words.'

Mr Pickett gazed at her, round-eyed. 'The little varmint!' he exclaimed. 'The little red-headed varmint! Say,' he went on, with reproach, 'I reckon you're in this little game?'

'I only heard of it yesterday,' answered Miss Keynes.

'Then who told you?' asked Mr Pickett. 'Your pop?'

'The mate,' replied Miss Keynes. 'Now don't get excited!' she continued rapidly as Mr Pickett clenched his fists and turned on his heels. 'Don't get excited, and don't you go looking either for poppa or the mate. You can't raise dust enough now to make any difference. You'll have the whole crew on you, and you'll be worse off when you get ashore. If you want to get out of this fix, you'll have to depend on me.'

'On you?' said Mr Pickett, staring. 'On you? Say, is that a cinch? Are you going to stand by me?'

'If you'll do what I tell you,' said Miss Keynes.

Mr Pickett stretched out a horny hand. 'It's a go!' he said. 'Put it there! I'm going to stand by for your orders.'

Miss Keynes took the outstretched hand, smiling a little shyly. 'I think you're very wise,' she said. 'Because, if you do,' she went on, with what Mr Pickett regarded as a wholly adorable hesitation, 'perhaps—later on—I may stand by for yours.'

'Gosh!' exclaimed Mr Pickett enthusiastically.

'Me for the orange-blossom every time. Now—right ahead! What am I to do?'

Miss Keynes knitted her forehead a moment. 'You've got to sprain your ankle,' she announced after a pause.

'Sprain my ankle!' exclaimed Mr Pickett in amazement. 'What good will that do?'

'Silly!' said Miss Keynes. 'You've got to *pretend* to sprain your ankle. You can slip going down the companion. You can't walk; you can only hop or limp. You can't stand. You've got to lie on board until they come to fetch you.'

'I don't see'—— began Mr Pickett, puzzled.

'You've got to trust me—altogether or not at all,' answered Miss Keynes. 'If you do, you'll do as I tell you. If you don't, we'd better call it off right away.'

'Altogether, then!' answered Mr Pickett heartily. 'When do I begin? I'll go and do it right now.'

'As soon as you like,' answered Miss Keynes. 'You'd better do it straight away. The mate's watching us. I can see him aft. Go and fall down the companion.'

Much astonished, Mr Pickett went off to obey his orders.

Mr Briggin, who had seen merely the conclusion of the interview, lounged forward. 'We shall hitch up alongside to-morrow morning,' he said carelessly. 'The skipper's going to heave-to outside the reef for the night. Too dark to get in.' His eyes travelled up the naked spurs of the mountain-side. 'That's Orohena,' he said appraisingly. 'Rummy sort of names these savages give their mountains. Now, if I'd had the naming of it, I'd likely have called it Mount Lucy, or Mount Mrs Briggin. But, then, I was always a bit poetical.'

THE ROMANCE OF DIVING.

By STUART MARTIN.

I.

NEXT summer will see the biggest salvage operations undertaken around the British Isles which have ever been organised in the history of salvage. Already the British Admiralty have marked out the location of over a thousand ships which were sent to the bottom by German submarines. D.21 is the official number of the chart which has been prepared, and it embraces the entire south coast of England and the east coast up to Yorkshire. On this map are little black dots which represent ships of from two hundred tons to ten thousand tons now lying on the ocean-bed. Before the end of the summer many of these ships will be raised, and will be hauled into dry dock to be repaired and refitted. All of these ships lie in water not more than a hundred and fifty feet deep.

From several of these ships divers have already brought up bullion to the value of many thousands of pounds, but in others it is the cargoes which represent the real wealth. The recovery of sunken treasure always appeals to the imagination of the landsman. To the diver romance is lost in the near approach of danger. Every diver knows when he goes down the rope-ladder that it needs but a very little thing to happen and he will never see daylight again. The sliced air-tube, entangled lines, the punctured suit, the possibility of being 'blown' to the surface, all these dangers drive romance from the diver's mind. It is not every man who can be a diver. Candidates are selected very carefully, whether for the Admiralty staffs or for salvage companies. Fat men are no use; there must be no cardiac disease, no constitutional complaint, no history of fits, no varicose veins, and no smoking or drinking to excess. For deep-sea diving, men over forty-five years are very seldom employed. Consider that the weight of an ordinary apparatus is about one hundred and seventy-five pounds; a forty-pound lead weight is hung on the chest, and another on the back; and sixteen pounds of lead are fixed to the brass sole of each boot. Generally the diver carries a knife in a sheath at his side, and it is to this small dagger that many owe their lives.

One of the most famous divers of recent times was Alexander Lambert, a man of iron nerve and tremendous courage, whose record is full of triumphs over almost unsurmountable difficulties. On one occasion he was engaged in fixing copper sheets to a coal-hulk off Diego Garcia, in the Indian Ocean, and for several days in succession a shark visited him at work, and hung around waiting for a chance to make a rush. Each day it ventured nearer. Lambert, by opening his air-valve, frightened it off once or twice. It soon got used, however, to the swirl of escaping air, and after a few days refused to take any notice of it, but waited, eyeing the diver all the time. Lambert determined to rid himself of the intruder, and one morning, when he went down and the shark arrived as usual, he signalled to his attendant for a large knife and a rope with a noose. These were lowered from the boat above, and down in the gloom of the ocean-bed a grim drama was swiftly played.

The diver held out his bare hand as a bait to the shark. The monster moved forward, slowly at first, then turned on its back for the attack. Its great jaws opened. Quick as thought, Lambert withdrew his hand, plunged his knife

several times into the white belly, passed the noose round the shark's body, and signalled to the attendants to haul it up. It was dragged to the surface, struggling and fighting; and Lambert returned to his work.

The most dangerous foe encountered in the ocean depths is the octopus. If this horrible creature once gets its tentacles fastened on a diver's suit, it seldom lets go until it is killed. There are cases on record where the struggle has terminated only when both diver and octopus have been hauled to the deck of the salvage-boat locked together. Captain Gardiner, of the American Salvage Company, was once working at a wreck, when he was horrified to see the long arm of an octopus waving in the water near him. The remainder of the creature was hidden in a dark cavern. Gardiner waited until the slimy horror had crawled into its resting-place, and then he signalled hastily for a charge of dynamite to be sent down. This he laid at the entrance to the hole and blew the octopus to pieces.

When the same diver was at work on another occasion a thirty-foot beam fell across his life-line and air-pipe, blocking all way of escape. With great coolness Gardiner cut both life-line and air-pipe, holding the end of the latter between his fingers until his suit was filled with air, when he floated to the surface. He was for ten minutes with his fingers pressing the air-pipe before he reached the top.

Then there is the case of the diver Pearce, who some years ago was helping to salve bales of cotton from the s.s. *London*. A chain, at the end of which were four large, sharp-pointed hooks, was lowered to him, and Pearce's work was to fix the hooks into the bales, which were then hauled up. After fixing one of the bales, Pearce signalled to the attendants to try whether the strain would hold. While he was feeling with his hand to ascertain if the bale had started, the hooks gave way, and tearing through the packing, one of them pierced his hand through the palm. Being unable to signal, he was dragged in this excruciating state from the bottom of the hold to the upper deck, where he collapsed.

II.

Perhaps the most prominent instance of salving specie was the recovery of ninety thousand pounds sterling from the *Alphonso XII.*, which sank off Point Gando, in the Grand Canary. The ship lay under one hundred and sixty-five feet of water, and besides the great depth, there were bad weather conditions to contend with. The pressure of water was seventy pounds to the square inch—enough to crush the life out of a man but for the resistance of the air in his suit. Lambert, whose name has already been mentioned, was the diver engaged to search for the specie. He blasted his way through decks, doors, and two saloons, and great was the excitement when the chief of the expedition sent home a cable: 'Lambert has got both scuttles open and got into the magazines. The boxes of gold are there.'

It was Lambert also who saved the situation when the Severn tunnel was flooded some years ago. A door in the drainage-tunnel had been inadvertently left open. The door was a quarter of a mile from the shaft, in which the water had risen about forty feet. Lambert went down, and began to creep through the narrow passage. Débris floated thick in the flooded tunnel, but with rare coolness and courage he crawled among the wreckage for that long and dangerous quarter-mile, and succeeded in closing the doors. It was owing to this daring act that the pumps were able to overcome the water, and the work of completing the tunnel proceeded.

Another case of salvage of specie was that of the s.s. *Skyro*, which sank off Cape Finisterre in 1891, with ten thousand pounds worth of silver bar and a valuable cargo on board. Although an expedition was sent out the same year, it was not until six summers afterwards that the specie was raised, and that entirely owing to the pluck of a Spanish diver named A. Erostarbe. The depth at which the diver worked was never less than one hundred and seventy feet, and he had to use dynamite to get to the bullion. During the time she had been in the water the deck of the ship had collapsed to within a few inches of the cabin floor, and when Erostarbe finished his work there was no part of the wreck standing higher than himself, except the engines and the boilers; it was just a heap of scrap-iron.

In the wreck of the *Hamilla Mitchell*, which was lost on the Leuconna Rock, near Shanghai, with specie valued at fifty thousand pounds, the divers had a narrow escape from pirates. Lloyd's agent, on the instructions of the underwriters, visited the wreck, but reported that he considered the cargo and the treasure irrecoverably lost, as the depth of water was so great (one hundred and fifty feet) and the position too dangerous. Nevertheless, salvage-work was undertaken by Captain Lodge, who consulted Siebe, Gorman, and Co. as to the gear he would require, and with suitable apparatus left England along with two Liverpool divers, Messrs R. Ridyard and W. Penk. The search for the wreck lasted some time among the rocks, and it was discovered that the ship had broken in two, the afterpart, containing the treasure, having rolled into deep water. Ridyard, after considerable difficulty, got to the specie-room, and found most of the coins lying in heaps, the worms having eaten the wooden boxes so that they were riddled with holes. Four successful trips were made, and then, as Ridyard felt thirsty with his exertions, Penk volunteered to go to the top of the island and fetch some cool spring water. As he filled the bucket he saw about a hundred sailing-boats coming from the mainland in their direction;

and when he reported this to Captain Lodge, the latter identified them as piratical junks. The Chinese had heard of the treasure, and had come to rob the men who were risking their lives for it. Orders were given to slip anchor and chain, but as the junks came nearer the wind went down, and the three treasure-seekers took to the oars. Ridyard was already in an exhausted state, yet he took his spell at the oar for some time, till suddenly the wind sprang up. They set sail quickly, but the pirates kept up the chase till night came on, and then, under cover of the darkness, the Englishmen made Shanghai safely with their valuable cargo of bullion, amounting to forty thousand pounds. The balance was recovered later.

III.

No man can count the millions of pounds sterling that have been recovered from the sea by divers. They have done valuable work, too, in building harbours, cleaning and repairing shattered keels and propellers, destroying dangerous wrecks, and blowing up submarine rocks. Every ship in the British navy has her complement of divers. Not long ago the Admiralty recompensed J. P. Lingan of the sloop-of-war *Shearwater* for saving that ship from a grave off the coast of Mexico. In 1912 the *Shearwater* was cruising in Mexican waters, when a gale swooped down and tore a propeller from its shaft. Resort was immediately had to the sails, but it was found that steering was almost impossible because the big arch, or well, under the stern in which the propeller had revolved made the rudder's work ineffective. The officers saw that if they were to bring the ship to port this well must be boarded up. Lingan was sent down to do the work.

Though hampered with a heavy diving-suit and by the weight of water, he was able to adjust himself to the bad rolling of the ship and handle the heavy timbers passed to him. He fastened the boards so securely that they could be shifted in only one place when the *Shearwater* reached port, even though she had been battered by heavy seas on the way.

But that was not all. When Lingan was working in that cramped position under water, crouching in a narrow tunnel with the green waves trying to suck him out, sharks were prowling round the ship's stern watching him hungrily, ready for him if he slipped off his perilous foothold. At times they came quite close, as if they knew he was already theirs and desired to wait no longer. They would have plucked him from that archway as an urchin picks a whelk from its shell, but just above him stood a guard of armed men, who aimed and fired and aimed again at the dark fins flashing through the heavy waves. That is but an instance of one of hundreds of ships which have been able to trail their wounded sides to port because divers have bound together the gaping holes in their timbers till they were dry-docked.

And all these vessels were saved, and all the treasure was lifted from the sea, and all modern docks and harbours have been built on solid foundations because one man sat down in his study at the beginning of the nineteenth century and pondered how mankind could live unharmed in water. That man was Augustus Siebe, who invented the first diving-apparatus of lasting service in 1819. It was an 'open' dress, and was worked in conjunction with an air-force pipe. It consisted of a metal helmet and shoulder-plate attached to a water-tight jacket, under which was worn a close-fitting combination-suit. Although good work was done in this dress, a diver could not bend or crawl much while wearing it. If he fell, the water filled his dress, and unless quickly hauled up he was in danger of drowning. After many experiments Siebe introduced, in 1837, his 'close' dress, which, with improvements, remains that now universally worn.

It is interesting to watch a diver being dressed. First he removes his own clothes, and puts on a great quantity of warm underclothing—guernseys, long stockings reaching over the knees, and in some cases a woollen cap. These are all needed because of the cold experienced at great depths. Then a shoulder-pad is put on, and the attendants wriggle the diver into the rubber suit. Outside stockings and a canvas overall are added to protect the dress, and then the helmet is screwed on. When the diver has stepped over the boat's side, two men are told off to man the pump and look to the 'lines.' A tap on the helmet signifies that all is ready, and the diver waves his hand and sinks slowly out of sight.

Round each man's waist is a life-line, inside which are the telephone-wires; a mouthpiece is fixed inside the helmet. The signal code is still in force, however, and is in use almost as much as the telephone. It is possible, indeed, for the attendants in the boat to put two divers in communication with each other by simply turning a switch, the conversation being carried on through the tiny telephone 'exchange' above; and constant communication is kept up between the divers and the men above, who are always on the alert for signals. One pull on the breast-rope signifies 'Are you all right?' An answering pull from the diver means 'Yes;' but if the pull is given on the air-pipe by the attendant, it means 'Search (or remain) where you are.' On the other hand, if the diver pulls the air-pipe once he wants 'less air.' The person receiving the signal repeats it to show that he has understood; and the signal which sends a thrill through every 'tender' is four pulls on the air-pipe. It means 'Haul me up,' and no diver ever gives these four pulls unless something has gone seriously wrong.

The greater the depth to which a diver sinks means the greater the pressure, and it is reckoned

that no man can safely work under more than a hundred and fifty feet of water. For instance, the divers on the *Oceana*, which was wrecked in 1912 off Folkestone, and from which £747,000 of bullion was recovered, had a pressure on their suits of nearly forty pounds to the square inch; but Admiralty divers—who are the most scientific in the world—have sounded two hundred and ten feet. At that depth the pressure is about ninety pounds to the square inch, and there is also the fact to be reckoned with that the deeper a man goes the less daylight is available. Water-tight electric-lamps have been devised, but even with their aid it is difficult to see more than a few feet in the sea, and consequently the men work more by instinct than sight. The electric-lamp, moreover, is a great attraction to fish of all kinds, which swarm round the divers' helmets, peering with startled eyes at the strange intruders into their world.

In some waters these fish become such a nuisance that divers eject paraffin-oil into the water round the lamp—and if there is anything a fish detests, it is paraffin-oil.

THE STRANGE CASE OF THE MISSING BANKER.

TO some persons the ultimate solution of a mystery is much more interesting than the mystery itself. To others a mystery which is never cleared up presents the greater interest. It is to the latter class of persons that the following story will appeal. It is a tale taken from real life, and, as we shall see, one which has been told and sifted in the law courts on more than one occasion. But neither judges nor any other persons interested in the case have been able to arrive at a definite conclusion as to what really happened.

On 10th February 1892 there appeared in the obituary column of the *Standard* the following notice:

'LIDDERDALE.—On 30th January, on Miss B. A. H. Vining's yacht *Foresight*, William Robertson Lidderdale, of Ilminster, the result of an accident on 8th January, alighting from a carriage when in motion.'

Although unusual, there is nothing particularly mysterious about the above notice, and yet it is a link in a very strange chain of circumstances.

William Robertson Lidderdale was the manager at Ilminster of an important branch bank, and had occupied that position for a considerable number of years. He was in easy circumstances, and a person of good repute in the town. He was an officer in the local Volunteer Corps, this being before the days of the Territorial Force. He was engaged to be married to a well-known young lady in Ilminster, and the wedding had been arranged to take place on 14th January 1892. Lidderdale had known the lady for some years, and there seems to be no reason to doubt that he was deeply attached to her.

On the 8th of January Lidderdale drew £1020 in notes from his own bank-account, and proceeded to London to meet a solicitor in connection with the purchase of some property on behalf of a client. It would appear that he had arranged to meet the solicitor in the railway hotel at Paddington, and he was seen to enter that hotel. For some unexplained reason, the solicitor did not keep the appointment. Lidderdale was seen to leave the hotel, and from that moment *he completely disappeared.*

On the day after that on which Lidderdale left Ilminster, his fiancée received a letter from him saying that he had arrived safely in London, and that 'the first person I met on the platform was Miss Vining.' He went on to say: 'Her old lover is dead. I was soon told what she wanted, and got rid of her.'

Now, who and what was Miss Vining?

Lidderdale used to tell his friends that, happening one day to be in the railway-station at Bath, he saw a lady struggling to open a railway-carriage door which had got jammed. He opened the door for her and assisted her to alight. Later, as a carriage drove past him in the streets of Bath, the hat of a lady who occupied the carriage was blown off. Lidderdale picked it up and restored it to her, and, to his surprise, she turned out to be the heroine of the station incident. The recognition was mutual, and the lady either introduced Lidderdale then and there to her mother, who was in the carriage with her, or took him home with her and effected the introduction. In any case, Lidderdale soon found himself on a footing of friendship with the ladies, which later developed—at least so he said—into a warm attachment to himself on the part of the daughter.

According to Lidderdale's story, Miss Beatrice Vining—for that was her name—was a wealthy Spanish creole, who was said to be possessed of a house in Bath, a flat in Westminster, a carriage, and horses. Subsequently she acquired a yacht, and named it *Foresight*, in honour of Lidderdale—that word being the motto of his family. Lidderdale used to relate that he visited Miss Vining and her mother at Westgate, and although no yacht of the name *Foresight* appeared in Lloyd's Register, yet it was stated in court that a coastguard had been found who said he remembered seeing such a yacht at Westgate about the time Lidderdale was supposed to have visited Miss Vining and her mother. But this

does not seem to have been confirmed in any way.

Lidderdale stated to his friends that Miss Vining was most anxious that he should marry her—their association appears to have been quite an innocent one, and the mother seems always to have been in the background—but by this time he was engaged to the Ilminster lady, and apparently had no desire to marry Miss Vining.

After his disappearance, Lidderdale's friends inserted urgent advertisements in the press, appealing to Miss Vining to come forward and give information regarding his death, but with no avail. Miss Vining and Lidderdale—save for one subsequent incident—utterly and entirely disappeared, never to be heard of again.

Just once was the veil slightly raised. Some time after the disappearance Lidderdale's fiancée received a package, addressed in unknown feminine handwriting, containing a Jubilee sixpence and a Christmas card she had given to Lidderdale (the Christmas card being in the form of a cheque drawn on the 'Bank of Love'), £500 in bank-notes, and some of Miss Vining's visiting-cards *with the address cut off*. On one of the cards was written, in what was then thought to be Lidderdale's handwriting, the words, 'Was true to you.' And that was the last that was ever heard of Lidderdale.

The whole circumstances ultimately came to be investigated in the Probate Court in connection with the winding-up of Lidderdale's affairs, and an application was made for 'presumption of death.' The case was adjourned time after time in the hope that some further light might be obtained, but, so far as the writer knows, the matter still stands where it did.

Incidentally, at one hearing of the case—in 1918—a book named *Lost for Love* was produced. This book was said to have been given by Lidderdale to his sister. On the title-page was written Miss Vining's name in Lidderdale's handwriting, and also his name in what he had told his sister was Miss Vining's handwriting.

What we do not know is whether or not Miss Vining ever existed at all. Was she a mere myth, a figment of Lidderdale's imagination, originally invented by him to humour his own vanity, and elaborated to support the invention and to satisfy the curiosity of the friends to whom he had described her? It is true that he used to show Miss Vining's photograph—or what he said was her photograph—to his friends, but none of them ever saw her in person. Indeed, no one could be produced who had seen either her or her mother, and careful investigation and diligent search in connection with the legal proceedings failed to trace the house in Bath, the flat in Westminster, the yacht, or the carriage and horses.

Yet on the 8th of January 1892, six days before his wedding, the man walked out of the life he had been leading and in which he was popular and respected, gave up the woman he was engaged to and to whom he appeared devoted, abandoned his position, his money, and his friends. And why? Nearly thirty years have passed, and no one has been able to answer the question. There was no suggestion of insanity, and it is unlikely that he was decoyed and murdered, in view of the receipt of the packet sent to his fiancée.

At the time of Lidderdale's disappearance it was stated that a Miss Vining—but Julia and not Beatrice—had also disappeared from her home. She was of humble origin, but of attractive appearance and well educated. Her home was in a small town in which Lidderdale had worked as a bank-clerk before going to Ilminster. But no evidence was ever actually produced to show that Lidderdale knew her—although, as the town was a small one, he probably did—nor was it ever shown that she and Lidderdale had corresponded or kept in touch with each other.

In fact, up to date, the story ends with the notice in the *Standard* and the receipt of the packet of bank-notes, &c., and we are left to speculate as to what was the real explanation of the disappearance of 'The Missing Banker.'

THE SONG-MAKER.

I.

Out of my dreams of old,
Out of my dreams I'll mould
Cloud shapes of beauty untold,
I'll weave me a passing song.

II.

From the measured tread of the years
And their sad abyss of tears,
From the night's gray haunt of fears,
I'll fashion a passing song.

III.

In a silence and idle dreaming
When the summer the earth's redeeming,
O there's nothing so real as seeming
To make but a passing song!

IV.

I'll fashion a goblet for sorrow
Where grief may lie hid on the morrow;
A chaplet of joy I'll borrow
To make but a passing song.

V.

Out of pain and its ache of heart,
Out of pleasure which none may part,
With a never-wearying art
I'll sing me a passing song.

VI.

Comes night with her dusky embraces
In star-woven, desolate places,
Where cloud with rolling cloud races,
And blowing winds speed home-along.

VII.

By the cooling voice of a stream
As it flows with a silvery gleam,
Enclosed in an exquisite dream
Then fashioned shall be my song.

AFTER GRAYLING IN PERTHSHIRE.

By RONALD M. LYELL.

THERE is a river in Perthshire, not unknown to anglers, whose lower reaches remind one of a typical south-country chalk-stream rather than of the mountain-torrents of Scotland. It presents a complete contrast to the mighty river whose tributary it is, for its banks are neither rocky nor formed of gravel, but sedge-lined, and they slope down so abruptly from the brink that wading is out of the question. So sluggish is the current that a stranger to the place might easily be at a loss to tell the direction of its flow; it appears more like a canal than a river. There are no broken shallows to catch the eye, no projecting rocks to harbour lusty trout or to create swirling eddies. The river keeps the same even tenor of its course throughout, either when its surface is lashed into miniature waves by the keen wind that blows down its valley from the north, or when the surface is undisturbed by any breeze.

Though forbidding of aspect to the angler's eye, and lacking those distinctive details which he knows so well, this stream has few rivals in the north—or south of the Tweed, for that matter—in the heavy weight of the fish it breeds. Grayling they are, it is true, and the grayling is a fish which in Scotland is not appreciated at its true value. Their presence in the river at all calls for some comment. They are not native fish, but were introduced in a misguided but well-intentioned attempt to rear trout and grayling side by side for the purpose of providing the angler with sport the whole year round. That success was possible is proved by the rivers of Yorkshire, where trout and grayling thrive in the same streams, but it is well to remember that more winter grayling-fishing is done on these same streams than anywhere else in the British Isles. When, owing to the war, the number of winter grayling-fishers decreased, the grayling immediately began to oust from their place the trout native to the river.

In the venture on this Perthshire stream little or no account was taken of the prolific breeding of the grayling. They found the stream to their liking, and, settling down, throve so heartily that the trout, once the lords of that region, were forced completely into the background, the capture of one in a day's fishing being almost a rarity. If the grayling had been keenly sought for by rod and line during the winter months all would have been well; as it is, they are complete masters in the river.

But as grayling-fishing was our intention, it was with no misgivings that we set out in the late afternoon one summer day to test upon that river, for the first time, the deadliness of the dry-fly. The day had been warm, with a strong wind, which kept driving large, fleecy clouds across the sky. Towards afternoon the wind began to abate, and by six o'clock it had dropped completely.

We arrived at the high stone bridge some two hundred yards above the junction of the stream with its mighty parent river, and, while fitting up our rod and attaching to the thin, level line a two-yard tapered cast, intently surveyed the portion that lay up-stream.

There was no breath of wind, and the river was undisturbed by any ripple, while the trees on the opposite bank were distinctly mirrored on the glassy surface. The only signs of life were the swallows that wheeled and dived in the pursuit of their insect food. Far up-stream a fish rose once, twice; the spell was broken, and we hurried along the right bank in the direction of the rings that were rapidly spreading towards the sides.

On arrival at the spot it was found that the insects on the water were small specimens of a dun, of which the Red Quill seemed an approximate representation. A Red Quill was attached to a 4 × gut point, and, after a dip in paraffin, was despatched to the fish, who promptly refused it, and gave up rising altogether.

As the whole of the long summer evening still lay before us, it was decided to walk farther up-stream, and to spot any rising fish on our way. The first rise was not seen till nearly ten minutes past seven, when a good fish put up his head close to our own bank. As he was lying in a little bay between two bunches of rushes, the cast was by no means easy, and four attempts were made before the fly could be brought to the fish's notice. When it was observed, he took it down very quietly.

Those deprecators of the grayling who state with Charles Cotton that the grayling is 'the deadest-hearted of all fishes' would have had

 [*All Rights Reserved.*]

their eyes opened by the behavour of this particular fish. It fought for its liberty as fiercely as any trout, and just as we were congratulating ourselves upon foiling its wily tactics, and were towing it upon its side to the bank, in apparently utter exhaustion, it gave one final plunge, and the hook came away.

Our thoughts were soon diverted from this reverse by the appearance of a swarm of ants, and a few fish began to feed, not hastily, but with that steady attention to business that the angler rejoices to see, knowing as he does that it is the surest indication of a heavy basket. A Red Ant was substituted for the Quill, and a fish was risen at the very first cast. All went well this time, and after a spirited struggle, in which a bed of weeds played no small part, a shapely grayling of a pound and two ounces was brought to bank. On examination his gullet was found to contain several ants, a discovery which fully confirmed our determination to stick to the pattern we had mounted, the more so since three fine fish fell victims to its charms in rapid succession, weighing 1 lb. 9 oz., 1 lb. 13 oz., and 2 lb. respectively. It was a peculiar fact that though two-pound fish were by no means a rarity, yet we never, on this or any other visit to this stretch, succeeded in catching a grayling of greater weight.

A fish, which looked well worthy of our attentions, was next seen to rise above a partially submerged log some little distance up-stream. A long cast put the fly directly over him, and he accepted it without hesitation. But it often happens that the fish which seem to expect no guile are the most desperate when hooked, and this grayling was no exception. Before we were properly alive to the situation he had dived under the log, and the cast came back to us, minus the fly and the gut point.

By the time this damage had been repaired the fish had given up their diet of ants, and were rising, with lavish display of azure back-fin or broad tails, to some minute object apparently lying flat on the surface. The Red Quill was put over several fine fish without effect, and, baffled for the moment, we gave up casting and studied the movements of the fish. Then it occurred to us that the fish were feeding upon spinners, or duns, which, their life's mission of laying eggs accomplished, were floating exhausted down-stream with wings spread flat upon the surface. The sun had set, and detection of the species was almost impossible; but we decided to chance it, and fastened to the cast a copy of the female Sherry-Spinner, the imago of the Blue-Winged Olive. With this pattern, however, no sport was found; though several fish came up for a look, on closer inspection they retired with disdain.

As a last resort, we cut off the spinner, and put on instead the rough imitation of a nymph at the moment of breaking its nymphal casing and emerging as a complete subimago. The imitation's body was of yellow silk, dubbed with light fur from the hare's ear, and a short pale-blue feather from the underside of the waterhen's wing was the means of representing the insect's legs. As this feather's fibres are soft and pliable, they are easily agitated by their passage through the water, and represent effectively the swimming motions of the nymph. The pattern succeeded beyond our wildest expectations. Two fish were killed, each over a pound and a half, and another two-pounder as well.

Darkness had now set in, and it was only possible to see indistinctly the rings made by rising fish. The cast had often to be made in the direction of the sound, and it was in this way that a third two-pounder was lured to his fate, together with a smaller fish of 1 lb. 7 oz.

We slowly retraced our steps in the direction of the stone bridge, and had reached the spot where the first fish was hooked and lost, when there came from the tiny bay the sound of a great splash. As we had not yet taken down the rod, a cast was made at random in the direction of the sound, and at the second attempt a slight pull was felt. A quick, but not too violent, response on our part was answered by a tremendous rush, which nearly emptied the reel, and, in the darkness, the sound of a heavy fish jumping was heard from the middle of the river. Silence followed, broken only by the whir of the reel. The fish was no grayling—of that we were quite certain; and after an agonising contest, a massive silvery form came into view, only to sheer out again at sight of us. At length the fight came to an end, and a magnificent trout of two pounds and a quarter was landed on the grass, and triumphantly knocked on the head. This act led to the disgorging by the trout of seven small salmon parr, evidently just devoured before seizing our nymph, which was so securely fastened to his jaw that we deemed it advisable to break the gut rather than waste time in attempting to unhook the fish, for the gut itself was very nearly chafed through with the rubbing it had undergone in the course of the struggle. The fish was then laid in regal state on top of the grayling in the creel, and we made our way joyfully to our bicycle at the bridge.

Though we have fished that river again, and succeeded in capturing good baskets of thymallus, yet never has it been our fortune to take from it another trout to rival the memorable fish which fell a victim to the nymph on that eventful summer evening after set of sun.

IN SELF-DEFENCE.

By 'R.E.,' Author of *The Infra Red Rag.*

I.

GRANT HASWELL came into mess and flung himself into the first deck-chair, frowning.

After a curt good-morning to Lloyd-Jones and me, he lay there pulling vigorously at his short bull-dog pipe and looking up at the roof of the veranda.

It was just 6.45 A.M., or about an hour after sunrise in that part of the world, for we were in Walindi, German East Africa, and near enough to the equator to make the day almost exactly twelve hours long. We were on the coast, too, and in the middle of the rains, which made it hot, moist, malarial, and irritating.

I was surprised to see Haswell about so early. The day before he had come in from the interior, 160 miles over terrible roads, in a Ford car. By using twisted bark ropes on the wheels as non-skids, he had managed to reach Walindi from Bomatua, arriving, fagged out, late the same night.

I noticed that as one of the Swahili 'boys' came in to lay the table for breakfast Haswell dropped his eyes from the roof for an instant, and muttered a word in Swahili which seemed very like a reproach.

It was not till we were all at breakfast that he gave us any clue as to the reason for his quite unusually taciturn behaviour earlier in the morning.

Then he treated us to an outburst of bitterness against some person unknown, who, during the previous night, had stolen from his tent—nay, more, from his very bed-head—a uniform-case containing some things he evidently valued very highly; and by the time he had finished everybody was about 'fed up' with uniform-cases that got stolen, A.P.M.'s who didn't do their job, M.P. who knew nothing of the natives, and undesirable sites for the tents of officers staying casually in Walindi.

Later in the morning I met him near the *Msoko* (bazaar), watching some highly scented fish being sold. His dress little resembled that of an officer in His Majesty's Service. Knowing Haswell as I did, it seemed unlikely to me that he was there as an idle sightseer, and I was convinced I should hear something interesting if, on the way home, I could get him to talk of his morning's walk; for he had motioned to me, ever so slightly, to turn down a narrow street behind where I stood, and wait for him.

A few moments later he joined me, and as we walked along began to talk in his usual jocular, if slightly cynical, way about the progress of the chase of Von Lettow.

As we passed an Arab house with whitewashed pillars supporting a solid flat stone roof, Haswell remarked, 'I see that old swine, Hadji Mousa, is still here, and I'll bet the old blackguard is making some "chips" out of the expedition in one way or another. I wonder if he is engineering these daily thefts of kit, &c., amongst other things.'

Just then a gray-bearded, patriarchal old man appeared, dressed in a white, embroidered *kanzu*, and wearing a green turban. He advanced towards us with his eyes shaded by his two delicate brown hands, and greeted Haswell, 'Salaams, master. It is a long time since we last met, and I hope that God has given you health and riches during these many days of the war.'

'Thank you, Hadji,' replied my companion; 'could I not see the one and be certain of the other, I should say the same to you.' Then he added, 'I shall come to see you after the hour of evening prayer, Hadji.'

'Good!' said the old man, again raising his hands to his forehead.

As we went along I was going to ask Haswell if he was doing anything about his lost uniform-case, when he began of his own accord. 'Glad those niggers pinched my kit last night, old thing. The O.C. tells me I shall be here a week or more.'

'You're glad? You didn't seem so this morning,' I replied. 'Why, Lloyd-Jones said the A.P.M. told him he suspected it was done by white men.'

'Did he? Well, I guess that's another reason why I think it's niggers,' he laughed.

'What are you going to do about it? Or, rather, what have you done?'

'Been to Ordnance and bought this outfit, for one thing.'

'It's certainly some kit,' I said, looking at his Tommy's slacks and *pugaree* shirt without rank-badges.

'Good enough, till I get mine back. Besides, it's inconspicuous to go about in, and cuts out salutes. Oh! I visited the nigger graveyard too,' he added, looking more serious. 'Nothing much there, except two rather interesting graves, dug last night and filled in this morning early. I suspected them both—that's why my cane is muddy—but the contents were soft all right.'

'Has that anything to do with your kit?' I asked.

'Well, it might have had, but instead I learned only that the natives are more careless about their *kaburi* than they used to be. The customary depth of a grave was the height of a man's shoulder from the ground, but I expect

they are getting tired of digging so deep since the expedition came on the *shauri ya vita* [war palaver] and gave them extra work in that direction.'

'They are not keen on work,' I agreed.

'No; the M.L.C. officers haven't all got quite the right idea about native labour as my old friends knew it, but I suppose the Government want to placate the people here, and have given some orders about it. Pity to spoil these Swahili with too much "brother" nonsense, though; the Boche had them nicely tame. A nigger likes a man to be a man; respects and loves him for it, even if there's been pain for himself in the learning. Look how they've stuck to old Von Lettow.'

'They have, beyond a doubt. But what about your kit?' I said, fearing that he would go on with his pet subject, the native question, and I should miss something interesting in the detective line.

'Well,' he answered, 'having clothed myself and visited the graveyard, I strolled about the shops, and eventually came to the market, where there is always a fine crowd in its best togs. There was a chance they'd let a bit of my stuff loose in the night, and I'd have recognised it if anybody was wearing it. Still, I hardly expect to see any about yet.'

'Why?'

'Because it was taken just before daybreak, by natives, probably three of them, and they wouldn't want to waste time breaking open the lock then. That gave me another clue. The box isn't far off—it was too heavy even for three men to run with.'

'Suppose you're right about the time they relieved you?'

'Yes, I'm certain it was about 5 A.M., as it was raining till then. The *spoor* had been made after the rain.'

'There was *spoor*, was there?'

'Yes, but not of much value, as I slept so late. I lost it in a porters' track about ten yards away. It gave me the direction—towards the graveyard—but not much more.'

'And you went to the A.P.M.'

'Yes,' laughed Haswell; 'we're in the army now, old thing, and must do certain things in certain ways.'

'And he said it was white men?'

'Yes; but I got him to say it might be either before I left, without telling him I *knew* it was niggers—which showed me that he would jump to any conclusion from hour to hour, and, in fact, that he was no use to me.

'What will he do?'

'Well, he agreed to tell all the Indian traders to report to him if anybody tried to sell any stuff as per my list of lost articles; also to instruct his native police to arrest anybody found wearing articles supposed to be mine. Considering the amount of white men's kit the local nigger has now (proceeds of thefts, presents, &c.), the last proposal doesn't seem too intelligent; *I* made the first for the sake of saying something.'

'There are plenty of these thefts here—officers' kits mainly.'

'Yes. The A.P.M. told me they are never found either. There are often as many as three cases in a week, it appears.'

'There are at least. Yet you hope to get yours back?'

'Well, Africa is a big continent, and a nigger thief is one of the hardest to catch. If I spot the right crowd before they can get the case out of the town, it'll be easy to force them to show me the *cache*. On the other hand, if they try to get away, it'll be easier, for I have some reliable "boys" watching the pier and the roads out of the town. I myself am doing what I can in the town proper.'

'You seem very cheery about it, though I thought the stuff you have lost was valuable.'

'It was—papers relating to investments, photographs, letters from my fiancée, kit, and so forth. Still, the chances of a capture are good, I think, looked at either way. Suppose, for instance, some native has recognised me as an old hand, as Hadji Mousa did, the news will get out, and my stuff will be kept buried where it is in the town; the more so, as they will at once spot me looking about all day. Perhaps at night they might try to get out a few things at a time, but they daren't shift the lot whilst I am in the town, or allow the clothing to be seen in the streets. On the other hand, if they think me a new-comer, they will not bother to shift the case out of the town, and will gradually sell the contents to natives leaving for up-country or by sea, after waiting a few days till the hue-and-cry has stopped. This seems most likely, as I have done the usual in getting the native police on the job. Some of these gentlemen are probably accomplices themselves. To meet either case, I have told several niggers that I'm leaving to-morrow by the *Kingsland* for the north. The thieves will hear of this, and probably begin to empty the case to-night.'

'May I ask what are your best clues?'

'Certainly. The *spoor* round the tent; a stick left behind, of a kind which leaves no doubt in my mind that the offenders were coast "boys"; and the fact that my canvas bath and wash-basin and their covers were left hanging on a barbed-wire fence some distance away.'

'Does the last look hopeful?'

'Rather! It tells me that they have been so successful in the past that they are getting cheeky and careless. Also, I'm inclined to think they did not know that I *am* an old hand, and, of course, it may not leak out, after all.'

'Are you doing anything after lunch?' I said, as we arrived at the mess.

'Going to have a sleep. My personal "boy" is

doing the town patrol this afternoon. I shall spend the night from 9 P.M. onwards in the native quarter.'

'Want a pal?'

'No, thanks, old thing. Perhaps for the round-up, but not now. *One* might pass as being out for an *affaire amoureuse*, but *two* is a crowd in these shows.'

II.

Saliemu, Harashidi, and Saïdi, three natives of the race generally known as Swahili, were sitting in a small hut in the centre of the native village of Walindi at 9 P.M. on the date of Haswell's arrival.

Said Saliemu, 'The old, fat English *effendi* who was living in the big tent near the Goanese store left yesterday with his small *mizigo* [baggage].'

'Truly, he was a mean man,' said Saïdi.

'Yes; one who buys at the Banyan's stores and has no *mali Ulaya* [goods of Europe].'

'I heard that just after the sun had set there arrived another *effendi* with two *watuma* [servants] and much baggage. He placed his large black box at the head of his bed, and when he had bathed he went into the house which the English took from the hot-tempered German, to eat food.'

'Think you, Saliemu, that this is one of the white men of long ago?'

'No, stupid. All these English are *wageni* [new-comers].'

'I don't know, Saliemu. You know Bwana Maraboa* is here again, and several other hunters.'

'Truly, you are a fool, Saïdi,' grunted Saliemu; 'you know that all these are employed as spies against the *Wadauchi* [Germans].'

'Perhaps,' conceded Saïdi, reaching for a handful of boiled rice and fish, round a dish of which they were sitting on the mud floor.

'We are so clever, and have taken so much plunder from these people, that there is nought to fear. To-night we will take the black box whilst the white man sleeps, and bury it. Afterwards we will watch what he will do.'

'Yes, truly you are cunning as a hyena, Saliemu; and we will help you, that we may obtain much money to buy wives with when these English have gone home and there is nothing more to steal.'

. . . . . .

'The rain will hide our footprints,' whispered Saliemu, as, some hours later, they slipped through the sleeping town in the shade of the coco-nut palms. But the rain failed them as an accomplice, and stopped ere they had cautiously lifted the coveted box from the sleeping white man's bed-head.

'Leave the fool's bath of cloth,' said Saliemu disdainfully, 'and the other things with his name on;' and the obedient Saïdi hung them on the fence near by.

'The box is heavy,' muttered Harashidi.

'Then there is much wealth in it, and the distance is short,' responded Saliemu gleefully.

III.

The following night Haswell just managed to win his game at chess between dinner and nine o'clock, when he went away, and was seen no more till, next morning, his 'boy' found him in bed asleep.

At breakfast he looked fagged, and far less confident than on the previous day.

Inquiries as to the result of his search brought a frown on his face, and when Lloyd-Jones said something before a native, his only reply was, 'I wish you wouldn't teach your "boys" English.'

At lunch he was quite changed, and seemed deep in pleasant thoughts, even smiling once or twice to himself, till the O.C. said that a wire had come for Haswell to go south on the *Utaki* at 9.30 next morning. Looking up, Haswell asked if that would be the latest hour for embarkation; and on being informed that it would, he made some remark about having no kit, and began to talk to me about the unreasonable way in which he was thrown about the country, and the unsuitable tentage allotted to him, resulting in the loss of his treasured box.

In the afternoon we went out into the native village together, and he told me to look out for torn paper, letters or envelopes particularly. He took no pains to disguise the fact that he was searching for something, and seemed pleased when some natives stopped to watch our fruitless search.

At dinner he was obviously excited, and began to boast that he would teach the A.P.M. and others something useful before he went. After dinner he went, as usual, for his game at chess with the paymaster; and when he had left, one fellow dryly observed, 'Haswell was in good form to-night,' meaning that he had fallen into one of his bad habits, a tendency to brag of his exploits—a tendency, I may say, valued by me, his chronicler, as a means of getting information which questioning could not always obtain.

Once out of the mess, Haswell went round to the back-entrance of the yard behind our headquarters, and sent for the head 'boy.' The latter arrived at once, for Haswell was popular with the natives by reason of his good knowledge of the language, and consequent ability to make a fair *shauri* (inquiry) when anything went wrong.

'Go and get four reliable "boys"—strong ones—and a long rope, and be here waiting for me at the third hour of the night [nine o'clock].'

'Yes, *effendi*,' said the head 'boy,' and saluted.

* Bwana Maraboa, literally the 'Lord Arab,' a celebrated Boer hunter known throughout the coast and hinterland of East Africa.

IV.

Saliemu, Harashidi, and Saïdi were sitting over their rice and fish that evening. They had also a pile of dates, and there was curry in the stew.

Said Saïdi, 'The Englishman did not go as they said he would, and he was this day searching the ground near by. Even he looked into the yard of Saliemu's house.'

'He could see nothing there,' observed Saliemu complacently. 'There has been much rain since I buried the last things under the *tikitimagi* [melon] plant.'

'But I fear him, and am going home,' retorted Saïdi; and he and Harashidi got up, saying 'Farewell' to Saliemu, who finished the remains of the meal and lighted two more candles.

From under the bed Saliemu pulled out a tin trunk painted bright blue, with a tin lock on it, which he opened with a key from his belt—an old English Tommy's belt, with regimental buttons studding it.

Out of the trunk he took a revolver, and looked at it for a few minutes ere putting it back at the bottom of the box. Then he took out a leather case with a photograph in it of a white girl under a celluloid panel. After gloating over this for a few minutes, he put it on the floor, and began to place the other contents of the box in several little heaps beside it. As he did so, a voice outside asked, '*Hōdie?* [May I come in?].' '*Karibu* [Come in],' replied Saliemu.

The new-comers were two men and a girl (Saliemu's wife—or one of his wives). The men immediately sat down on the floor and began to bargain for the little piles of goods, showing a particular fancy for the Jaeger underwear, and curiosity regarding the photograph, which they looked at upside-down as well as the right way.

'Have you brought money?' asked Saliemu.

'No,' said one of the men; 'but Binti Asmani'—Saliemu's wife—'wants these bangles which my brother-in-law the silversmith has made.'

After some haggling a bargain was struck, and Binti Asmani put the bangles into her own box with many others, the proceeds of her husband's successful looting.

At that moment they heard a sharp '*Hōdie?*' at the door, made of rafia-palm strips strung together with male bamboo, and carrying a heavy wooden latch.

There was something about the salutation which made a shiver run through Saliemu and his wife. Something told him instantly that this was a white man's voice, and that he was one of the masters, one of those who had long ruled them with the *kiboko* (sjambok) in times gone by. One thought possessed them both: should he be owner of the white lady's photograph?

'If you move except to open the door, I will hang you all; and if you do not open the door, I will burst it open.'

Saliemu sprang like a trapped leopard against the light bamboo door leading to the yard, but felt it held tight by a man or men there already. Panic seized them all, and at that moment the front-door was burst in, and a white man in the dress of a British officer stood before them.

'Good-evening, Saliemu,' said he in Swahili. 'I have come to bring back to you the stick you left when you came into my tent the other evening.'

His eye fell on the photograph on the floor, and stooping, he picked it up and placed the case in his breast-pocket. Fury was in his eye. With Saliemu's tough, whippy stock he beat the native till he could beat no longer from fatigue; then, calling to his men, he ordered a rope to be fastened round Saliemu's neck and round the arm of one of his own escort.

To the others he said, 'You can go; but be silent. I require only this swine.' Then to Saliemu, 'Where is the case you stole?'

'It is buried, great master, just outside. But do not hurt me; I did not steal it. The "boy" of a white officer in the hospital of the English gave it me to keep for him, and I was frightened, and buried it.'

'And this is how you take care of the things in the box?' said Haswell, pointing to his revolver and other things on the floor which his 'boys' had unearthed. Then he called to his followers, 'Bring along everything.'

Twenty yards away Saliemu stopped, saying, 'If you dig, you will find the box.'

A few minutes sufficed to reveal the box, and when it was lifted out Haswell ordered, 'Go on digging to the depth of a grave, as is the custom.' When this was done he turned to Saliemu, saying, 'You will get into your grave, and if I do not find everything, even to the size of the tip of my finger, there you will die.'

There was no sign of relenting about this white man, whose people obeyed his least sign. Saliemu was thrown into the hole, and the filling-in commenced.

Saliemu, hardened ruffian and thief, was afraid. 'Great master,' he cried, 'I had two others in this affair, and will guide you to them if you will let me free, for I fear they have already some of your things.'

'Let him out,' said Haswell; then, addressing Saliemu, he went on menacingly, 'If you make a sound, or if these other pigs escape, you will be hanged.'

In less than half-an-hour the other thieves had been rounded up and attached to the rope, and practically all Haswell's property had been recovered, except a watch.

Saïdi and Harashidi got a well-deserved thrashing and some much-needed advice, and the three malefactors were safely lodged in the *boma* (fort) to await trial—not for the theft of Haswell's stuff, for, as he told them before he left, he did not owe them anything, nor they him, but for

previous thefts that could be traced to them on evidence which several of their less-involved accomplices were only too willing to give.

The following day a native woman came to Haswell's tent at 8 A.M., accompanied by one of his personal 'boys.' Half-an-hour later her husband arrived with Haswell's watch, which, he said, had been placed in his hand by a man who had run away, giving no explanation.

v.

Some months afterwards Haswell told me something of the way in which he got on the track of Saliemu & Co.

On the morning of the round-up, the servant of a friend of his, a Nyassa 'boy,' had said that three natives who had been in the fort for stealing had just been liberated, after what he considered a very light punishment. They had got medicine from a witch-doctor, added Haswell's informant, which they smeared on their hands in the belief that they would escape detection; and on one occasion they had entered a white man's house at midday and taken all his newly washed clothes from his room, though there were several Europeans sitting on the veranda, along which they had to pass on the way out.

'I believe in medicine in Africa,' said Haswell; 'at all events, I believe it is one of the strongest moving forces amongst the natives even to-day, and in unexpected places, too. So I told Pandika he should have twenty rupees *baksheesh* if he could find out the house of any of these men, and more if they turned out to be those I was in search of.

'He showed me Saliemu's house, and the conversation I overheard there on the evening of the capture was sufficient for me. My people were already at the back-door, and as I wanted to speak to these thieves myself, at each place I went in first. I guess what I said and did has knocked thieving back five years or so at Walindi. By-the-by, the padre and some other fellows were with me at the last two huts, and the padre has quite the right idea about dealing with those swine. He believes that the *kiboko* is the best way to make 'em talk—and the experiment justified his belief and mine. My net loss was one spur, one wristlet-watch strap (much worn), and a cotton vest, plus Pandika's thirty "chips."'

'I saw something about it in the Nairobi papers,' said I.

'So did I. Wasn't it a scream? The A.P.M. must have been flattered,' answered Haswell.

TWO JAMAICAN EARTHQUAKES.

WITHIN the knowledge of man the island of Jamaica, in the West Indies, has experienced at least two great earthquakes.

The first occurred on the 7th of June 1692, during the reign of William and Mary, and must have been a terrible convulsion, according to the records of the time, which state that mountains were moved and rivers changed their courses. The famous city of old Port Royal, at the mouth of Kingston harbour, was virtually destroyed, as two thousand eight hundred houses were ruined by the shocks, while over three thousand of the inhabitants lost their lives. The calamity was regarded as a visitation of God, Port Royal at that time having the reputation of being the wealthiest and wickedest city of the West Indies, for it was the headquarters of the buccaneers of the Spanish Main, who made it the emporium and mart for their ill-gotten gains. This is not to be wondered at when we read that only a few years previously the famous free-booter, Sir Henry Morgan, had been lieutenant-governor of the island.

Port Royal is situated at the extremity of a narrow strip of sandy land seven miles long, known as the Palisades, which encloses the harbour of Kingston, and the effect of the earthquake shock was to precipitate to the bottom of the harbour the greater portion of the city, with its inhabitants. According to the narrative of the rector of the parish at the time, 'whole streets, with their inhabitants, were swallowed up by the opening of the earth, which, when shut upon them, squeezed the people to death, and in that manner several were left with their heads above the ground, and were covered with dust and earth by the people who remained in the place. It was a sad sight to see the harbour covered with dead bodies of people of all conditions, floating up and down without burial, for the burying-place was destroyed by the earthquake, which dashed to pieces tombs, and the sea washed the carcasses of those who had been buried out of their graves.'

There may still be seen in a graveyard on the mainland the tomb of one Lewis Galdy, who, according to the inscription on the stone, 'was swallowed up by the earthquake, and by the providence of God was by another shock thrown into the sea, and miraculously saved by swimming until a boat took him up.'

It is not on record whether the 'visitation' had any effect on the morals of the remaining inhabitants, but the majority of those left migrated across the harbour to the mainland, founding the city of Kingston, which is now the thriving capital of the island.

Kingston, in its turn, was sorely stricken, but in present times, by a disastrous earthquake and fire which laid waste the city on the 14th of January 1907. The shock came like 'a bolt from the blue' on a peaceful tropical afternoon, with the sun blazing in a cloudless sky, and a gentle wind barely ruffling the waters of the quiet harbour. Scientists tell us that the quake was caused by a slipping of strata in the ocean-bed to the south-west of the island; but, whatever the cause, the shock was terrific, and struck across the island like a blow from a giant flail.

In less than twenty seconds the business section and many residential quarters of the city were crashed to pieces, while fires sprang up in all directions, blazing furiously throughout the night, despite all efforts to quench them. Many unfortunates were burned alive, imprisoned under the débris. The streets were almost impassable, blocked as they were with the ruins of the buildings and by the fallen telegraph, telephone, and street-car poles. Panic prevailed amongst the coloured people, who fell on their knees in the streets and prayed to the Almighty for mercy. Their alarm was not lessened by the shocks which continued throughout the night. However, the native police and troops behaved admirably, and with their aid cordons were established, and the people were herded into the open spaces. The number of victims from the catastrophe was never precisely ascertained, but it has been estimated that between one thousand and one thousand five hundred persons perished, of whom many were prominent citizens. A leading lawyer was penned in by a falling beam in the court library; but the building did not fall, and he eventually escaped through a window by means of the fire-escape.

A marble statue of Queen Victoria, which stood in a square at the entrance to the public gardens, was reversed almost completely on its pedestal by the shock, but did not fall to the ground.

The lighting apparatus of the lighthouse on the outside of the Palisades was completely shattered, with the result that on the following night the Hamburg-American steamer from New York struck on the reef and became a total wreck.

This earthquake is perhaps best remembered by reason of the action of the governor of the island, who gave great offence to the admiral in charge of the U.S. Squadron, who had brought his ships over from Cuba to render assistance. The marines and sailors were doing useful work in the streets, pulling down dangerous buildings, when the governor objected to their presence, writing to Admiral Davis in such terms that he had no alternative but to withdraw with all his vessels, including a hospital-ship filled with supplies which were sorely needed by the stricken people.

The American press published the letter, and the British Government forthwith required the governor to apologise to Admiral Davis, which his Excellency forthwith did, at the same time tendering his resignation to the home Government on the ground of old age!

The value of property in Kingston destroyed by the earthquake of 1907 amounted to about two million pounds. The city has now been almost entirely rebuilt with reinforced-concrete structures, and is well worth a visit.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER II.—*continued.*

VI.

IT was the last day of the voyage, and Clement Seadon, supremely conscious of the fact, was feeling baffled.

Again Heloise Reys was proving unapproachable. Again he was finding it difficult to get near her because of the crowd about her. The Gorgon clung to her side with leech-like tenacity. The massive and mountainous Mr Neuburg was always ready to rush in and take up the guard. The vigilance of the first days of the trip was resumed.

But now Clement could not view this blockade with equanimity. He could not smile and bide his time—there was no time. Already they were passing up the mighty river St Lawrence; already the end of the voyage was in sight. A few hours only were all that were left to him. He must get her alone.

He could not get her alone—not for a moment. And as the day relentlessly advanced, a further, a more disturbing, thought was borne in upon him—she did not want to be left alone with him. He began to realise this with a sense of dismay. It was she who was putting barriers between them. It was she who kept her companion close at her side, who actually invited the big man to fill the vacancy when the companion went away. It was not the pair shutting him out; it was Heloise herself deliberately shutting him out with the pair.

He was disturbed; he was baffled. He could not understand it. She had left him in perfect friendliness last night. There was no hint of misunderstanding, estrangement. Why had she changed? What was causing her to stand so aloof from him? Was it the doing of that precious rascally pair? Was it anything he himself had done or said? Was it, perhaps, the

way he had talked about the mining venture? He did not think so. He knew that had pained her—that could not be helped; but it had not offended her. She had left him without any hint of an altered regard for him. She had left him—well, in such a manner that he had felt confident of winning her as a lover.

No, it wasn't that. But what was it? Some deep and cunning game of those rogues. Something subtle and devilish emanating from the brain of that master-villain Neuburg—that was the only explanation. But what it was he could not find out. He racked his brain for explanations, and none came. And the fact that there was so little time to find out, that there was so little time to win back her confidence—that, and the real ardour he felt for her, robbed his wits of their habitual steadiness, made them unstable, inefficient in a crisis.

And the crisis came. It came with an unfair abruptness. It could not be aught else, for Heloise's wits were also in something of a whirl. She was dreading the moment of confronting Clement, just as she was determined that she would do so. Her mind had been an affair of veering instability all day. Now she believed him to be underhand, now she disbelieved. Now she hated him, now she thought he could do nothing dishonourable. Now she made up her mind to go to him, now she held back. She was a mass of hesitations and decisions; she was hot, and she was cold.

And she being in that condition, and he being in his, the actual moment was a scrappy and nervous episode in which both failed to rise to the occasion. Heloise reached her decision a few minutes before the dressing-bugle sounded. Clement had tramped past her in dark loneliness, had turned and passed round the end of the deck. She felt, 'I must do it now or never.' With an indefinite gesture, more than half an appeal for support, to her companion, she rose and went after Clement.

She actually expected to see him on the other side of the deck, and she would call him and hand him his letter. But when she reached the end of the deck she actually ran into him. He had swung round on his heel, returned in his tracks. As a matter of fact, he had made up *his* mind to talk to her, to demand an explanation from her.

They met. It was a shock, their meeting. They stared at each other a little breathless. Then, 'This is your letter,' said Heloise.

Clement took it, looked at it, frowned.

'Yes it is,' he said. 'But how on earth'——

Heloise wasn't going to trouble about trivial explanations as to how it came into her hands. 'I looked at it because Rigby & Root are my lawyers as well as your own. Did you know that?'

Clement was too honest, as well as too startled, to tell anything but the truth.

'Yes, I did know it,' he said.

Heloise's breath caught in something like a sob. There was a sudden blaze of contempt and anger in her heart; she had trusted this man—and liked him.

'And you knew about me—about the reason of my voyage?'

'Miss Reys'—— he began.

Heloise was too bitter to allow explanations. 'Did you?' she cried. 'Did you?'

'Yes, I knew; but'——

'You knew!' she cried at him, and her face was white. 'And you were acting in the interests of—of Mr Hard?'

Clement stared at her. This sudden attack, his emotions of the whole day, had left his wits woolly and bewildered. And of course he was, in a sense, acting in the interests of Mr Hard. If he said he wasn't, he would be lying. And yet Mr Hard wasn't the whole of the thing. But the whole of the thing—how could he explain it to her in this unsympathetic mood, in the presence of her arch-enemy and his, Miss Méduse, in a few brief minutes of time? He couldn't explain. He could only temporise. He cried, 'Miss Reys, there is an explanation behind it all'——

He got no further. Heloise read his hesitation correctly. He *was* acting for Mr Hard. He had, under the guise of honesty, been conspiring against her. And because of the great trust, and something more, she had felt for him, she was the more bitter.

She turned about. Clutching the arm of the clever Miss Méduse Smythe, she walked away, left him.

VII.

The first thing Clement Seadon did was to give way to one of those outbursts of anger that, in time, bring calmness. They had scored over him, they had tricked him, these blackguards. They had dealt him a very damaging blow.

Then from this anger against their very definite triumph, his cooling brain turned to the matter which had helped them to score that point. The explanation he found was perfectly simple. That letter had been stolen from his despatch-case. He was not of the type that leaves letters lying about, particularly lawyers' letters. Theft—that was the solution. Some one had been through his effects. They had found this letter, appreciated its worth as a means of alienating Heloise. They had been clever, as clever as he thought they were, and had struck at him at the psychological moment.

Who had been the thief? That, again, was easy. Who else but the rascally steward, a fellow in their pay, a member of the gang, who, moreover, had the right to come and go in all the cabins. And, now that the thing was brought acutely to his mind, he recalled seeing the rogue

hanging about in the gallery, conspicuously near his door. He remembered him, not merely because of his redoubtably evil face, but also because he was so resolutely dirty. His should-be white steward's jacket had a beastly and disfiguring stain of yellow—rust, perhaps—up the left arm and shoulder.

Yes, that criminal-looking steward was the thief. But what matter? That part was past and over. Could the thing be remedied? Clement thought of this bitterly and tragically. It looked black. It looked as though Heloise Reys would for the future hold him at arm's length. Only, she must not. For her own sake, if not for his, he must prevent her holding him at arm's length. His fault must be remedied. He must speak with her.

He was aware that it would be a difficult task. He might see her and be able to speak to her to-night, after dinner; but he was not hopeful. She would evade him. Neuburg and the Gorgon would see that she evaded him. There was so little time to act. To-morrow—less hope to-morrow. The hustle and bustle of leaving the ship at Quebec would give no opportunity. At Quebec—he gained a ray of comfort. At Quebec, yes, it might be done. He knew that she was to stay at the Château Frontenac for at least two days. She had told him that. She had told him that she had rooms reserved there. And so had he. Well, if he could not do something, see her, even if he had to force himself upon her, during those two days, then he wasn't the man he thought he was.

Quebec would be his salvation. Quebec would see him right himself with her, put him on a footing which would enable him better to counteract the plans of her enemies. He felt more sanguine.

More than that, he felt his old capacity and alertness come back to him.

It was as well they did. He had full need of those qualities.

For the gang was not leaving things to chance. Mr Neuburg, that master-mind, was aware that Quebec would give Clement opportunities for regaining ground with Heloise. Mr Neuburg meant to prevent that. Mr Neuburg meant to act.

As the great liner pushed up the vast river towards that city of beauty and history, that on its great cliff hangs like a fairy citadel over the shining waters, Mr Neuburg acted. He devised an acute, a cunning, and a beastly plan for getting Clement Seadon out of the way. It was a scheme so complete and sure that it would certainly entirely cut off the young man from Heloise Reys while she stayed in Quebec, and perhaps it would keep him fully occupied for much longer than her stay in that wonderful French city. It was an excellent plan, a thorough plan. Mr Neuburg put it into execution.

As the big vessel was being warped into the dock-side, Clement Seadon, who had remained on deck to the last possible moment in the hope of seeing Heloise Reys, went below. He went below disconsolately to gather together his traps, and to prepare for his effort in Quebec.

He went below, past the busy stewards working in their shirt-sleeves among the baggage, past their 'glory-hole' full of their clothes and their intimate litter, past the many scattered trunks and suit-cases ready to be taken off, past the wholesale reminders of voyages ended, and into his own cabin.

His own kit was, of course, already packed. A good traveller, he had got through that swiftly and early. Now he gathered together his stick and his mackintosh and his hat ready for departure. He sat down on his bunk and felt for his cigarette-case.

His cigarette-case indicated the state of mind he was in, for it was empty. For a moment, and in sheer desperation, he felt that he could not be bothered to unstrap his suit-case and dive to its bottom for smoking material. Then he drove his melancholy from him, and pulled the heavy leather case towards him.

In thirty seconds his hand encountered something hard and edgy—something strange to his groping fingers. He tugged it out.

In the palm of his hand lay a thing that glittered and flashed—a thing of immense worth. A thing of diamonds—*a woman's tiara.*

A woman's diamond tiara in his suit-case! It was incredible.

Then Clement Seadon jumped to his feet alertly. He saw the meaning of that tiara at once. It had been put into his case purposely. It had been put there so that he should be branded as a thief; that he—by gad!—that he should be arrested, be kept under lock and key while Heloise Reys was in Quebec.

He saw it all. The devils, the clever devils, this was their plan—Neuburg's plan—to get him out of the way.

What should he do? The thing was immensely valuable. Some woman cherished it. Return it? No; couldn't risk wandering about with that in his possession, for anybody to fling accusations. Oh, but there was something quite simple—there always is. The purser—he'd run right along to the purser, hand it to him, say that he had found it. He'd do it now, quickly. He guessed he'd have to be quick. Neuburg and his gang would see to it that the loss of that tiara did not go long undiscovered. They'd probably already arranged that suspicion should fall upon him. He must be quick.

He stepped rapidly from his cabin; almost ran along the gallery towards the purser's office. He did not get far. Before he came to the accommodation stairs that led up to the smoking-

saloon, stairs that stood between him and the purser, he heard an excited babble of voices coming down those stairs.

Yes, there was a definite excitement in them. Men's voices raised in protest and advice. A woman's voice, hysterical and accusative—vindictive. A woman who had a grievance. A woman who had missed something.

The hunt was up. They were after that tiara.

It was absolutely impossible to go on. They were bound to see him—and he had that damnable tiara on him. He glanced about wildly. There seemed no way of escape. The voices were very near. They were about to come round the corner. Like a fox bolting to earth, Clement Seadon dived into the empty 'glory-hole.' He crouched behind the door amid the hanging coats. The voices passed him, talking at a babble. He heard them drifting along the gallery towards his cabin. He stood up, scrutinising his lair carefully. No other way out except by the door he had entered by. He waited a few moments. Then he stepped out quietly. He walked a little way towards the purser's office; he must not on any account show haste. He heard voices behind him; he faced about for a moment and looked. It was a crucial moment. As he looked, the captain of the ship walked out from the alleyway in which his cabin stood, looked along the gallery towards him—saw him.

He saw him, and immediately called out, 'Hallo, Seadon!'—genial Captain Heavy was an old friend—'I say, you're the man we want. Would you mind coming along here for a moment, my good chap?'

Clement Seadon, with a throbbing heart, went along. He went to his own cabin. There seemed to be a crowd of people in that cabin. In the blur which his painful sensations brought to him Clement could only distinguish one excited and angry lady and a steward—the evil little steward. He turned his face quickly away from these. He looked at Captain Heavy. He meant to say something to Heavy, but his mouth was parched.

Captain Heavy, his good-tempered face frowning, understood that inquiring look. 'Yes, it does seem an idiot mob to thrust into a man's cabin, old chap. None of my doing. I—well, look here, it's a rotten and unwarrantable thing, but—but, you see, this lady has lost a valuable piece of jewellery—a diamond tiara. She says it has been stolen.'

'It *has* been stolen,' snapped the lady.

'Well, she says it has been stolen. And one of the stewards declares he knows who did it. In fact—in fact, old man, he has the—the effrontery to say that it was—*you*.'

'Well?' said Clement, in a voice whose evenness surprised him.

'Well—well,' said the distressed captain—'well—they came along to see for themselves—to—to search.'

(*Continued on page 136.*)

THE COLOUR OF GOLD.

By R. B. Townshend.

PAY gravel, as we used to call it in Colorado, is a thing pretty scarce in England—so scarce that I cannot name any spot where an old Rocky Mountain prospector would have the least expectation of finding 'the colour' if he were to wash a pan of dirt. In Ireland, Scotland, and Wales, however, gold may still be found in some of the mountain-streams, though any diggings there worth working have long since been played out. In Ireland in ancient times much gold was undoubtedly won along the Vale of Avoca and elsewhere; in Wales the Romans mined for it successfully near Llandovery; and not so many years ago in Scotland some returned Australian miners found enough to keep them going for a few months in Strath Kildonan in Sutherlandshire. Indeed, we have a beautiful sample of this Kildonan gold at the Museum in Oxford.

A prospector who is out to look for gold takes with him pick, pan, and shovel; but if he thinks both pick and shovel too cumbersome, he can carry instead a soldier's light entrenching-tool, which combines the two, and serves well enough. His prospecting-pan is of iron, untinned; when tinned the surface is so slippery that the grains of gold are apt to slip out over the edge unnoticed. You will not find such an untinned pan at an ordinary ironmonger's, but the shopkeeper can easily procure one for you by ordering it from the works. The pan may be of any convenient size—say eighteen inches across. What is most important is that the side of it should not be perpendicular, but should slant at an acute angle from the bottom. If, for example, the pan be eighteen inches wide and four inches deep, the bottom of the pan ought not to measure more than ten inches in diameter.

The way to use the pan is this. Choose a place in the bed of a stream where the gravel has accumulated, and if you have any real hope of 'finding the colour,' the nearer you get to bedrock the better. Prospectors call any smallest speck of gold 'the colour'; they will often speak of finding so many 'colours' to the pan. To have any chance of seeing 'the colour' at the bottom of the pan, the stream you select to prospect should be one that has

brought down its gravel from mountains where there are quartz-veined rocks of a granitic or a metamorphic type. 'Quartz is the mother of gold,' used to be a regular old prospector's saying, and though the gold of the Rand comes, I believe, from a sort of conglomerate, the old-timer of forty years back would no more have thought of looking for gold in a sandstone or a limestone formation than he would have thought of flying. Times change, however, and the air is full of flying-men now; and the Rand 'banket,' which is described as being a sedimentary rock, is actually the richest gold-deposit in the world. But there is no Rand banket in England. Nevertheless, even if you cannot find gravel of the right sort here, you may at least contrive to learn the art of panning in your own garden with any of the common yellow flint gravels of our southern counties. Only, as they certainly won't have native gold in them, you had better stimulate your interest and give the game a touch of reality by putting a little 'salt' in the pan. If you have the nerve to risk it, you may salt the pan with real gold-dust, though, as you might fail to save your salt, such seasoning is liable to come rather expensive. Instead, you may very well make shift with brass. Cut up some brass wire, or any scraps of that cheap but showy metal, into small bits of the size of shot, both coarse and fine; while, in order to imitate 'scale' and 'flour' gold, you may add a little spelter. Shovel gravel into the pan till it is more than half-full, and then add your pinch of salt, be it real or imitation. Now dip the pan under water in a large tub, say, and swill it round with vigour, so as to shake up the contents thoroughly. If the gravel is clean, you can be certain that after a few good shakes under water all the gold, even if it be only brass 'gold,' has got to the very bottom of the pan by its specific gravity. The specific gravity of water is 1 (this means that water is taken as the unit of gravity); that of the particles of gravel and sand will probably run no higher than from $1\frac{1}{2}$ to $2\frac{1}{2}$, while gold is about twenty times as heavy as water, and brass about eight times; so that it is obvious that when you put in water and shake the pan till the gravel washes around loose in it, the 'gold' (whether it be real or only brass), being so much heavier, will sink to the bottom of the gravel, just as surely as the stones themselves sink in the water.

This is the whole principle of gold-washing, provided always that the gravel that is washed is clean. If it is clayey, the small bits of gold may and do stick to the clay that adheres to the gravel, and will be washed out of the pan with it. So, if your gravel is clayey, you must work it about with your hands till the water is all muddy, and repeatedly run off the water till the clay is gone and there is only clean gravel left. Now you can get to work on fair terms, and it should not take you five minutes to wash your pan of dirt. Slant the pan with the lower edge under water, and swill the water out so as to carry away the top gravel. If there are stones in it, as big as small plums, say, you can rake them out over the edge with your fingers. Shake up the pan again, always keeping it on the slant, till you feel sure the gold has gone back to the bottom angle of the pan; swill off the top gravel again with a sort of side-to-side shake, ending in a forward toss; and continue to do so till there is only a cupful or less of the finer gravel and sand left in the pan. Work this last stuff very carefully, using less and less water, and shaking back the still unseen gold down to the bottom angle constantly. And now, when only a few spoonfuls of sand are left, streaming out from the angle of the slanted pan towards the rim, you will catch the yellow flash of the heavy bright metal as it hangs behind at the tail of the sand, the metal that so many thousands—ay, millions—of men have given their lives to win.

That flash makes the imaginative mind think many things. One of the earliest men, some savage hunter of the woods, with a sharpened stone for his only weapon, saw a yellow gleaming nugget long ago in the bed of some mountain-stream, and, attracted by the bright colour, he picked it up and tried to chip it to an edge as he chipped his flints. But the yellow gleaming stuff, unlike any other stone, refused either to chip, or break, or crush; instead, it yielded to the blow, and was bent or flattened. Man had found metal, and of all metals the most workable, the most malleable. True, it was quite useless for practical purposes—he could not make an effective axe or spear-head of it; but it was beautiful to see, so gleaming bright, so untarnishable, so readily shaped into an ornament to be worn by himself or by his no less savage bride. For man's sense of beauty was already born. And so the finder and his fellows gathered gold, admired it, wore it, and thus inaugurated the golden age celebrated by poets. Later came the age of copper, merging into bronze, itself in turn to be superseded by iron; but the age of gold was first. Moreover, there was plenty of it then in many countries, including those Scottish and Irish mountain-glens, and the lucky finders traded it to neighbours who could by no means find 'the colour' in the creeks that ran through their hunting-grounds; and thus it passed from hand to hand till this strange, soft, yellow stone that would not chip became familiar to all the world. From that day forward the eye glances, bird-like, down the stream of history, and sees how, ever since, men have fought and died for gold, and are destined yet to fight and die in ages to come. They fight singly for the perilous glittering treasure; they fight for it in companies and nations. It was only too true what we used to say in the Rocky Mountains: 'A good claim and a graveyard are very near neighbours.'

THE CABIN PASSENGER.

PART IV.

XI.

THE mate's musings were interrupted by the sound of a fall, accompanied by a loud ejaculation and a picturesque and varied flow of comment. The sounds appeared to come from the other side of the deck-house. Passing around it, he perceived Mr Pickett lying on his back before the lower rung of the starboard companion, with an expression of agony on his face. The mate leaned over the poop railing and stared down at him. 'What the blazes is the matter?' he asked.

'Matter!' exclaimed Mr Pickett, screwing his countenance into what he imagined to be an expression of excruciating pain. 'I've fallen down your blamed little ladder here, and sprained my ankle.'

'Which one?' asked Mr Briggin, with a very mild pretence of sympathy.

'Which one?' repeated Mr Pickett, somewhat taken off his guard. 'Oh, the right one, of course.' He sat up and felt the spot he indicated tenderly. 'Say,' he said dolorously, 'I guess I'm lamed.'

'Can't you stand?' asked the mate cautiously.

Mr Pickett turned upon his hands and knees and dragged himself up by the bulwarks. He then proceeded to put the weight of his body on the right leg, and at once exhibited the picture of a man undergoing the tortures of the Inquisition. It was an artistic performance, and it did him credit.

'Say,' he said, 'you'll have to help me into the cabin.'

'I'm not so sure about that,' said Mr Briggin slowly.

'Not sure!' exclaimed Mr Pickett, staring.

'I'll have to see what the captain says about it,' replied the mate. He knocked three times on the front of the deck-house; it was a recognised call in cases of emergency. Captain Keynes came out hurriedly and joined his officer by the poop railings. 'Says he's twisted his ankle,' said the mate briefly; 'says he can't stand.'

Captain Keynes looked down at Mr Pickett, and there came into his eye a spark of triumph. 'Can't stand, can't he?' he said slowly. 'Then I guess he'd better walk.'

'Walk!' said Mr Pickett indignantly. 'How do you suppose I'm going to walk if I can't stand?'

'He says, sir,' said the mate, 'that we'll have to help him into the cabin.'

'Sure it's as bad as that?' asked the captain, addressing Mr Pickett with a fine affectation of sympathy.

'You'd know if you had it instead of me,' answered Mr Pickett.

'I guess I'd better come down and have a look at it,' said the captain slowly.—'Mr Briggin, you'd better go into the cabin and fetch me a couple of towels. It'll want fixing up before we move him.'

The mate complied. Returning from the cabin with the desired articles, he came across Miss Keynes. 'Passenger's sprained his ankle,' he explained with sarcastic enjoyment, 'and I reckon your pop's going to fix him.'

'First-aid?' queried Miss Keynes brightly.

'And last,' replied the mate, grinning. 'The last he'll want, anyhow.'

'Then I think I'll come and see if I can be of any use,' said Miss Keynes.

Mr Briggin scratched his head. 'Better not, I guess,' he answered. 'Your pop's first-aid is apt to be a bit rough.'

'Oh, it won't be rougher than that man deserves,' said Miss Keynes with a smile. 'I shall enjoy seeing it.'

Mr Briggin looked his admiration. 'Come if you want to,' he said, and joined the captain, followed by the girl. Mr Pickett looked up at her with a sheepish grin. She frowned repressively and shook her head. Captain Keynes, by whom this by-play was unobserved, took the towels from the mate's hand and descended the companion, beckoning Mr Briggin to come after him. The mate, who recollected having played this game at least once previously, did so, carelessly unhitching a coil of rope that hung on the poop railing, and allowing it to fall to the deck not far from his intended victim.

Meanwhile Captain Keynes knelt on the deck just before his patient. 'Now then,' he began soothingly, 'let's have a look at it.'

'Say, don't you go putting your ugly paw on it!' said Mr Pickett, fearful lest a closer inspection should reveal the fraud. 'A touch hurts like a red-hot needle.'

'You can leave it to me,' replied the captain, with a face of brass, gently drawing off Mr Pickett's boot. 'I'll fix you up with this towel in no time.'

With a practised hand he made a clove-hitch and ran it about the injured ankle. Then, with a sudden jerk, he ran it about the other ankle, bringing Mr Pickett violently to the ground. 'Ropes, there!' he shouted. 'Ropes, Mr Mate! Sharp about it, now.'

Mr Briggin needed no second bidding. Snatching up the coil of rope, he flung it over Mr Pickett's arms, and had it wrapped about him three or four times before the astonished prize-fighter had realised what had happened. Then, aided by the captain, he began to tie the knots scientifically. In spite of the struggles of

their victim they worked with a will, and in a little time Mr Pickett, who had become purple in the face, looked like a large blue-bottle fly that had got itself caught in a spider's web, and had succeeded in wrapping the web around it.

Then Captain Keynes stood up, took a long breath, and relieved his feelings by a hearty kick on that part of Mr Pickett's anatomy which he judged most suitable for the purpose. 'Now then, my lad,' he said grimly, 'you 're going to pay for your fun. You 're going to pay for the time you 've had on this ship, and I 'm the man to see you pay in full. To-morrow, when we get to Papeete, you 'll go ashore in charge, like the mutinous hound you are. For the present—— Let 's see what we 'll do with you for the present.'

Mr Pickett rolled his eyes, first at the captain, then at the mate, and lastly at Miss Keynes, whom he regarded very much as Samson must have looked upon Delilah. 'What about the cabin?' he suggested sullenly.

'Think again,' replied the captain, with a grin. 'I guess your cabin days are over.'

'Put him in the fore-peak, sir,' suggested the mate enthusiastically. 'It 's full of rats.'

'I guess not,' answered the captain after a moment's consideration. 'I guess we want him somewhere where we can keep an eye on him. Call a couple of hands, Mr Mate, and we 'll trice him up in the shrouds here. He can spend the night thinking over his sins, and in the morning, when we go in, we can hand him over.'

XII.

Mr Briggin hastened to comply. Two of the hands were summoned aft, and did not attempt to conceal their amazement at finding in such a predicament a person whose doings had formed the subject of considerable conversation in the fo'c'sle. They had, however, but little opportunity of expressing it. Captain Keynes, after asking them if they thought they were on board his vessel for the purpose of posing for living pictures, bade them jump. They jumped to obey his commands, and in a little time Mr Pickett found himself hoisted into the starboard shrouds just above the taffrail, and securely lashed there. Beyond remarking that he was damned, he made no comment. The situation was beyond words. Captain Keynes, having examined the fastenings, and satisfied himself as to their security, returned to the shelter of the cabin, rubbing his palms together. The hands went for'ard. Mr Briggin alone remained, grinning at Miss Keynes.

'It 's a clever man that gets the better of your pop in the long-run, missie,' he observed.

'Or of you, Mr Briggin,' answered Miss Keynes sweetly. 'I don't think any man can get the better of you for long.'

The infatuated mate broke into a gratified guffaw. 'I guess that 's so,' he answered. 'You won't have any more trouble with him.'

He gazed at his handiwork with pardonable pleasure, and followed the captain into the cabin.

Miss Keynes took a rapid glance about her to see that the coast was clear, and then stepped down the companion and came close to the spot where the prisoner was fastened with his face to the sea. 'Mr Pickett!' she said softly.

There was no response. Mr Pickett was digesting his injuries and apportioning the blame for them.

'Mr Pickett!' she repeated. 'Mr—er—Jim!'

'Well?' growled Mr Pickett. 'What have you to say?'

'Only one word,' replied Miss Keynes quickly.

'And what 's that?'

'Trust!' said Miss Keynes impressively.

'Ah,' said Mr Pickett, after a malignant pause, 'that 's what I am!'

'What do you mean?' asked Miss Keynes, puzzled.

'Trussed!' said Mr Pickett with vicious emphasis. 'Like a blooming fowl. And I hope you 're pleased with yourself.'

'I wanted to remind you that you were to trust me,' said Miss Keynes, somewhat hurt.

'Seems to me I 've done it,' answered Mr Pickett. 'And I don't like the place it 's landed me in. If it wasn't for that fake of yours about a sprained ankle, I might have been kicking your pop about the deck now.'

'Poor poppa!' said Miss Keynes softly. 'You mustn't hurt him—for my sake.'

'It doesn't look as though I 'm likely to get the chance,' replied Mr Pickett ruefully. 'Look here, what 's the game? Are you straight?'

'You 've got to believe it,' answered Miss Keynes with spirit. 'You 've just got to believe it, or I 'll leave you where you are, and never stir a finger to help you.'

'That settles it,' said Mr Pickett. 'Of course I believe it. You 're quite right. I 've got to.'

'Very well, then,' answered Miss Keynes. 'And now just listen to reason. To-morrow morning we get to Papeete. If you 'd been at large on deck, pop would have lain off-shore until we could have signalled the police to meet him. You 'd have been marched off, and he 'd have gone with you, and you 'd have landed in clink. But seeing that he 's got you safe, I think I can persuade him to let me go up-town and send down the police. I can talk their lingo better than he can; and he 's sure to have a lot to do with the manifest and the cargo. So I 'll go ashore and send down the policemen.'

'And what the dickens does it matter who sends them as long as they get me?' demanded Mr Pickett wrathfully.

'You 're a thick-headed old dear!' answered Miss Keynes with composure. 'And I can see that you 'll have to trust it all to me. Now, not another word. The mate may be on deck at any time now.' She made as though to move away.

'Hold on!' said Mr Pickett. 'How long am I going to be tied up here?'

'Oh, pop will take you down in the morning,' answered Miss Keynes hurriedly. 'He'll never go into port with such an ornament to his rigging. Pop isn't a pirate. You'll see.' She glanced about her once more hurriedly, and then looked up at him with a mischievous smile. 'Jim!' she said softly. 'Jim, you've no idea how nice you look up there!'

A growl from the rigging was the only response. Miss Keynes, still smiling, went into the cabin, and shut herself into her own compartment. Here she settled herself to map out a plan of campaign. Mr Pickett, in the meantime, remained where he had been lashed, staring out at the rapidly darkening sea, and revolving schemes of future revenge which included a comprehensive slaughtering of practically all skippers and mates who sailed the Western Ocean.

XIII.

Miss Keynes had judged rightly when she had said that her father would not care to enter Papeete with Mr Pickett adorning his rigging. The sun had climbed behind the lofty mountains of the island, and had thrown a soft light upon the peaks of Eimeo, when he was taken down and laid, still bound, upon the deck. A little later Papeete appeared upon the port bow, its white houses nestling in an all-enfolding setting of green. They passed through the reef by the northern passage, and drew in towards the Government pier. Already preparations had been made for their reception. A clerk of the firm to which they had been consigned stood on the jetty, looking trim and neat in his white drill and his pith helmet. About him, Chinese and Kanaka stevedores stood ready for the shifting of the cargo. Miss Keynes was too well versed in her father's moods to attempt any conversation with him as the ship drifted down to its berth. But the boat once fast, she jerked her head towards the bound figure of Mr Pickett and spoke. 'What are you going to do about him, poppa?' she asked.

'I'll attend to him later,' answered Captain Keynes brusquely. 'I guess I've something more important on hand than to attend to that swine just now. But he'll have his turn. He'll not complain of want of attention when I've finished with him.'

'I guess I'll go ashore,' said Miss Keynes coolly. 'And, if you like, I'll call at the police-station and tell them to send a couple of men down.'

'That's an idea!' admitted the captain. He saw the clerk approaching him, pencil and note-book in hand. 'That's an idea!' he repeated. 'Send 'em along, and tell 'em to keep him fast till I come to charge him.'

Miss Keynes nodded airily and walked towards the gangway. As she passed Mr Pickett she glanced at him reassuringly. Mr Pickett, lying his length on the deck, stared after her. Something was going to happen, no doubt. But the situation was beyond him, and he could only await events.

They did not keep him waiting long. Half-an-hour later two gendarmes arrived, clad in white drill and pith helmets, and wearing swords at their sides. One was tall and thin, with a black moustache, and a tufted imperial upon his chin; the other was stout and fair, and full of importance. The taller of the two possessed some broken English, and managed to make it clear to the skipper that they desired to take charge of a man for whom they had been sent. Captain Keynes led them towards Mr Pickett, and cut the lashings that bound his feet. Then he assisted the boxer to rise with one or two kicks.

'Take him along, and keep him till I come,' he said.

'We onderstand,' answered the tall gendarme. 'We have instructions. *Mais oui!*'

They gently indicated to their prisoner that he was to accompany them.

Mr Pickett paused a minute and regarded the captain significantly. 'Say, boss,' he said, 'I should like to meet you again.'

'You'll do that,' said the captain viciously, 'in about an hour. You can cool your heels in the station until then.'

'I guess that's not the meeting I'm after,' replied Mr Pickett. 'I guess I'd like to meet you alone.'

'I guess that's all the meeting you'll get,' retorted Captain Keynes mockingly. 'And I guess you'll find it enough for you.'

The taller of the two gendarmes evincing impatience, Mr Pickett made no further reply, but with bound hands accompanied his escort over the gangway and up the pier in the direction of the town. Captain Keynes looked after him until he was well on his way, and then turned to matters of more immediate importance. The hatches were already off and the cargo was being unshipped. A babel of confused noises arose. Not for a full hour did Captain Keynes get time to consider his prisoner; then he straightened himself, glanced at the Frisco steamer going out through the North Passage, and sought the mate, whom he found, very red in the face, tallying cargo by the fore-hatch.

'Mr Mate,' he said, 'take charge till lunch-time. I'm going ashore to settle up with that swine that gave us the trouble on the voyage.'

'Ay, ay, sir,' replied Mr Briggin heartily. 'I saw the cops had been for him.'

'My daughter sent them down,' answered Captain Keynes brusquely. He had not been blind to the mate's admiration, and had made up his mind that it was to be repressed. He had no intention of permitting his girl to marry a mere mate, even though it was *his* mate.

'She's got a head on her shoulders,' replied Mr Briggin admiringly. For just a moment he permitted himself a brown study on the subject of fitness of time and place for making his intentions known to his prospective father-in-law. Before he could arrive at any conclusion, his meditations were cut short by a blow on the head from a package swinging at the end of a derrick which nearly sent him into the hold.

'If you don't look out you won't have any on yours,' answered the captain dryly. 'Look alive till I come back.'

XIV.

Captain Keynes left the ship and made his way to the *gendarmerie*. Announcing himself, he was shown into a large, somewhat sparsely furnished room, where, behind a desk, sat the *commissaire*. The *commissaire* was a little man with black bristling hair, cut short upon his forehead. His eyes were dark and dreamy, his lips full. His figure inclined to *embonpoint*. The sunlight, filtering through from a large compound at the back of the building, fell with a slightly greasy effect upon his skin. There was about him an air of tenderness, a middle-aged aftermath of romance. Beyond the window two or three coco-nut palms stood across the compound, and on a bush near at hand a gaudy parrot preened its feathers. The *commissaire's* fat fingers clasped and unclasped themselves as he listened to the skipper's tale, and at its conclusion he unclasped them and threw them apart in comical astonishment.

But yes!—certainly—a young lady had been there; and, in accordance with her request, he had sent two gendarmes to the ship. But the story she had told had not been in accordance with that given by M. le Capitaine. Yes—the young lady was dark; and her eyes—ah, they too were dark—of a darkness—— (The *commissaire* rolled his own eyes to the ceiling rhapsodically.) She had been in great distress. Her lover—— Had M. le Commissaire ever loved? Yes, M. le Commissaire had loved—perhaps loved still. Her lover, then—a king among men—had gone far to prove to her his devotion. Hearing that she was sailing for Papeete, he had embarked upon the same ship as a common seaman, solely in order to be near her. Unfortunately he had incurred the wrath of the ship's mate, who, urged by jealousy, had influenced the captain. The young man had been shamefully treated. He had been bound. Did not M. le Commissaire feel for him?—for her? She had shed tears—behind a tiny *mouchoir*. She begged that gendarmes might be sent for his release. She begged that he might be escorted to the station. M. le Commissaire would not refuse? Had he not loved? It was a small thing that he was asked. And her statements could be investigated when the man was before him. The gendarmes had been sent. The man had been brought. And the young lady's behaviour had convinced him that her story was true. But yes—her manner—of a tenderness remarkable! The pair had demanded to be taken to the American Consulate. The man had claimed to be an American citizen. They had been escorted there.

And all the time the *commissaire's* fat fingers had clasped and unclasped themselves, and a soft and reminiscent smile had played over his features. The gaudy parrot on the bush outside emitted a sudden shriek of derision. Captain Keynes's fingers also clasped and unclasped themselves, and his thoughts went for a moment in the direction of the *commissaire's* fat throat. But he mastered himself until the conclusion of the tale, and then bolted out in the direction of the Consulate.

From the Consul he learned that the pair had appeared before him, and had demanded that he should marry them then and there. On his refusing to do so, they had remarked that they couldn't wait, that the ceremony might as well be performed in Frisco, and that, anyway, they had only just time to catch the steamer. They further directed that if any gentleman called to inquire for them, he was to be asked for his blessing.

Captain Keynes listened with a gradually darkening face. He darted to the door, and saw the Frisco steamer well out at sea. Then he raised a bony fist and invoked a comprehensive imprecation on the Papeete police, the Consul, his own eyes, and his daughter. Mr Pickett claimed a special one all to himself.

All the way back to his brig the captain travelled in an orgy of promiscuous profanity. It was not for a good ten minutes that Mr Briggin was able to gather from the incoherent stream of oaths what had actually occurred. When he did so gather it, he too had his say.

It would have been difficult to say whether captain or mate had excelled. Both surpassed themselves.

THE END.

ON WINGS OF FAITH.

A SHADOWY shore, clasped by a vast gray sea,
Its silence deepened by the low, sad cry
Of drowsy waves. Pale ghostly fingers lie
Across the east. Away out ceaselessly
Great surges sing and croon, then break and fall
As they turn landwards in a shower of foam.
Anon from rocks, of shadows deep the home,
The wet-winged sea-gulls start with eerie call,
And flying from the night about them, take
Their lonely wheeling way to meet the dawn.
So, when night keeps her sombre curtains drawn
And the long-looked-for day is slow to break,
E'en like the wild sea-birds to meet the light,
My soul on wings of faith will take its flight.

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

MADRID may soon be one of the cities in the world most favoured by travellers, for interest of nearly every kind and the general advantage of a visit to it; indeed, it has already reached such a stage of consequence. As for many other things in Spain, living and inanimate both, an affection for Madrid is a taste acquired. At the beginning the city seems often disappointing; it presents itself a little stiffly; it is cold and formal—very cold indeed in another sense in months of winter, when a frozen wind beats south from the adjacent Guadarramas, making us shiver even when wrapped in furs, though men and women at home in England fancy us basking in sunny warmth just because this is Spain, and because the mere sweetness of the name, Madrid, seems to tell only of what is pleasant. Madrid is not the real Spanish city, utterly and completely, as it is imagined to be, any more than Paris is solely French, or London is pure England. Madrid, indeed, is less Spanish than those other greater capitals are French and English. The capital of Spain is more cosmopolitan—with an extra touch of French—than any other place in this land of many contrasts; and though it is difficult to select any one city and say of it, 'This is Spanish,' if a choice must be made it would inevitably be Seville, and the difference between Madrid and Seville approaches in extent the difference between New York and Constantinople. But Madrid, as to which other cities in Spain preserve a certain jealousy tinctured with disdain, is, after all, the political and intellectual centre of the nation, and though in a commercial sense it is backward—in comparison with such cities as Barcelona, Bilbao, and some others—it makes no pretence to being good at commerce, but is certainly progressive in other ways. Life here is far intenser than elsewhere in Spain; abundant intellectual effort is manifest; the newspapers and the theatres make a display compared with which that of the other cities is puny; it is the home of archives and treasure-houses. But Madrid, like the Spanish people, is not easy to understand; its merit and attractions are below the surface. Yet once come by some intelligence of the system, the ways and moods, the life of this capital and its people, and its attractiveness increases with a speed. It may be upon the second or a third protracted visit that the true spell of Madrid is felt. In these days I find myself hankering, hungering almost, for a return to Madrid as to no other place I know.

* * *

We assume, of course, that he who thus woos the capital of Spain conforms to the rule of successful travelling, and carries with him some knowledge—of the history, the character, of the people—that with it he may attract some more; that he is one who assimilates well when abroad, for there are some who never do, and for that reason should not leave their local terrain save in the genial company of their friends, to point out and explain to them always, striving for no further intimacy; and that he has a certain familiarity with the language. In Madrid a fair amount of French is spoken, here and there a little English. The educated Spaniard constantly has French at his disposal. A few years ago, upon the first advent of the British queen, it became the fashion to take up English, and one found much of it spoken then; but the queen now speaking Spanish well, and much of the English tongue being neglected in Spanish society, one hears it less than formerly. No wanderer can understand and enjoy Spain without a knowledge of Castilian. A little is better than none; much is not easy to acquire, yet it is worth the study and the hours and the labour. In its first stages Spanish does not seem difficult; and it is a simple thing for one with a gift for languages to translate from the Spanish to the English, guessing being convenient. But after those first stages Spanish is hard, and the Spaniards speak it very rapidly. But be not discouraged. To speak Spanish in Spain is of all linguistic pleasures surely the most delightful and satisfying. And the assimilative traveller will naturally conform to the Spanish customs of this excellent city. Here in the warmer days, or indeed any of them, he will not regard the afternoon siesta with the contempt with which, if reasonably young, he considered it when told of it in England. It is not a matter of laziness in Spain; with the peculiarities of the climate it is a physical necessity. And then, again, it is a custom that seems

 [*All Rights Reserved.*]

somehow to be forced by nature here. It comes from the air and the soil and the spirit of the country. So he who wanders from the islands to the Peninsula will find himself naturally and inevitably taking his siesta, and, taking it, will discover in it rich advantages of which he had not thought before. In the evening he is not weary—he is refreshed for his intellectual pleasures; again, from five o'clock to eight he is in the mood for work, and that is a time often cut to waste at home. I doubt much if on the balance the Spaniard of good intentions loses anything at all in life and work by his siesta; I could be persuaded that he gains. For myself, I know that in Seville, to me the most delightful and stimulating city in the world, I can play more, see and do more, take my siesta in full Sevillian measure, and, with it all, work more and better than at any other place—and so I do.

* * *

Then, with the siesta and the natural following tendency to extend the night, the British ordering of our hours goes much awry. The Spaniard will customarily dine at nine, and the foreign colony also (including British and French), as represented at the two or three big and new hotels which are its chief meeting-places. Some of our people will make a 'high tea' of it, and may leave it at that; and one finds tea being offered as a usual thing at six o'clock or thereabouts at these best places, and commonly sandwiches and other substantial things served with it—all nicely done, and in a French or an English style. Dinner at nine has many advantages, the system of the city being considered; indeed, it is a needful arrangement. At all the theatres there are two performances daily—one in the late afternoon, beginning at about half-past five or six o'clock, and finishing before dinner; and the other opening at a little after ten, and concluding at about half-past one in the morning. The former suits the younger and the older people, or enables one to do the theatre and devote the later period to some social, intellectual, political, or other occupation. To me the system seems most admirable; I rejoice in it, finding I have two evenings to the same day, and that, devoting one of them to what is serious, I can proceed with light heart and conscience not innocent of conceit to something playful, or just laze and dream away the time. The best of Spanish friends has lately dedicated to me his new portrait, with an inscription that it is to 'an honorary Madrilenian,' a compliment I appreciate exceedingly. It is only by the British visitor becoming in spirit an honorary Madrilenian that he may gather from this store of Spain a tittle of the joy that it can yield to him. But, then, he will return once more, and yet again, to Madrid; he must prepare for resistance of a temptation that will surely come to him in time to take up his abode there. And there are always new delights in Madrid. It is never the same; it is continually changing. Madrid at present in almost every way is passing through a remarkable transformation, one more thorough than any city not laid in ruins has ever undergone. Art and literature here are rising in a great renaissance, and the city itself, its veritable stones, its *plazas* and its *calles*, its accommodations and its appointments, are being so much altered that he who lingered here but yester-year and now comes back may ask his friends, the Madrilenians, for Madrid, and may chide them for some magic of illusion that he thinks they play upon him. The tendency is jointly to convenience and magnificence. We have an example of the former in the new underground railway that is now in working, one of the most efficient and also pleasant ever made—and made entirely in Spain—an entrance to its station being opened from the middle of the Puerta del Sol, which may be said to be the true centre of Spain, though the exact geographical point—but still an arbitrary determination—is at that little Angels' Hill out on the plain some twenty miles or so away; while, for example of the other kind, convenience and efficiency joined to it as well, there is the new post-office on one side of the Plaza de Cibeles at the bottom of the Alcalá, which beyond doubt is the finest construction of its kind in the world, and as good in its arrangement and appointments as it is handsome in appearance. So have thought the delegates from the postal administrations of the world, who met there last autumn for the first postal congress that had assembled since the war began. This idea of the transformation of Madrid, with which the new progress of Spain is so intimately associated, leads us on to many reflections.

* * *

It was about a dozen years ago, or thereabouts, that Spanish gentlemen of much and various account, who felt themselves to be most patriotically and otherwise interested, came by the idea of changing the appearance and enhancing the convenience of the capital of Spain. Madrid has always suffered in some essential ways from the circumstance that, for good political reasons, it was an appointed or made capital, in the time of Philip II., and had not the advantage of most other capitals of important states of being, as it were, born to its position, and thereafter establishing a cumulative greatness and impressiveness. Apart from these good political reasons, the selection of Madrid as the seat of government and the heart of future Spanish effort had its disadvantages. This high plateau is for many months of the year a cold, bleak spot, and I have a fancy that Spain would yield up some new improvements of which she is proudest could she but, by some magic piece of

engineering enterprise, destroy those snowy hills of Guadarrama which so much prejudice her climatic surroundings. With the wind from the Guadarramas on an April afternoon I have been cut through with cold, and half-an-hour later, the direction of the breeze having changed, I have sweated with the warmth. It is this swift changeability rather than the actual winter cold, trying as it is with those chill winds, that gives Madrid the worst of characters for its climate; and yet I think at times that it is hardly treated by report, for one spends many pleasant weeks in Madrid, and April and October, without the interference of the adjacent hills, may be extremely pleasant. The *primavera* in Madrid is lovely, with the park, or 'the Retiro,' as it is called, bursting to its new green, and the entire city (especially in those pleasant walks comprising what is known as the Salon del Prado, where the children play, and the Recoletos, a kind of promenade) is awake with a new life corresponding to the sudden intellectual spring that the Madrilenians have acquired. So here is Madrid in permanence as the chief city, and those most concerned, with an excellent divination of the future, felt a few years ago that it was desirable to conduct an extensive series of embellishments and improvements, as a general and well-deliberated scheme such as had never been entered upon before. They hoped to change the looks of their capital from its almost bareness to something even handsome, to make its convenience comparable to that of the most modern and well-found cities. On their awakening from the stupor that followed upon the Cuban War and its disastrous consequences, this was one of their first ambitions, and, as some of the leaders told me about that time or a little later, they desired that the change in Madrid, as they had planned it, might be considered as a token of the new hopes and efforts of the State. They hoped that strangers would here find comfort, convenience, and some intellectual and other delight, and would leave for their foreign homes again with good impressions which might be not without benefit to Spain. This was, indeed, the first step towards the shedding of what we might call the peninsularity of the country, her utter exclusiveness, which now makes the most rapid progress. About the time that these new and original thoughts were born in Spain, the directors and shareholders of the Banco de España—which is the national bank, and conducts many of the Government's financial arrangements, just as the Bank of England does in London—dreamt a dream, and it was that sometime they might have in the cellars of their new and most magnificent banking premises (built on the most majestic scale some thirty years ago, before the aforesaid Cuban War) a matter of a thousand million pesetas in real gold. Both these fancies, the transformation of the capital and the accumulation of the gold, seemed somewhat wild at that time; those who expressed them to me did so with certain hesitations. Only such great believers in the future of Spain as the Count de Romanones—though most of the foremost Spaniards are optimists in this matter—holding that she must break with many honoured traditions even though she should preserve a good conservatism, were convinced. In conversations with me this statesman would listen to nothing of suggested hindrances and objections. The period for the transformation of the city and the collection of the gold, by means of which the economics of the nation might be much assisted, was held roughly in the Spanish mind as about thirty years, dating from about ten years ago or so.

* * *

Both aspirations have already been realised, in about a third of the time that was contemplated originally. The appearance of the capital has been so transformed, and the life in it so quickened, that verily those who only knew it before the war, on making a visit to it now rub their eyes in wonderment, and, as I have suggested, they suspect that in this land, so much less known than it should be, so full of mysteries as still considered, some strange Eastern magic has been at work. More has already been done in some respects than was originally contemplated, but, effort begetting further aspirations, what is accomplished is now looked upon as a mere beginning. And as to the Banco de España, ships that have come in recent years from war-worn countries, laden with golden tribute, have filled the cases in the cellars in the majestic establishment at the foot of the Alcalá to the extent not merely of a thousand million pesetas, as was the dream, but, by this, to roughly two and a half times that amount, or, let us say, with the exchange at par, a little short of a hundred million pounds—a trifle, perhaps, to those who have thought for long in terms and figures of war, but a matter of consequence to Spain and a fine point in economic strength. These achievements, of course, like so much change and transformation everywhere, have been largely due to the Great War. The progressive movement had begun in Spain before the European outbreak, but it was a slow business, and it lacked encouragement. Then, for almost the first time in her new period, Spain began to feel her isolation somewhat acutely, and, as one knows, and had the best reason for knowing, even in 1913 she was contemplating a move of high importance in the field of European politics. Had there been no war, it might well have taken the full thirty years to change the looks of Madrid and to stock the cellars of the bank; perhaps it might have taken more than that. New architectural features of the city, great and strong and good, abound. The old and poor is being destroyed

in the middle parts and many others; something new and splendid takes its place. One hears the sound of hammering and riveting on all sides, for the new constructions are being made of steel. Half-way down the Alcalá, on the left-hand side, the first stage of the new Gran Via opens out, the name of Avenida del Conde de Peñalver being given to this section in recognition of one who had most to do with starting this great enterprise, the beginning of the reconstruction of Madrid. The buildings on each side are highly—but not too highly—decorative in Spanish Renaissance style. They are tall and splendid; they are very good. Banks are among them; there are two clubs, one being the Military and Naval; there are spacious cafés of a kind new to Madrid; and there are the handsomest shops where are offered the best and daintiest things—from Paris, from London, from New York, Berlin, Rome, and elsewhere in the world, from which Spain has been in the habit of making her selection, since she manufactures little for herself that could be offered in such shops. In other parts, as in the old fashionable shopping street, the Carrera de San Jerónimo, there is a transformation of many of the shops, and ladies delight in the discovery of an establishment for perfumes that is something of a wonder to Madrid, quite Parisian in its quality, but all within it made in Spain. The workmen, demolishing and reconstructing, paving with the big cobble-stones which we do not like, but which are necessary in the climate and circumstance, are hard at work upon the second stage of the Gran Via, and this, and the third stage with it, will be completed, it is supposed, within five years from now—less than the time originally contemplated. A new and brilliant way will have been smashed through slums, just as Kingsway was carved in London, and Madrid will possess the street of pride of which she dreamt, such a one as will be remembered with pleasure by the parting stranger. And the city finds, to its satisfaction, that there is money in this business of reconstruction and improvement. Such property as stood here before, and the land with it, were in their existing state of but the smallest value. Optimists then reckoned that when the new Gran Via was in being the ground might be worth even sixty-five pesetas a foot; realists told them scornfully that they, Spaniards, were raising those airy castles in Spain of which there was so much talk abroad! And the truth is that at the present time that ground is being sold at from eighty to a hundred pesetas a foot. The success of this first enterprise in demolition and reconstruction has led to some thinking and to new plans and schemes. The authorities have it in mind to make a splendid smash of nearly all the middle of Madrid surrounding the Puerta del Sol, and build it new again. Plans in accordance with this idea are even now being prepared. Recently Don Antonio Palacios, chief architect of Spain, designer of the Palacio de Correos, some of the grandest new banks, and most of the majestic buildings that are rising in the capital now, by request submitted a scheme in this connection to the municipal council; and one day, while we stood on the roof of his house in the centre and highest part of Madrid and talked of the wonders of transformation as we gazed upon them, he showed me the plans and explained them. They are wonderful. It had hardly seemed that such idealism in convenience and advantage could be achieved in Spain as here contemplated; certainly the Americans, who are peculiarly good in this way, do nothing like it in their new town constructions. But, then, there is the Spanish imagination to be considered here. And the result pecuniary of thus achieving an ideal of convenience, elegance, and health would be a net gain to the authorities of Madrid of forty-four million pesetas through rise in the value of the land. Thus is business combined with pleasure.

* * *

It was a sunny afternoon when I talked upon the future Madrid with this man who was making most of it, and we saw the process down below under our very eyes. The city glistened. The Recoletos made a bright band of the new green of the *primavera*, and the outlying country, not generally beautiful, had a present charm with its delicate blues and grays of distances. From the mass of masonry the Palacio de Correos (the Post-Office, you remember) and the Rio de la Plata Bank stood out prominently in one direction. It was curious that the bank seemed to vie for prominence with all the rest, and not to be beaten either. Its huge Corinthian columns rose in majesty, and the *atico*, which rests upon the massive square block, seemed like the lid of a gigantic and beautiful box. 'That is rather interesting in a way,' said Don Antonio to me, 'for in the case of that bank I had a peculiar problem to solve. As you see, it stands across the *plaza* almost opposite to the new Palacio de Correos, which was built in advance of it, obviously challenging comparison with any other architecture in the neighbourhood, and challenging it fearlessly. But the new banks of Madrid are being constructed as very fine buildings, and the owners of this one did not desire that their new construction should be completely dwarfed by any others. A difficulty, however, was that they had but a small piece of land on which to build it, and no more was obtainable upon this site in the Alcalá at the corner of the Barquillo—just a thousand square metres. The ground occupied by the Palacio de Correos is twelve times as extensive as that of the bank, but my building was to bear a certain comparison. You see it!' It sustains the comparison with credit. In the

bird's-eye-view of Madrid this stands out boldly from all about, a splendid building in the neo-Grecian style, with marvellous Corinthian columns all round it that cost seventy thousand pesetas each. And this master-architect of Spain spoke with me upon the principles that underlay some features of the reconstruction of Madrid. There is an artistic idea and a system running through it all; in this architectural work there is more definite artistic aim, as it seems to me, than in anything of the kind I have seen in any country where much building is proceeding now. The Americans are raising magnificent public buildings, which will be a glory to the country when time has a little mellowed them. Their style mostly is one of simplicity and strength. We see everywhere the plain Grecian, with fine Corinthian columns. It is good work, solid, strong, impressive. The Spaniards labour more delicately with their new constructions, as one might expect them to do, and their style is more fitted for an old country like theirs, with all its temperament, its manner, and artistic fineness. The stuff is good, but it is highly decorative; my only fear is that sometimes, as in the Gran Via, there might even be a tendency a little too much towards the florid. But in the friendly critic's less anxious and captious moods he fears not so. It is the general artistic system, the cohesive design, that pleases us; in England, in London, we seem to build anyhow, splendidly at times, but with little thought for harmonies, and we have no modern style—merely pick in pieces from here and there among the ages, confessing always that we have no personal thoughts as the ancients had. They are making a new style in Madrid; our friend, the chief architect, spoke of it. 'We do not follow any one particular model of the past,' said he to me. 'Why should we do so? We are virtually building a new city, and is creative art so poor in Spain that we are obliged to copy, and do nothing more than copy? In a sense nothing is new; all the schools and models of the past are influences, and must always be so, and those influences vary according to the circumstances of the recipient. In our present case we effect a new style, the modern Spanish, but that is based on the style of the Spanish Renaissance; and, again, we are always and strongly under the Moorish influence. Thus it happens that on our new buildings you may discover many items here and there taken from other styles, but welded into such a harmonious whole and with such a sense of art as to constitute, if not a new style, at least one which cannot otherwise be named. The Gothic has its influence, as in the decorated points of the towers. For an example of method, I took the little windows high up in the Palacio de Correos from the Monterey palace at Salamanca.' In the simple recital of a part of this conversation there is evidence of the new spirit of Madrid and of Spain.

BATHING AND OTHER ACCIDENTS.

By Lieutenant-Colonel Sir HENRY SMITH, K.C.B.

I.

SINCE my article on 'Shooting Accidents' appeared in *Chambers's Journal* for August 1920, it has occurred to me that possibly accidents unconnected with shooting might also be of interest to readers of the *Journal*.

Without further preface. More than half-a-century ago, when I was a boy of ten or twelve years of age, there lived in George Square, Edinburgh, a family consisting of two brothers, John and James (usually designated as 'Jimmy'), and three daughters—one, Jane, a very beautiful girl. John and James both belonged to the Society of Writers to Her Majesty's Signet, most of whom were then, and many of whom are now, men of landed property; in the case of the family in question the property was in Berwickshire.

The two brothers, in their likes and dislikes, were wide asunder as the Poles. John was a pronounced Liberal of the Gladstonian type—but enough; politics are eschewed so far as this article is concerned. He had no inclination for sport—fishing, shooting, or hunting. Quill-driving was his only delight. The firm had in its service six or eight boys as clerks, whose life was not a pleasant one. Their office-hours were from 10 A.M. to 4 P.M., and—oh, relic of barbarism!—from 7 to 9 in the evening. John would dine at six o'clock, walk down from his house to Thistle Street, and straightway commence writing letter after letter—there was no such thing as a copying-press in those prehistoric days—which the boys, half-asleep on their long stools, had to copy. Sometimes, when clients were importunate for replies, John would write till midnight, tell the boys they might go home, and lock up the office himself; walk home, drink a glass of water from the pump, and go to bed, to get up in the morning and resume work. This would go on for six days in the week—Sunday was held sacred; John was a regular church-goer.

Jimmy, on the contrary, took life pleasantly, was a welcome guest at lunch or dinner, thought Burgundy or whisky and soda preferable to pump-water, and when he met a rabid abstainer like

the late John Hope (who poured all the contents of a large cellar, bottle after bottle, down the sink—*fact!*), gave him as wide a berth as possible.

Jimmy was also a first-class horseman, an ardent angler, and a splendid shot.

In those days I belonged to a club in Princes Street, Edinburgh, called 'The New Club'—rather a misnomer now, for it is one of the oldest clubs in Great Britain. Of this club Jimmy also was a member, and here one beautiful day in August—thirty-three long years ago—we met and had lunch together. He was in exuberant spirits. 'Lord ——,' he told me, 'has appointed me factor on one of his estates, and I am going over to begin my work next week. The factor's house is a capital one, and I am to have as many clerks as I require. From what I have heard, three, I think, will be sufficient. You must come over and stay with me—I can easily put you up. I have two spare bedrooms. There is also a boat belonging to the estate, which only Lord ——'s guests or friends staying with me have a right to use. We can run her out and have a grand swim.'

Poor Jimmy! How little he thought that boat would be his undoing! How little he thought that within a fortnight he would have crossed that river which all of us must eventually cross! Before I was able to pay my promised visit the tragedy occurred. Jimmy, taking one of his clerks with him, embarked in the boat and rowed over—some two hundred yards from the pier—to a sandbank. Both undressed, jumped out of the boat, and fearing she might get adrift while they were bathing, took particular care to run her as far up the sandbank as possible. Having finished this satisfactorily, they had their swim. The next thing to do was to get the boat afloat again; but, notwithstanding their utmost efforts, they failed to move her. Fully alive to their danger—it was a tidal river—they cast their eyes round, hoping for assistance, when suddenly, to their intense relief, they descried a steamer making its way up the river. She was actually within hailing distance—say, within one hundred or one hundred and twenty yards. Waving their shirts frantically, they called for help. They were both seen and heard, and were answered from the vessel; but passengers and crew thought they were larking (this was ascertained next day), and the steamer proceeded on her way, leaving them to their fate!

When neither the new factor nor his clerk came home, the servants became alarmed, and rushing down, launched a boat and made for the sandbank.

Needless to say, they were too late.

Both the unfortunate bathers were drowned, and the would-be rescuers had great difficulty in detaching their hands from the gunwale, so desperate had been their efforts to get the boat afloat.

II.

I have often noticed that men who have spent many years in India are very proficient in the art of swimming. The reason is not far to seek. Most 'compounds,' especially up-country, contain a large swimming-bath. Where there is an extensive establishment of the kind—probably twenty yards in length by, say, half as much in breadth—the proprietor, after playing tennis or racquets or polo, dives in and enjoys a long swim, and getting cooled, sleeps soundly till the morning. Some of his neighbours, less fortunate, without baths of their own, are often invited to join him in his swim. The arrangements, in fact, are perfect, and ensure for both host and guests a pleasant and invigorating ending to the day. Water is plentiful in many parts, and the bath is emptied generally every evening and refilled with pure cold water fresh from the springs on the hills. A native attendant sees to this, and used to see also to lighting the gas-jets (doubtless long ere this superseded by electric lights) to enable bathers to see their way.

In one of the largest compounds there resided, many years ago, a civilian (the civilians were the great men of the country in those days; they were better paid than, and took precedence of, officers of the H.E.I.C.S.), a most courteous and popular man, beloved and respected by all. One evening his bath-attendant ran the water off, but omitted to light the gas-jets, thinking, as he confessed afterwards, that the *sahib* would not return for some hours. But, unfortunately, the *sahib*, for some reason or other—what it was no one knew, and no one could discover—returned long before he was expected. Undressing at once, he opened the bathroom door. Dark as pitch! What did it matter? To turn on the gas-jets would take time, and he was longing for his swim. What the poor fellow thought or did can only be conjectured. He was scarcely three or four yards from the near-end of the bath and the board, fixed on a spring, from which bathers plunged. The attendant, entering some time afterwards, was horrified to find his *sahib*—to whom he was sincerely attached—lying on the concrete floor, his skull fractured and his neck broken. Mercifully, death must have been instantaneous.

The tragic fate of this popular man created widespread consternation from Calcutta to Peshawar, and the deepest and most sincere sympathy was felt for his poor widow.

III.

More than fifty years ago, at the Junior Carlton Club, Pall Mall, there occurred a dreadful accident, by which one of the members lost his life. On a certain night four men were playing billiards, and having finished their game,

were standing talking at the top of the stairs before leaving for home. 'What will you bet,' said one of them, 'that I don't jump down to the first landing'—some two-and-twenty steps—'at one jump?' 'A sovereign,' answered one of his friends. The rail, made higher after the accident, was then very low, and the tendency for a man jumping would be to the left. In this case, unfortunately, it proved so, for, swinging right over the rail, he fell with a terrible crash, some forty or fifty feet, lighting on the top of a weighing-machine. Providentially there was no one on it, but a waiter stood hard by. Looking up, the *dead* man exclaimed, 'I've got well out of that,' falling instantaneously a corpse on the marble floor. In 'Shooting Accidents' I mentioned two cases in which, after being killed—however impossible it may appear—the deceased had spoken plainly, and here we have a third.

There are two or three members of the club still alive who, if appealed to, could testify to the truth of this incident.

IV.

About the year 1852—if my memory serves me right—there was founded in Edinburgh the 'Saint Andrew Boat Club,' nicknamed the 'Gallows Club,' because some mendacious individual asserted that every man who joined it found his way eventually to the halter. The original members were few in number. Suffice it to say that Frederick Pitman—three of whose sons attained great distinction in the rowing world, and represented both Oxford and Cambridge in the University Boat Race—and John Craufurd Tait, son of Sheriff Tait—afterwards renowned as having introduced the game of Polo into Great Britain—were the life and spirit of the club.

The headquarters of this aquatic fraternity were at Fountainbridge, near the Grange Cricket-Ground, and consisted of two small rooms and a long shed, in which the boats—four-oars, pair-oars, and skiffs—were housed. The club also rented a large room at Hermiston, with kitchen attached, where members were in the habit of dining, sometimes as often as three or four times a week in the season—that is, during the months of May, June, and July, when the weather was (or ought to have been) warm. An old Scotsman whom I met at Harrogate—that lovely, but distinctly cold, place—was asked, in my hearing, by a man who had never been farther north than Berwick-on-Tweed, what the climate of Scotland was like. 'Weel,' said the veteran, 'it's jist nine months o' wunter and three o' damned bad weather.'

Pardon the digression, and let us return to Hermiston—for it was there that the terrible accident which I am going to describe occurred.

I should mention that members wishing to dine at Hermiston used to meet at 'The Four Lamps,' now 'The West End,' at five o'clock, hire a cab, proceed to a butcher's shop, to a fishmonger's, to a fruiterer's, &c., and having collected materials for a good dinner, drive out to Fountainbridge, launch a four-oar, big in the beam, put what was destined to be dinner aboard, and row out leisurely to Hermiston—another four-oar, a much faster boat, reaching Hermiston in time for the new arrivals to lay the cloth and help in the cooking. On a certain evening—a beautiful warm evening it was—there was a large party assembled. Some, recognising the danger of a journey by water and the occasional 'larking' incidental thereto, had driven out. After a good dinner, washed down by a proportionate quantity of drink—cold punch (Mr Pickwick's favourite tipple) being in great request—the fun got fast and furious. Taking headers into the canal and swimming about for some minutes was popular with most.

And now, with reluctance, I approach the accident to Jack M., my most intimate friend (in those days we were inseparable), who was, I can say without exaggeration, the champion athlete of Scotland: a splendid swimmer, a splendid racquets-player, a splendid shot, a splendid dancer. But it was cricket he loved most of all, and at that he was most proficient. Had there been at that time in Scotland, as there were at Eton and Harrow, professionals to coach the boys, Jack would have equalled or possibly surpassed 'W. G.' himself.

On the evening of the accident something or somebody detained me in Edinburgh and prevented my dining at Hermiston; but I had an account next morning of what happened. Jack, in taking a header into the canal, must have slipped, for, instead of lighting well out from the bank in deep water, he lighted close in—where the water was not a foot and a half deep. Two men, looking down, saw him lying, and took hold of him. 'Don't let go of me,' he said. 'I 've lost the use of my legs.' Lifting the poor fellow carefully up, they rubbed him dry, rolled him in blankets warmed at the fire, and carried him to a cab—luckily there was one—and drove him home to the Royal Circus. What a home-coming! Two or three hours before in buoyant spirits, vigorous, and athletic—now disconsolate, helpless, and inert. Next morning early a friend who had witnessed the accident called on me. 'I 'll go down at once and see him,' I said. 'They won't let you in.' 'I think they will.' Jack, his sister told me, on hearing I had called, wished to see me. 'Well, Henry,' he exclaimed, 'here I lie—a living head on a dead body!' Controlling my feelings as best I could, I said some cheering words. 'Now, when you get up, Jack, the first letter you write you will write to me—promise;'

and he promised. I turned to the door. He looked wistfully after me. Well I knew I should never see him again. I had to go to London next day on important business. Jack lingered for two or three days, losing consciousness as the end was approaching. His sad fate caused poignant grief to his innumerable friends.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER II.—*continued.*

VIII.

THERE was a moment of deep silence in the cabin after the definite and cruel accusation was made. Clement swept the little crowd with a glance he strove to make amazed. He finished up at the captain, who stood, moody and puzzled, near the cabin door.

'I have been accused of theft! I am to be searched!' he cried. 'My dear Heavy, this is absurd, monstrous!'

'I know! I know! I've said that already. This la—they've taken the matter into their own hands.'

'But to be searched! The idea is infamous.'

'You can refuse,' said Heavy, 'and await—er—the authorities.'

'And I stay here,' said the lady, like a figure of vengeance, 'until the authorities come. I am *not* going to lose my tiara.'

'You'd scarcely do that, madam,' said the captain soothingly. 'Even—even if Mr Seadon had it, he could scarcely get rid of it now. If he tried to get rid of it through his port-hole, people would see him. We're alongside, you see. And, in any case, his port-hole is shut.'

Seadon, with a start, darted a glance to the port-hole. Heavy's remarks had closed that loophole pretty thoroughly, he thought.

'All the same, I stay,' said the lady implacably. 'Unless, of course, Mr Seadon allows us to search.'

'If we're alongside, sir, shall I signal the police?' asked the evil-looking little steward.

'Is this the man who accused me?' Clement asked sharply; and as the captain nodded, 'What's the reason behind this charge?' he demanded cuttingly of the fellow.

'Reason be'ind it?' snarled the man. 'Ain't no reason be'ind it. It's just that when Mrs Smot said she lorst 'er dimend terara—well, I rec'lected I'd seen *you* 'angin' about suspicious-like, comin' out of 'er cabin where an' when you 'ad no right to be there.'

'And how is it you saw me come out of this lady's cabin?'

''Ow? 'Ow? Strewth! ain't I 'er cabin steward?'

'Oh, you're her cabin steward. You're the one who has the *entrée* to her cabin.—What's the record of this man, Heavy?' Seadon rapped out the sentences with a fighting air, obviously trying to parry suspicion.

'Don't know,' answered Heavy, who was feeling that it was rather stupid of Seadon to act like this, when a search, distasteful though it might be, would clear him at once. Of course, he thought Seadon knew nothing about the tiara. He did not realise the grim facts that were making the young man act so strangely. 'Don't know. He only signed on this voyage; we don't know anything about him.'

'If you think you c'n switch it off ter me,' said the steward, with an evil grin, 'lemme tell you *I* don't mind being searched, anyhow.'

'Oh,' said Clement, catching his breath.

'Yes,' said the lady acidly. 'I don't see why any man, if he *is* innocent, should object to being searched.'

Clement acknowledged that he could fence off the evil moment no longer. He turned to the captain with a resigned air. 'There are my bags,' he said. 'I haven't been in the baggage-room since I came aboard, as your baggage-master can testify. If that tiara is anywhere, it is in one of my suit-cases.' He pointedly drew attention to his suit-cases. He noted that the steward marked this fact. For, though the steward searched the suit-cases with great cunning, starting first on the one he had *not* put the tiara into, so as to hide his own knowledge, he seemed to have something on his mind.

It was very definitely on the steward's mind after he had drawn blank in the suit-cases, had drawn blank in his careful examination of the cabin, and had reassured himself that the port-hole had been locked since the morning.

He stood up, studying Clement with his lowering and evil eyes, and said, 'No, it ain't anywhere 'ere. Not in the suit-cases or anywheres. There's only 'imself.'

'You seem curiously anxious to fix suspicion on me,' said Clement sharply. 'To divert it, I might say.'

'Well, there's nowhere else, is there?' snapped the man.

'Captain Heavy,' said Clement, with an anger that must affect the captain, 'is this to go on? Am I to submit to this outrage any longer? Is this man to fix suspicion on me for some reason of his own, for his own ends?'

'I don't want ter search 'im, if 'e don't want it. There's always th' police,' said the steward.

Clement turned swiftly to the captain. He held his arms out straight. 'Please search me, captain,' he said savagely.

Captain Heavy, with a little shrug, and an 'I wish this was merely a joke, old man,' searched Clement. He did the job in the Scotland Yard manner. As a search it left nothing to the imagination. It probed into places that even Clement could not have thought of on the spur of the moment. It was complete; it was brilliantly thorough. When he had finished, Captain Heavy stepped back and stared at the steward. He also stared at the lady. And he said bitterly, 'Well?'

The lady's face showed that apoplectical tint that may come to even the best-nourished woman when she is torn by the two powerful but contrary emotions, those of grovelling apology, and of anger with a steward who has made her look a fool.

The steward—well, the steward simply goggled at Clement. There was incredulity and also fear showing in his aghast, his devastated, countenance. He had crowded up close to Clement while the search went on. He had been ready to pounce at the first glitter of a diamond. He had been ready to suggest some hiding-place overlooked by the captain. He was sure that the tiara must be on Clement's person, since it was not in his suit-case—where it should have been, where he himself had put it.

But he did not pounce. He could not point to any possible hiding-place the captain had overlooked. Nothing had been overlooked, and nothing had been found. Nothing!

Captain Heavy glared at him, and snapped, 'Well, my man, what have you got to say? You've subjected a passenger on *my* ship to a disgusting indignity—for what?'

'It—it must be on 'im,' said the steward, sullenly backing away, his mind absolutely bewildered by the unexpected absence of the tiara.

'Must!' thundered the captain. 'Good God, man! do you want me to take his skin off? That's the only thing left to do.'

'Well, 'e 'as it. Didn't I see 'im 'angin' about'——

'We'll get to the bottom of this. As I knew, Mr Seadon did *not* take that tiara. Why the devil did you accuse him? I want to know that. And now.'

'I think,' said Clement in a cold voice—'I think I have already suggested why.'

'Eh, Seadon? You suggested? What did you suggest, my good chap?' cried the captain, only too anxious, for the good of his service, to make amends.

'I suggested that he was anxious to fix suspicion on some one—some one other than himself.'

'Yes—to divert suspicion. That's it. That's what you said,' snapped the lady, who not only had a natural instinct for finding scapegoats, but who owed the steward something for making her appear so conspicuously foolish.

'Ah, divert suspicion,' said the captain, swinging round on the steward, and appreciating his substantial air of villainy for the first time. 'I see. You are this lady's cabin steward, and'——

Clement might have helped the good work along. There was no need. The lady was only too anxious to help the good work along herself.

'And he had the run of my cabin,' she piped. '*He* could go in there whenever he liked, do what he liked, *take* what he liked.'

'I never,' snarled the steward, cringing back, glaring hate at Clement. He felt that this softy-looking young man had turned the tables on him in some way. He was a little afraid. But more; he resented the fact that this 'dandy feller,' who looked the last person to possess brains in good working order, should be tying him in such a knot. As his wits darted back over the happenings and the talk in that cabin during the last few minutes, he saw, blazingly, that its apparent casualness had really been a net to entangle him. In a desperate effort to beat the brain working against him, he cried, 'I never took nuthin'. If I 'ad, would I 'ave pushed meself forward in this—brought meself inter the limelight? I risked sumthin' accusing *'im*, though it was me duty.'

Clement might have said something. There was no need. He never believed in doing work others could do better. The incensed lady did it much better. She cried, 'That was only your vile cunning. Of course it was. My tiara is missing—who would be the first person I should accuse? The cabin steward — naturally. And naturally my cabin steward would know it. If he wasn't a thief, it wouldn't matter. If he was—well, he'd do his best to divert suspicion, as Mr Sneezedon'——

'Seadon,' from Heavy.

She turned on the steward—'Seadon said. Oh, I see it. You suggested some one I did not know, on the other side of the ship, to lead me away. 'You joined furiously in the search, so that I should be convinced that you, at least, were honest. Oh, I see it. I see it. You pretended to be honest to cover up your guilt.'

'Guilt! Cut out the guilt. I *ain't* guilty,' snarled the steward, backing farther away, and watching Clement all the time. What had this man who looked so insignificant, and wasn't, up his sleeve? 'I didn't take that terara.' He made another desperate effort in defence. 'An' —an' why should I pick on this gentleman 'ere, of all the passengers? Why?'

Clement cut in like a flash. This was his time to speak. 'Because at the very beginning of the voyage I kicked you out of this cabin—since you were in it, and had no right to be in

it. Because you tampered with my private papers during the voyage, and you know I know it, and want either to prejudice beforehand any report I may make, or to get me out of the way. Isn't that true?'

'My God!' jerked out the man at the mention of the papers; ''ow did you know that? . . . I mean, I never did.' He stared at Clement, his face working. If the gang had utilised that stolen letter with great effect against Clement, he had turned their own weapon against them with dismaying force. The mere mention of it had staggered the steward. Already convicted of theft out of his own mouth, the steward was at a loss. It was Captain Heavy who acted next. He rang the cabin bell imperiously. When Clement's own steward, Nicholson, answered, he snapped, 'Nicholson, have this man's effects searched—at *once*. Make it a thorough search. A diamond tiara is missing. This fellow has accused Mr Clement Seadon of taking it.' Nicholson regarded the evil-faced steward with a sudden glance in which benevolence was conspicuously absent. He knew Mr Clement Seadon. Also, Captain Heavy knew he knew Mr Clement Seadon. 'It's more than likely that he has merely accused Mr Seadon in order to distract attention from himself. Get to it.'

Nicholson got to it. With another unbrotherly glance at the steward, he nipped out of the cabin and sped towards the 'glory-hole.' The evil-faced lad attempted an air of insouciance. He even called after Nicholson, 'Search 'ard, me bucky. I've already expressed me willingness.'

His effort, like his tone, however, was not as assured as he wanted it to be. He knew anxiety, and he showed it. This simple-looking young man had been too surprising for him. He did not know what was in store for him. He feared the worst. And those about him saw the emotion in his face—and formed their own conclusions.

The lady who had been so ready to accuse proved herself more than ready to apologise. Her method of apology was lavish, but particularly unsatisfactory to the evil-faced steward. It was one long hymn of hate concerning the steward. His feelings grew more and more disturbed as the minutes passed.

He was confident it was all right. It was bound to be all right, he told himself. He'd been most careful. Nothing could go wrong with him. Nothing—or, anyhow, he thought nothing could go wrong with him. As things stood he was all right. He saw no reason for feeling scared; but——

Nicholson came into the cabin.

Nicholson looked wisely at Clement, with resignation at his superior officer, with a certain touch of cheeriness at the evil-faced steward.

He lifted his right hand. He opened it. Something flamed and flashed.

'My tiara!' screamed the lady.

'In the pocket of this,' said Nicholson, lifting up a steward's white jacket.

'My coat—my oath!' blurted the evil-faced steward.

There was no doubt about it. That dirty coat with its yellow stain—probably rust—on its arm and shoulder was unmistakable. Everybody recognised it. Clement Seadon had never forgotten it, in fact.

'A cunnin' hiding-place,' said Nicholson. 'Hunted all through his—his effects, as ordered. Nothing finding. Never thought of looking in his coat. Never would have thought. Only we see it hanging in the "glory-hole."'

That was where Clement Seadon had seen it hanging last—in the 'glory-hole,' when he had dodged in there for cover. He smiled.

'My oath!' burst out the evil-faced steward, seeing that smile. 'My oath—in my coat-pocket! *You* put it there.' He stared at Clement in hate.

Clement's smile was even sweeter. 'Of course I put it there.' And only he and the steward knew that he was telling the truth. The others merely appreciated his sarcasm.

'That settles that,' said Captain Heavy.—'Nicholson, take this brute out, and keep him safe until the police come aboard.—Seadon, I can't tell you how mad I am that all this has happened. It's absolutely infamous. If it's any consolation, I'll promise you that this scoundrel will be made to suffer in full.'

But the rest doesn't matter. Nor do the voluble apologies of the lady of the tiara matter. All that matters is that Clement Seadon left the *Empress* for the Château Frontenac just about the time that the police went on board her to arrest the steward and convey him to prison.

And in the lobby of the Château Frontenac the first person he saw was the mountain of a man—Mr Neuburg.

Mr Neuburg was standing facing the door, and he started perceptibly as Clement came into the hotel. He betrayed himself by a quick stride forward and a muttered oath.

Clement smiled. He said cheerfully, 'Oh, were you expecting the other fellow? Sorry. He took my place—at the last minute. You'll know where to find him, I think—or, anyhow, the first *policeman* will direct you.'

The mountain of a man stared across Clement's shoulder for a moment. In his usually placid eye there was a red light, a light of rage. He stared. His hand, with fist clenching, lifted to the level of his ribs. He gulped. He turned, without a word. Without another sign he swung round, went with his surprising swiftness out of the lobby.

(*Continued on page 152.*)

ANOTHER AGADIR AFFAIRE.

By 'SIRIUS.'

I WAS serving in a 'Q' ship at the time, and the activity of enemy submarines in the vicinity of the Canaries and Madeira had resulted in our hurried departure from a patrol on the south coast of Ireland to Gibraltar, there to wait orders from the Admiralty.

'Awaiting orders' in the days of war was a somewhat different proposition from the 'pre' and 'post' war conception of the term. In those far-off, and these reactionary, days it might mean anything from five days to five months. In the year of our Lord nineteen hundred and seventeen it meant steam up in all boilers, limited or no leave to officers and men, and an expression of strained expectancy on the countenances of all hands, from captain to cook's-mate.

As a result our stay in Gibraltar was not exactly a rest cure, and the Reina Cristina (with casino adjoining) at Algeciras profited little, if anything, by the presence of one of His Majesty's 'Q' ships in Gibraltar. We were, as a matter of fact, too fully occupied with laying in stores, overhauling machinery, and attending to little details of our disguise to worry much about the delights of the shore.

Two days after our arrival a British submarine slipped unobtrusively into harbour. She had done a modest little trip of a thousand odd miles from England, had been attacked once by our own trawlers, nearly rammed twice by merchant-ships, and had survived a very thorough westerly gale in the Bay of Biscay. 'Otherwise we had an excellent run,' remarked her philosophical lieutenant-commander in command.

This officer being a personal friend of mine, we naturally compared notes, and a certain similarity in our sailing-orders aroused joint suspicions (and hopes) that we were bent on the same errand. As an example of nautical brevity these instructions were admirable. 'Being in all respects ready for sea, you are to proceed to Gibraltar, there to wait orders,' they ran.

Both suspicions and hopes were confirmed when we were summoned to the office of the rear-admiral in command, who gave us the following verbal instructions.

The 'Q' ship, in the disguise of an inoffensive Spanish merchantman, was to patrol in the neighbourhood of the Canaries and Madeira. She was, if possible, to do some 'Fritz-strafing' on her own account. But she was also to supply the submarine with such information and supplies as might be necessary to enable the latter to render a good account of her stewardship to an anxious British public—such account to be rendered only on the expiration of the war: during the war we did not talk much about these things.

In point of painful fact, neither of us sighted a submarine the whole time; but that has nothing to do with my tale, which seeks to show only how near the 'Q' ship came to jeopardising the Anglo-French alliance. And the innocent cause of it all was a baby wild boar! Having now reduced the reader to a state of utter bewilderment, let me hasten to unfold the drama—or should I write tragi-comedy?

For the purpose of communicating with each other, it was necessary to arrange a rendezvous at one or more places where sufficient lee would be obtainable (out of the sight of prying, and possibly Teutonic, eyes) to enable the necessary transfer of fresh bread, salt pork, crude oil, and verbal information to be carried out.

The two rendezvous selected were the Salvage Islands, situated south of Madeira, and the roadstead of the famous Agadir, scene of another historic incident not unconnected with Germany. If the former was unsuitable owing to weather conditions, both vessels were to repair to Agadir, where fair shelter would usually be obtainable.

To which end the French commandant at the latter port was warned not to display undue surprise if a Spanish merchantman and a British submarine forgathered beneath the guns of the fortress of this old seaport-town.

Of course, the inevitable happened. The submarine considered weather conditions favourable for a rendezvous off the Salvage Islands. A council of war on board the 'Q' ship simultaneously decided that Agadir was the more suitable port in the north-easterly wind which was then prevailing. Secrecy being imperative, there could be no question of an exchange of views by wireless telegraphy.

And the sad result of this divergence of views was that we in the parent ship found ourselves waiting patiently and philosophically at Agadir, whilst thirty officers and men of the submarine wore out their eyes and temper off the Salvage Islands, scanning the horizon for their unnatural mother.

Meanwhile international courtesy at Agadir dictated an exchange of visits between the French commandant and the 'Q' ship captain. These formalities being duly completed, the commandant showed us great hospitality, and many a cheery hour was spent in his company. We in the 'Q' ship did our best with such poor facilities as our ship possessed to return his kindness.

Thus passed, pleasantly enough, several days,

though it must be confessed our pleasures were tinged with a little anxiety as to the fate of our friends in the submarine. This was relieved, however, by the receipt of a telegram to say that, acting on the orders of the senior naval officer, she had returned to Gibraltar. Remained, therefore, nothing for us to do but to follow suit, and we arranged to sail at 9 A.M. on the morning following the receipt of this news.

At 8.30 A.M., what time preparations were being made to weigh anchor, the signalman reported a boat approaching the ship. It was pulled by natives in picturesque costumes, and as it drew near its stern-sheets revealed the cheery personality of our friend the commandant, who had come to bid us *bon voyage*.

It likewise contained the *fons et origo mali*, in the body of a young boar of a particularly fierce disposition. This was a parting gift from the commandant to his British friends, and although it was presumably intended to be fattened for the wardroom table, there seemed to be no reason why it should not be kept alive as a souvenir of our visit. If it proved unsuitable as a pet, the London Zoo would doubtless welcome it with (figuratively speaking, of course) open arms. The commandant was warmly thanked for his kindness, and the unfortunate little beast was consigned to a hencoop until such time as a more suitable place of abode could be found. Then followed expressions of mutual goodwill and friendship, and in due course the commandant bade us farewell and embarked in his boat.

A volunteer was then called for to undertake the care of our strange pet, and no difficulty was experienced in making a choice. The qualifications of the man selected were indisputable: he had an uncle who tended the lions in Sanger's Circus. The taming of wild animals, he asserted, came naturally to him; it was in the blood.

I asked this genius how he proposed to commence the training of Ernest (for some occult reason the animal had already been given this rather inapt name). 'Well, sir,' he replied, 'I think if we was to let 'im out o' the 'encoop and leave 'im to run about the upper deck, 'e 'd soon get 'is sea-legs and see 'oo 'is friends was.'

I had my doubts as to whether Ernest would ever be sufficiently educated to discriminate between those who might be considered his friends and those who might not; so far he had displayed marked hostility to all and sundry. But who was I to contest the superior knowledge of the nephew of a lion-tamer? Moreover, I was busy poring over the chart and plotting out a course which might possibly bring us in contact with an enemy submarine.

'Go ahead,' I said briefly, and resumed my calculations. We were by this time moving slowly out of the harbour, and the ship was just beginning to feel the effects of a heavy Atlantic swell. Hardly had I settled down to work when I was rudely interrupted by a loud hail from the after look-out.

'Pig overboard, sir,' he bawled.

And, alas! it was only too true. Our lion-taming expert had opened the hencoop with a view to giving Ernest his sea-legs and full facilities for selecting his friends. Ernest displayed no hesitation whatsoever. Emerging forthwith from his retirement, he stood for a few seconds gazing in bewilderment at his novel surroundings, as if undecided what exactly to do or whom to tackle first. His indecision proved his undoing, for during these few seconds the ship gave a heavy roll, and Ernest, like the Gadarene swine of old, ran violently down a steep place into the sea.

The look-out's cry caused me to rush to the side of the bridge, and there my horrified eyes caught sight of Ernest swimming for dear life back to Agadir. I had heard that a pig cuts its throat when it tries to swim. Ernest disproved this assertion once and for all. He was laying an exact course for the commandant's office by the water's edge, and he was swimming with the most unexampled vigour.

I had visions of his landing, exhausted and bedraggled, at the commandant's feet, and of an insulted ally vowing vengeance on perfidious Albion, whose representative had spurned his proffered gift. Really the whole Allied cause appeared to hang on the recovery of Ernest, dead or alive. Instant action was imperative if the situation was to be saved, and a moment later the engines were set to 'Full speed astern,' whilst the bosun's-mate was roaring 'Away lifeboat's crew' all along the upper deck. There was no lack of volunteers—the men tumbled over themselves in their eagerness to secure a place in the boat. It is not given to the British bluejacket every day to take part in a species of nautical pig-sticking.

In less time than it takes to write these words the boat was in the water, and the chase had commenced. The bowman, armed with a boat-hook, was balancing precariously in the bows of the boat, the lust of the chase clearly depicted in his features; the coxswain, cool and collected, was urging his excited crew to fiercer efforts.

Everything promised well for the running to earth (if I may use the absurd idiom) of our quarry before he was in a condition to do irreparable harm to the Allied cause.

Suddenly there was a swift movement in the water. The anxious watchers caught a glimpse of a gleaming white object and a triangular fin which showed for one instant above the surface. A moment later Ernest had disappeared, and a small patch of reddish-coloured water marked the end of what had threatened to be another Agadir *affaire*.

THE MONTH: SCIENCE AND ARTS.

AN INEXPENSIVE WASHING-MACHINE.

IN an increasingly large number of homes the work of washing is now being done by means of machines. Some of these are elaborate and expensive; but one has recently come under our notice which, besides being cheap, is simple and reliable in action. The 'wash-tub' consists of a rectangular oblong wooden box, mounted at a convenient height on four legs, fluted in the interior along the bottom and the sides, and furnished with rollers at each end. Fitting across the middle of the box is a detachable 'propeller,' as it is called, consisting of a number of rollers set in a frame, which is provided with a long handle for the purpose of working this part of the apparatus. Above one end of the washer are fixed two rollers, worked by the customary wheel and handle, which may be used either for wringing or for mangling the clothes, as may be desired. To operate the machine, the propeller is first put in position, and the washer is half-filled with hot water. The soiled portions having been soaped, the clothes are then placed in approximately equal quantities on each side of the propeller, and, by means of the long, projecting handle, the propeller is worked backwards and forwards for about three minutes. This action alternately drives the water through the clothes and sucks it back again, washing out the dirt in the process. The moving weight of water enables the propeller to work largely by its own momentum, and thus very little exertion is needed on the part of the operator. At the end of the three minutes the propeller may be lifted out, and the clothes wrung out by being passed through the rollers in the usual way. When the washing is completed, and at such intervals as may be necessary, the water is run off by means of a tap fixed near the bottom of the 'tub,' the propeller is packed away inside the washer, and a large, flat board is placed on the top, forming a convenient table when the rollers are subsequently being used for the purpose of mangling the clothes. This operation having been effected, the 'wringer' is easily lowered by means of a hinge to the end of the washer, which may then be used during the rest of the week as an ordinary table.

A NOVEL FORM OF KETTLE.

Many and varied are the appliances which have recently been placed on the market for the purpose of using artificial heat in the most economical way. One of the most recent of these is an ingenious form of kettle. Through the centre of it, from top to bottom, runs an aperture, so that when it is placed on a fire, a stove, or a gas-ring, the flames play not only on the bottom of the kettle, but also on the circumference of this inner aperture as well, thus causing the water to boil in less than the usual time. This, however, is by no means the most important advantage offered by this unique appliance. The handle of the kettle is hinged at the back, and is so constructed that it can be detached at the front, and turned right back at the hinge, allowing a frying-pan or a sauce-pan to be placed on top of the kettle. The contents of the pan are cooking while the kettle is being brought to the boil, thus enabling one source of heat to be used for two purposes at one and the same time. When so desired, a wire grid placed over the aperture instead of a cooking-utensil makes an excellent bread-toaster if the flame is turned down sufficiently, or flat-irons may be heated for the purpose of ironing the weekly wash. The kettle, which holds about two quarts, is made both in tin-plate and in copper, the latter material offering obvious advantages.

NEW HOME CINEMA FOR STANDARD FILMS.

The opportunity of seeing moving-pictures in the home has several advantages over going to a picture-palace, especially where children are concerned. One important point is that a careful selection of the films can be made and objectionable matter eliminated. For children's parties the home cinema is ideal, while the adults present are by no means uninterested. A very simple apparatus for household use has lately made its advent. The source of light is a half-watt lamp connected to any lamp-socket. Standard-size films can be used with this machine, and one of the spools is fitted with the necessary gear and a handle for rapid rewinding. The films are operated by merely turning a handle, not the slightest technical skill or knowledge on the part of the operator being necessary. A cover furnished with a handle for carrying purposes is provided, and the complete apparatus is mounted on a wood base, measuring twenty-one inches by thirteen inches, suitable for resting on a table.

A NEW HYDRAULIC CLUTCH.

No one contends that the friction-clutch as used on the ordinary car is entirely satisfactory; but hitherto no simple alternative has been available which could be firmly relied upon to give better results. Recently a new form of clutch has been invented and patented by Professor Hele-Shaw. This device is hydraulic in character, but dependent upon oil instead of water for its operation. The clutch in its simplest form consists of a cylindrical case which is attached to the flywheel of the motor. Inside this case, and set radially, are six cylinders, arranged in pairs opposite each other. The cylinders

are fitted with plungers, those opposite to each other being connected together, so that they move in unison. In the centre, between the cylinders, is a shaft to be driven, upon which are mounted two opposite eccentrics. These rotate inside six-sided bushes, by means of which the plungers are reciprocated. As the eccentrics are set opposite to each other, when one plunger of a pair is going into its cylinder, the other is coming out. Assuming that the spaces at the back of the plungers are in communication and full of oil, this oil would keep passing backwards and forwards from one cylinder to the other, as the plungers moved up and down. Now, suppose we fix a valve, which can be opened or closed at will, in the communication-passage between the cylinders. When the valve is closed, the oil will not be able to pass from one cylinder to the other; consequently the plungers cannot move. These, again, lock the eccentrics, which cannot rotate. Hence the casing carrying the cylinders is locked to the shaft carrying the eccentrics, and the clutch is engaged. Immediately the valves in the passages between the cylinders are opened, the plungers can reciprocate freely, and the clutch is free. The casing carrying the cylinders is fitted with a front cover, in which is a bearing for the driven shaft, and also a stuffing-box and a gland to prevent any escape of oil, as the casing is completely filled. Means are provided for making up any leakage past the plungers, so that the spaces at the outer ends of the cylinders are always completely filled with oil. Safety-valves are also provided which will open and release the pressure in the cylinders when it exceeds certain limits, and the clutch will slip. This is a most valuable feature for clutches used between electric-motors and oil-engines on the one hand, and the machines they have to drive on the other. Again, these clutches can be used as hydraulic brakes. In fact, if applied to winches driven by oil-engines, they are capable of serving the double purpose of safety-slipping-devices and brakes for lowering the loads. When machinery of a very heavy description, such as a railway-train, has to be started from rest, this clutch forms an ideal connection between an oil-engine and the driving-wheels, as the latter can be started up as gradually as may be desired. It will be noted that the clutches are self-oiling; hence the wear on them is negligible. Moreover, they can be operated from a distance by Bowden wires if desired, as, the valves being balanced, it takes a very small amount of force to operate them. Last, but not least, there is no limit to the power for which they can be designed and constructed.

AERIAL PHOTOGRAPHY AS AN AID IN LAND-SURVEYING.

After what was effected during the war in aerial photography, it is only natural that attempts should be made to apply this art to the making of surveys. Experiments in this direction were carried out in July 1919 by the United States Coast and Geodetic Survey, the area around Atlantic City, N.J., being selected for the purpose. Photographs were taken from both land and sea planes, and some from an airship. By means of negatives taken from a height of 7000 feet, with a lens of 10-inch focal length, a mosaic was constructed having a scale of about 1 to 8000. From the results of these experiments it is thought that the system has valuable possibilities, more especially for revising sections of the coast-line which have undergone changes owing to the action of the sea. Further experiments were carried out in March 1920 by the Army Air Service, when the coast-line of New Jersey, from Cape Maine to Seabright, was photographed in a single flight at a height of 10,000 feet. A lead weight attached to the lowest point of the camera, which was mounted in gimbals, kept the instrument in a vertical position. Although the coast-line photographed is 120 miles in length, the negatives were taken in less than two hours, while the development and printing occupied only two days. A total of 183 photographs was taken in all. The subsequent work of constructing the mosaic and reducing the scale of the chart for purposes of comparison was carried out in fifteen days by one man.

A NEW IRONING-MACHINE.

Although primarily intended for laundry use, an ironing-machine we have seen recently might well be installed in very large households where the washing is done at home. It consists of an ironing-board fixed at a convenient height, on which a very large gas-heated iron is caused to work backwards and forwards by mechanical power. The power is applied through an endless band, driven by an electric-motor or other motive-power, and placed at the back of the ironing-board. Naturally the upper half of the band travels in one direction, while the lower half moves in the other; and by an ingenious clutch, controlled by means of a single handle, the iron can be moved backwards and forwards, making long or short strokes as required, the motions closely resembling those of a small flat-iron worked by hand. No exertion is required on the part of the operator, all movements being brought about by the endless band in response to slight deflections of the controlling handle. All kinds of ironing-work can be performed by this machine with the same delicacy of touch as if the operations were being carried out with the help of a hand flat-iron.

QUICK DRYING FOR HOSIERY.

An invention making for greater efficiency in one department of laundry-work was to be seen at a recent laundry exhibition at Olympia. This consisted of what appeared to be a number of

aluminium dummy legs mounted in a row with the feet pointing upwards. These dummies, however, were not of the ordinary form, but were much wider and flatter, being in section shaped like a double-convex lens with comparatively sharp edges. Each leg is heated by steam, which traverses up one side and down the other. After being washed, the wet stockings are pulled over the legs, and are dried very quickly, while the sharp edges make creases in the correct position, so that the articles come off in a finished state, as they would be bought new in a shop. The system is particularly valuable for silk stockings, which are liable to tear when ironed. Dummy hands, made on similar principles, are also provided for gloves. The steam-pressure is only four pounds to the square inch, and is, therefore, perfectly safe. It is shown by experience that the rate of drying is greatly increased by this system as compared with the older methods of treatment.

A COMBINED RADIATOR AND COOKER.

A gas cooker sufficiently clean and ornamental in character to serve also as a radiator for use in a sitting-room is a distinctly serviceable piece of apparatus for the ordinary household. An appliance of this kind which we have recently examined is cubical in form, and measures about twelve inches each way. A gas-burner, in the shape of a pipe with numerous holes, passes through the heater from one side to the other. Outside at the end is the usual Bunsen jet, together with a spigot for connecting the burner with a gas-bracket by means of a flexible tube. The appliance, which is made of polished steel or aluminium, has a lid at the top, two deflecting-plates over the burner, and an oven with a door at one side under the burner. When the apparatus is used as a radiator, the lid at the top is slightly lifted, and the oven door is opened wide. The burner, when turned full on, consumes ten feet of gas an hour, and the appliance is said to be capable of warming up a room measuring twenty-four feet by sixteen feet in ten minutes. At the end of that time the necessary temperature will be maintained though the gas-tap is turned half-way off. When the apparatus is used for cooking a breakfast, the lid is opened wide, so that it is at right angles to its normal position, and the cooking-utensils are placed on a gridiron over the burner. The oven may be utilised for heating plates, for making toast, or for grilling or baking with radiant heat. The appliance may also be used for cooking other meals within the range of its capacity. For baking pastry or pies, the cooker is turned upside-down, and the deflectors are placed horizontally.

PARTS FOR CONSTRUCTING TOY MOTOR-CHASSIS.

Based on the principle of the time-honoured box of bricks, with which our forefathers amused themselves by building various structures, sets of parts are now sold that can be combined into all kinds of mechanical appliances. Among the recent additions to commodities of this class is a box containing all the parts necessary for building a motor-chassis. These include every essential detail to give the appearance of the real thing, except, of course, that the bonnet contains no engine under it. The wheels have rubber tires, and a spare one is carried in the usual position. There is also a steering-wheel, which actually steers by moving the front-wheels, together with a radiator, mud-guards, running-boards, and other components, making up a total of a hundred and forty-eight separate parts. A boy has to exercise considerable ingenuity in forming the complete car from this set by help of the instructions, while a further exercise of his powers is entailed in the construction of various kinds of body. These can be made up from the general sets sold by the makers, or constructed with a penknife from thin wood or stout cardboard. There has also recently been brought out by the makers of these parts a small electric-motor, with clockwork gearing, which is so designed that it can be attached to the various mechanical models that can be made up. A special feature of it is a reversing-switch, whereby the mechanism can be caused to rotate in either direction. Unlike other similar motors, it requires a very small amount of current to drive it. An accumulator is sold for use with the motor, but it can also be run by means of a Leclanché cell, or even of a dry battery.

NEW HIGH-LIFTING-POWER AEROPLANE-WING.

Not long ago reference was made in this column to the new Handley-Page aeroplane-wing, which has a lifting-power from 33⅓ to 100 per cent. greater than the ordinary type of wing. Another important advantage is that aeroplanes fitted with these wings can land and 'take off' at much slower speeds than machines having ordinary wings, with the results that greater safety is assured for those on board, and shorter landing-grounds may be employed without increasing the risk. Really the wing is of the Venetian-blind type, made up of tubular laths, of which the outsides are of a thin, curved, pear section, the leading edge being thick, while the trailing edge is thinned down and curves round the upper side of the next lath, leaving an air-passage between the two. Even with only one lath and air-passage at the leading edge an increase of about 55 per cent. in lifting-power is effected. A machine with wings of this type was tried at Cricklewood against a similar aeroplane with ordinary wings. The former climbed more quickly and at a steeper angle, and was also able to alight at a much lower speed. It is scarcely necessary to emphasise the immense advance in aeronautics brought about by this wing, which

should enable great reductions to be made in passenger fares and goods rates.

DARNING BY MEANS OF A SEWING-MACHINE.

One of the most irksome duties the housewife is called upon to perform is the darning of stockings, socks, and other garments, and she will welcome any appliance which expedites this tedious task. A device whereby darning can be performed by means of an ordinary sewing-machine in a tithe of the time needed to carry out the operation by hand was shown at a recent exhibition. This consists of a light metal ring, over which the material is stretched, being tightly held in position by a wire spring. The presser foot is removed from the sewing-machine to allow the ring to pass, and a small spiral wire device is slipped over the needle for the purpose of guiding the thread. A combination of thread and wool is used for darning by this method, and this gives a better wearing surface than a darn made with wool only. The thread is used in the needle, and the wool in the shuttle. Once the preparations are made, the darn is 'criss-crossed' in the ordinary way by the machine, the time taken being a matter of seconds for small holes. Small rings are supplied for socks and stockings, and larger ones for other garments, table-cloths, &c. For darning linen, thread, of course, is used in the shuttle instead of wool. Last, but not least in these days of high prices, the complete outfit is sold at a very reasonable figure.

A CURE FOR STEAMED SPECTACLES.

In damp weather the dimming of glass by moisture is a frequent source of annoyance alike to those who have to wear eyeglasses or spectacles in the street, and to photographers and others who use instruments in which glass lenses form an essential feature. A substance has been invented recently which entirely overcomes this trouble. Glass rubbed over with it does not show a trace of steam when breathed upon—a more severe test than any to which such appliances are subjected in ordinary use. The substance is guaranteed not to scratch the surface, while, if anything, it enhances the clearness of the glass to which it is applied. It is invaluable for preventing the steaming of wind-screens, show-cases, and other glazed surfaces which are liable to this drawback.

A NEW SOURCE OF ALCOHOL.

Much attention has been given of late years to the question of manufacturing within the Empire alcohol for use as motor-spirit. In a recent number of the *Bulletin of the Imperial Institute* the possibility was discussed of utilising for this purpose the mowra-flowers of India. These flowers possess thick, juicy petals, rich in sugar. They are used by the natives as a foodstuff, but more especially for the preparation by fermentation of an alcoholic liquor called 'daru' or 'mohwa' spirit. A single tree will yield from two to three hundred pounds weight of flowers in a year. The tree also produces a valuable oil-seed, which is exported to Europe in fairly large quantities. During the war the flowers were used in India for the production of acetone, the yield being said to be ten times as great as that obtained by distilling wood, which is the usual source of this substance. The demand for acetone in India in peace-times, however, is not great, and large quantities of the flowers would be available for the manufacture of alcohol, and would appear to be an exceptionally cheap source of this commodity, as the yield is high compared with that from potatoes and other materials commonly used, about ninety gallons of 95 per cent. alcohol being obtainable from one ton of dried flowers. It has been estimated that in the Hyderabad State alone there are already sufficient mowra-trees for the production of seven hundred thousand gallons of proof spirit per annum, in addition to that necessary for local requirements. It is suggested that the most profitable way of utilising the flowers would probably be as a source of mixed motor-spirit akin to 'Natalite,' a form of motor-spirit extracted from sugar-cane which war conditions brought forth in South Africa, and which is now in extensive use in that part of the world. There seems to be no reason why a spirit distilled from mowra-flowers should not be as useful in India as 'Natalite' has become in South Africa. That motor-spirit can be produced on a manufacturing scale in India from mowra-flowers has already been demonstrated, and it is stated that running trials in which it was used as a fuel have proved satisfactory.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

ANSWER TO 'REVERIE.'*

LITTLE winds sighing
Drowsy birds wake;
Night's shadows dying
O'er slumbering lake.

Glory of sun-rays
Hill crests adorn;
Chorus of birds' praise,
And, lo! it is morn.

M. C. MITCHELL.

SEVENTH SERIES

THE FLINT DEATH.

By Lewis Spence.

PART I.

I.

BRIERLY STRETTON and I were sitting on the lawn at Thorndean one evening in late September, discussing the intensive examination of ripple-flaking, when that which killed him came humming out of the twilight. He leapt from the basket-chair in which he had been lounging, and caught frantically at a cluster of feathers quivering at his throat. Almost before I could rise to help him he had fallen back into his seat, the last sobs of life upon his lips.

Bending over him in the half-light, I saw at once that his hurt was mortal. His eyes, hard in life, were now like gray stones, his strangled breathing a thing I still try to forget. On the left side of the neck the quills of an arrow bristled, a thread of scarlet slowly creeping among the gray feathers. The panic aroused by the sight of a mortal wound seized me, and I ran towards the house, shouting distractedly for the help I knew would be unavailing. Some one came running towards me, answering my call reassuringly. It was Relf, the butler.

'Sir Brierly has been shot,' I gasped. 'He is dying. Get the car out at once, and bring the doctor back with you. Quick, man; quick!'

He stood for a moment in scared indecision, then turned and ran in the direction of the stables. The white apron of a maid fluttered at the hall door. I hailed her.

'Sir Brierly has been shot,' I called. 'Telephone at once to the village for the police.'

She disappeared with a little cry. I ran back to where Stretton lay. I searched for signs of life, but was unrewarded. I suppose I am as resourceful as most men, but never have I felt so utterly at a loss. Had my friend been stricken down by a bullet, I should probably have extemporised some kind of a bandage. But to essay the withdrawal of an arrow seemed unthinkable. I had read somewhere that instant death invariably followed the removal of the shaft, and the garbled warning of an old ballad came to my mind in dominating and unhappy doggerel. I stood groaning in an agony of utter helplessness, and made useless efforts to stanch the blood with my handkerchief. The barb! In a fascination of inquisitive dread I raised the dead man's head. The shaft had passed sheer through between gorge and backbone, so that the shining point jutted cruelly beneath the right ear. Then I saw that it was of flint, chipped and polished into deadly keenness by the slow and painful craftsmanship of a primeval age—that very age to unriddle the dark story of which had been the consuming passion of Brierly Stretton's life.

In that black ten minutes I did not realise how weirdly singular it was that the man who was perhaps the chief living interpreter of the ancient past should die by the very kind of weapon with which he was so familiar. Then a sudden vivid brain-picture of the primitive archer who might once have fashioned and loosed such a bolt made me gaze with apprehension into the thick mass of evening shadows which were rapidly gathering beyond the semi-circle of trees at the lawn's margin. But no living movement stirred their obscurity, only the shifting muster and darkling play of late autumn afternoon, revealing the facile attraction of leafy places for the night.

A sudden impulse of vengeance urged me towards the wall of tree-trunks, but I had scarcely taken a first impetuous stride when I heard a woman's voice calling my name in miserable fear. Turning, I saw Bianca Stretton running across the lawn, a muslin wrap thrown over her evening-dress and streaming behind her in shadowy, unreal folds. With outstretched arms I placed myself in her way.

'Go back at once,' I implored. 'I will come to you as soon as I can. You must not'——

'He is dead.' The words were uttered in certainty rather than question.

'He is dead,' I confessed wretchedly. 'He was struck down at my side as we talked.'

'Randal,' she said harshly, 'I must know more. I am ready to hear—anything.'

She dropped the gauzy veiling which she had crushed into ragged wisps, and grasped my wrists. I had thought her a fragile woman, fragile in her body and her affections. After all, she must have cared.

'Better that you should not ask now,' I

 [All Rights Reserved.]

pleaded, but the anguish of her eyes was not to be borne. 'If you must know,' I faltered, 'an arrow came out of the wood yonder—an arrow with a flint head.'

For a moment she stood rigid; then she whispered something that I could not catch, shuddered, and slipped to the grass.

II.

I carried her into the house. In the dark hall the servants herded together. Two of them took Bianca to her room. A babel of questions pursued me, but I waved them aside. Then the car plunged up to the door, and a little man in a bowler hat and spectacles ran briskly up the steps.

'Dr Bolton,' he said in sharp introduction. 'Sir Brierly has met with a serious accident, I understand. Where is he?'

I caught him by the arm, and we hurried across the lawn.

'Sir Brierly is lying where he fell when he was struck down,' I explained, 'in that chair over yonder. I am afraid that he is quite dead. Nothing could be done that seemed of any avail.'

He bent over the body, and immediately sprang upright. 'What's this?' he said sternly. 'An arrow? How shocking! How did it happen?'

I told him what I knew, and saw doubt in his eyes.

'You are Mr Randal Mercer,' he said. 'I have seen you in the village with Sir Brierly.'

'You are sure that life is extinct?' I asked.

'Quite,' he replied gruffly. 'We must leave the body where it is until the police come. It's scarcely credible that he was killed with a primitive thing like this;' and he touched the arrow. 'It must have been fired with great force and at very short range to have done such execution.'

'Flint can be made as keen, if not as tough, as Sheffield steel,' I remonstrated.

'You surely don't believe a weapon like that capable of such penetrative power?' he snarled.

'I saw it strike him,' I protested.

'Then did you see who fired it?'

'No, I did not,' I said sharply, nettled at his tone.

'Here are the police,' he growled. 'After all, it's a matter for them.'

An inspector and a constable alighted from their bicycles and approached us. They plied me with questions. I told them all I knew in a few words.

'You see the kind of thing that killed Sir Brierly, inspector,' rapped out the doctor. 'Mr Mercer here is an antiquary. Perhaps he can throw some light upon its character.'

I kept my temper, although it was not easy. The man was a suspicious ass, I told myself, unworthy of my anger. The inspector turned to me anxiously.

'Unless I'm greatly mistaken,' I said, 'the arrow-head is not a genuine antique, but a modern imitation of the real thing—a forgery of a Neolithic weapon.'

'Then,' said the doctor, 'you think that it was made by some one who—by an antiquary, perhaps?'

'I'm scarcely prepared to say,' I replied. 'Few of the archæologists I know could turn out so skilful a piece of work. There is still a handful of flint-knappers throughout the country who make such pieces to sell to credulous collectors. Naturally, my examination of the weapon has been of the most casual description, but unless I am quite wrong, it was made by some one who had knowledge of the art at first-hand. It is a masterly piece of workmanship, such as would deceive most experts.'

'Umph!' said Dr Bolton. 'Would it deceive you, Mr Mercer?

'I will answer that question at the proper time,' I replied quietly. 'I think that you should see Lady Stretton, who is quite overcome.'

He turned away and walked towards the house. Then we raised poor Stretton's body and carried it to his bedroom.

It was easy to see that Inspector Greave was overwhelmed by his responsibilities, but I found him helpful and sympathetic. At once, and by common consent, we resolved upon a systematic search of the grounds and the neighbouring country. The inspector despatched his man to assemble the gamekeepers and the gardeners on the estate, and while this was being done telephoned to the police in the surrounding districts. Then we entered the little wood and commenced our search.

It was plain that the inspector had undertaken this examination of the policies in deference to custom. More than once I pointed out to him that in the circumstances, and under such conditions, it was hopeless to expect other than negative results. But he respectfully insisted on carrying out his programme, and after an exploration lasting nearly four hours, in which we covered a very considerable area, we returned to the house exhausted, and with nothing to show for our labours but scratched hands and damaged clothes.

The inspector announced his intention of remaining at Thorndean House for the night, and after I had made the necessary arrangements with Relf, he accompanied me to the smoking-room at my request. For some time we sat reviewing the scanty evidence at our command, until at last we resolved that the inspector and his men should resume the search on the following morning, and went upstairs to bed.

III.

Catastrophe often acts as a drug to those who have been brought within its compass, but impress myself as I might with the difficulties and responsibilities of the morrow, I could not sleep, but lay pondering on the incredible thing which

had happened. One fantastic theory after another knocked at the door of reason. With an effort I rid my mind of such distractions, and lay feverishly reviewing the details of my long association with Stretton. Closely as we had been connected in our work, I now realised that we had never been drawn into the bonds of actual friendship. Our almost perfect agreement in most things connected with the study to which we had devoted ourselves had proved insufficient to arouse, in me at least, the personal attraction which makes for regard, or to break down the barriers of Stretton's natural reserve. He was, of all men I had known, the most aloof and academically supercilious. I was well aware that he had made for himself a host of enemies by the unsparing exercise of his cool and superior cynicism. I was, indeed, one of the few friends he had tolerated. The man had been a mere intellect, dominating, incisive, brilliantly equipped, if you like, but lacking in the common touch by which genius finds its way to universal understanding. Companionship, I now realised, had not been among his necessities. He had even selected his beautiful wife in the spirit of a connoisseur. She had been his secretary at the museum, and had been placed in his house merely as an example of her husband's good taste.

Before we had set out upon our search, I had requested Dr Bolton to telegraph from Thorndean village to Stephen Barrasford, Sir Brierly's nephew, whom I believed to be his only living relative, and when I came downstairs on the following morning I found a wire from Barrasford, informing me that he would arrive at Thorndean Junction by the 2.15 train. I inquired for Lady Stretton, and was told that, although she was as well as could be expected in the circumstances, she was still confined to her room. I had a long conversation with Inspector Greave, who had been afoot at an early hour. He was more puzzled than ever by the total absence of the kind of clue to which he was accustomed, and as I sat at breakfast I saw him mount his bicycle and pedal dejectedly down the avenue.

The writing of a number of necessary letters occupied me during the morning, and after lunch, feeling that physical exercise was essential in my present condition, I resolved to walk to Thorndean Junction to meet Barrasford. My way led through the plantation which skirted the lawn, as by crossing it I cut off the length of the winding avenue. The well-trodden path through the little wood merged into a narrow walk which led to a side-door giving directly on to the moorland highway which would take me to the village. The rugged, solitary part of the country in which Thorndean was situated had become endeared to Stretton as the neighbourhood of his most striking archæological discoveries, for among its cliffs, honeycombed with caves, once the abode of Neolithic hunters, he had been enabled to collect the evidence which illustrated his theories of prehistoric life, and I had not been surprised when he had purchased this small estate, situated amidst surroundings which had become so closely identified with his work. I was a little astonished, however, that his young wife was so easily reconciled to life in a district from which all social pleasures were so far removed. But on coming to pay a short visit to the Strettons, I noticed that she seemed so listless, so thoroughly absent and out of touch with everything, as to be careless of her surroundings.

I had remarked to Stretton that his wife seemed *distraite* and dispirited, but he had answered me brusquely, and I had naturally refrained from further comment upon the very marked change in her health and appearance. She and I had struck up a not very garrulous acquaintance, and more than once I had reason to think that she was anxious to cross the line which divides things personal from commonplaces and give me her confidence. At least, I had upon occasion observed her regarding me in that appraising manner which with some people is prefatory to reliance. But she remained silent, and I concluded that her listless condition was due to a lack of vitality; indeed, I think I put it down to anæmia.

IV.

I reached the small side-door in the retaining wall, but on attempting to open it found that it was jammed by something which had caught between the edge of the door and the door-post. By dint of a violent pull I succeeded in wrenching it open. As I did so something furry and red-brown in colour fell at my feet. I turned it over with my stick, then in an access of idle interest stooped and picked it up. It was a fragment of fox's skin, perhaps five inches by four. At first I thought that one of the keepers had made a temporary wedge of it for the purpose of closing the door, but the fact that the entrance was provided with an ordinary latch, and was so constantly in use as hardly ever to be locked, disposed at once of such an idea. I noticed, too, that the door was one of those which could be opened from the inside only, and that if the end of a fox-skin muff or necklet were caught in it, its owner would be forced to leave that part of the garment behind. The under side of the skin, I saw, had been roughly tanned, but small portions of integument were still adhering to it. On the impulse of the moment, and for what reason I could not have explained, I placed the fragment in my pocket and passed on my way.

I walked rapidly, and gradually felt the gloom which had pressed upon me so heavily lift and disappear. The country through which I passed was perhaps the wildest in the north of England. To the east soared dark cliffs fringed by sombre

fir-woods. In those heights Stretton and I had often wandered, when, with the condescension of the official archæologist towards the mere amateur, he had acted as my guide to the caves in which he had made his discoveries, and had explained the processes of reasoning on which his striking theories of Neolithic life depended.

This rugged country-side, indeed, appealed to me as a fitting environment for a primitive people. The lofty cliffs, riddled with caverns, must plainly at one time have afforded refuge to a swarming community, who in the neighbouring woods would find abundance of game, and in the sparkling becks and brawling linns provender of trout and an unfailing supply of water. So powerfully was I impressed with my surroundings as the haunt of pristine life that the gray heights seemed the ambush of hostility, and the thin breeze in the moorland undergrowth the rustle made by stalking hunters. Then recollection completed what fancy had begun. The arrow! Did such a shaft await me upon this silent moor? In a quiver of cowardice I cursed myself for walking when I might have driven, for I felt with pitiless intuition that within the sombre shelter of these threatening cliffs or secret woods had been fashioned the thing which had taken Stretton's life. With an oath I shook myself and hurried on, stumbling along with anxious looks and crouching shoulders, like a frightened boor upon a darkling road. Then I broke into a shambling run, which only slowed into a walk when I topped a rise, and was comforted by the red roofs of Thorndean a mile away.

(*Continued on page 170.*)

THE NEW BALTIC STATES.

I.—ESTHONIA.

By Robert Machray.

I.

AMONG the new national flags, and in some respects as notable as any of them, is the blue, black, and white flag of the Republic of Esthonia, or Eesti Vabariik, as it is called in Esthonian. It is a flag that is certain to be seen flying more and more frequently on the seas, and particularly in such British ports as Aberdeen, Dundee, Leith, and Newcastle, with which the Esthonians already have a large and constantly increasing trade. With their relatively considerable coast-line on the mainland, and with the adjacent islands in Moon Sound which are peopled by them, they have long been, naturally enough, a seafaring folk, and in the dark days when Europe was in the making even more than it is to-day, they were sea-rovers and land-raiders, just as many of our own ancestors were.

After various political changes Esthonia passed to Russia, of which it formed an insignificant portion territorially. Yet it was of great importance commercially because of its harbours, open, with the occasional assistance of ice-breakers, all the year round. To say nothing of the exportable products of the country, there poured into Reval and its other ports vast quantities of valuable cargo from north and north-central Russia and from Siberia for shipment abroad. With their kinsmen the Finns and their neighbours the Letts, the Esthonians to a large extent supplied the personnel of the Russian navy and mercantile marine. Besides, these harbours of theirs were of the highest importance to Russia strategically—to that Russia which has vanished. Reval was a Russian base—it is so no more. But the transit trade remains; it fell off, and for a time ceased altogether, during the Great War and what immediately followed, but it is growing and swelling again.

Known till very recently only as one of the Baltic provinces of Russia, little Esthonia was practically swallowed up in the immensity of the Russian Empire, and its people were almost universally regarded by the outside world as Russians, though they themselves had steadily refused, in spite of persecutions of all sorts, to be Russified, and had fought and struggled hard to retain their nationality. It was not, however, till after the beginning of the Revolution of 1917 that Esthonia, emerging from that cataclysm, asserted itself as a distinct political entity, with a destiny of its own quite apart from that of Russia. The early history of the Baltic lands is obscure, but Esthonian writers maintain that up to seven hundred years ago their land was free and self-governing, its tribes being united in a loosely organised commonwealth, and, further, that after it was deprived of its independence by invaders who were too strong to be defeated and rolled back, it yet, through all these centuries, never lost its national self-consciousness, but clung to the hope of being free again, and did what it could to regain that freedom.

Nationality does persist sometimes in this marvellous way in spite of everything, but it was not till two or three years ago that the world at large became aware of the claim of the Esthonians to nationhood. That claim they have made good, but only through great tribulation. It is one of the finest and most heroic stories of our time. It is not a story that is well known. It is safe to say that in Great

Britain, as in most countries, the general public had only the vaguest notions as to what was covered by the terms Esthonia and Esthonians, and that they are still very imperfectly acquainted with their meaning. Before attempting to tell the story of Esthonia's fight for freedom, it will be well, therefore, to give some account of the country and its inhabitants.

II.

In the dim past a wave or waves of Asiatic migration carried various Finnish tribes to the shores of the Baltic. Some of them settled in the north, in what came to be known as Finland; while others made their homes in the south, in the territory lying between the Gulfs of Finland and Riga on the west and Lakes Peipus and Pskov on the east. This territory afterwards was called Esthland or Estland, because the Finns who peopled it were designated Esths or Ests, and hence arose the terms Esthonia and Esthonians. It was the Germans who originated these names. Early in the thirteenth century the Germans, in the shape of the Order of the Teutonic Knights, pushed up from Livland or Livonia, the modern Lettland or Latvia, and conquered the southern half of Esthonia. About the same time the Danes founded Reval, and occupied the northern part of the country; but rather more than a hundred years later they sold their share to the Germans, who united Esthonia with Livonia. The 'Baltic Barons,' who figure so prominently in the story of the Baltic lands up to the present day, are the descendants of the Teutonic Knights. After the Order was dissolved in 1560, Northern Esthonia passed to Sweden, Southern Esthonia to Poland. In 1629, however, all Esthonia—practically Esthonia as it is now constituted—became a province of Sweden, and it remained under Sweden till 1721, when it was ceded to Russia, who kept it till the Revolution, but not as one administrative area, the southern part being separated from the northern and joined on to Livonia. The Republic of Esthonia includes that southern part, which formerly was often called Northern Livonia.

After undergoing these vicissitudes of political fortune Esthonia has recovered its old-time ethnic frontiers, which are: on the north the Gulf of Finland, on the east the Russian 'governments' of Petrograd and Pskov, on the south Latvia and the Gulf of Riga, and on the west the Baltic. The territory of the Republic also includes the islands of Dagoe and Oesel, and a number of smaller islands, all lying a short distance from the mainland. The total area of Esthonia is nearly 22,000 square miles. The islands and the mainland for the most part lie low, the rise of the latter from the coast never being much above three hundred feet. Geographers employ the expression 'Baltic Heights,' but these heights, which extend through East Prussia into Esthonia, are really far from being high, their elevation rarely exceeding a thousand feet. The Baltic States form, in fact, a gently upward-sloping tableland, which continues into Russia like a colossal gangway. The point of view of these states is that central Russia and Siberia are their natural hinterland; on the other side, it must be remarked, there are still many Russians who hold that the Baltic lands are the natural approaches of Russia to the sea, and therefore should remain in Russian hands. And herein lies the great risk to these states in the future, when presumably there will be a strong, united Russia again. Esthonians are well aware of this danger, but passionately assert their right as a people to self-determination, and draw attention to the fact that their country, though small, is larger than Switzerland, Belgium, or Denmark. Consistently with their own independence, they are willing to do all they can for Russia, as they have already shown by the treaty they have made with the Soviets.

III.

Apart from the shipping industry which is the consequence of its position on the Baltic, agriculture and forestry are the main occupations of Esthonia. The terrain is intersected by numerous rivers and streams, and much of it is swampy; there are many lakes, and about one-half of Lake Peipus is Esthonian. The forests are valuable and extensive, three-tenths of the whole country being covered with woods, mostly of pine and fir. The soil is by no means rich, but it is cultivated scientifically, and produces good crops, particularly of flax. Little or no wheat is grown, but other grains do fairly well. There is a flourishing live-stock industry. Going from Esthonia into Russia, the traveller is struck by the different aspect of the agricultural districts; in the former the trim and tidy farms are grouped about the farm-houses and steadings as in England and Scotland, while in the latter the farm-houses are lumped together in higgledy-piggledy villages, with the badly-cared-for fields lying all around them. This indicates a difference not only with respect to the agriculture, but also with regard to the general culture of the two peoples.

The standard of popular education in Esthonia is very high, there being few illiterates. Before the Great War about 80 per cent. of the population could read and write, whereas in Russia only about 20 per cent. could do so. Secondary education is provided by numerous grammar-schools and lyceums, a very large number of the pupils being the sons of farmers; every farmer considers that he is bound in honour to give at least one of his sons a secondary and, if possible, a university education. The University of Esthonia is situated at Dorpat; it was founded by Gustavus Adolphus in 1632, and was reopened in

1919, after the German occupation of the country had come to an end. There is a polytechnic school at Reval, and technical education is being developed in many engineering, naval, and commercial academies. As yet Esthonia is not a great manufacturing state, but it has iron, steel, machinery, wood-pulp, paper-making, cotton, and spirits industries, some of which, such as wood-pulp and paper-making, are of growing importance. The manufacture of spirits is on the increase, and it is said that these spirits appear in other countries, but not as the product of Esthonia!

For 1920 the population of Esthonia was estimated by the authorities at 1,800,000, 95 per cent. being pure Esthonian, and the rest German, Russian, Swedish, and Jewish. The pure Esthonians, of the old Finnish stock, have a language of their own, but it closely resembles that of Finland. Before the Great War these Esthonians were farmers, small *bourgeoisie* of the towns, intellectuals, and sailors and fisher-folk. The Russians, mostly officials and their families, and the Germans, whether Baltic Barons or big merchants, formed the upper class. For many a long year the pure Esthonians were serfs or little better, and education was compulsory in Russian and German—it is only since the establishment of the Republic that all education has been conducted in Esthonian. Yet Esthonian books appeared as far back as the seventeenth century, and the country is immensely rich in songs, tales, and folklore generally, often of a somewhat melancholy type, as might be expected in the circumstances, for the seven centuries of servitude left their mark. The people themselves are quiet, sober, and industrious. Their climate is one that calls for effort on their part; the summers are rather short and usually cool; their winters are rather long and cold, with about two feet of snow lying on the ground during most of the season. It may be recalled that the almost tideless Baltic is much colder in winter than the North Sea.

IV.

Esthonia is the kind of country that breeds a hardy and vigorous people. They showed their quality in their fight for freedom. That struggle may be said to have begun in 1917, though there were not wanting indications before of the growing strength of the national movement. Soon after the outbreak of the Russian Revolution the Esthonian leaders asked the Russian Provisional Government, then headed by Prince Lvoff, to grant autonomy to Esthonia, their idea then being that their land should remain part of Russia, but self-governing, and to this the Provisional Government agreed, a decree to that effect being issued on 12th April 1917. A remarkable thing about this decree was that it gave North Livonia to Esthonia, which thereby regained its old frontier on the south. The Esthonians promptly proceeded to elect, by universal suffrage, a National Council or Diet, and this council met at Reval in the following July, when a National Government was set up, first with Dr J. Ramon, and afterwards with Constantin Paets, as its head. This Government was Esthonian, not Russian or German, and the Baltic Barons, who, because of their owning about two-thirds of the land, had been the real governing class for centuries, no matter to what overlord country Esthonia had belonged, were left out in the cold—a thing which filled them with the deepest resentment. The next development came after the seizure of the supreme power in Russia by Lenin and the Bolsheviks. Late in November of the same year Esthonia, like Finland, decided to become entirely independent, and was about to hold a Constituent Assembly for the settlement of the government of the country, when the Bolsheviks intervened, and summarily dissolved the National Council. Notwithstanding this, the Paets Government still continued in being, and on 24th February 1918 proclaimed Esthonia an independent republic.

Meanwhile negotiations had been going on at Brest Litovsk between the Germans and the Bolsheviks for peace; and when these broke down, the Germans, to compel Lenin to come to terms, took Reval, and marching through Esthonia and Livonia, captured Dvinsk and Pskov, thus threatening Petrograd, whereupon the Bolsheviks, who said the 'German knee was on their chest,' threw up the sponge. The Germans, to the unconcealed joy of the Baltic Barons, occupied both Esthonia and Livonia, and the Paets Government was in evil case. Under the Brest Litovsk treaty the Bolsheviks agreed to evacuate these two provinces, which, it was stipulated, were to be policed by the Germans —that is, occupied until the state organisation of Esthonia and Livonia was restored. This meant the re-establishment of the local *Landtags*, or Provincial Councils, which had existed before the Revolution, and which had been staffed and manned almost exclusively by the Baltic Barons and their friends, who took good care of their own interests. Had the treaty not been cancelled by the defeat of Germany in the Great War, one of its results would in practice have been the complete Germanisation of Esthonia.

With all their strength the Esthonians protested against the German occupation, but as they had not been able to form a national army in any considerable force, their protests passed unheeded by the Germans, who, of course, had the support of the Baltic Barons. Yet somehow the Paets Government contrived to survive, and it appealed to the Allies for help, one sign of which was accorded when, on 3rd May 1918, the British Government recognised it, or, rather, the

National Council which it represented, as a *de facto* independent Government, and received Mr Anton Piip, a distinguished professor of Dorpat University, as its diplomatic agent in London. France and Italy later recognised the National Council as the *de facto* Government of Esthonia. But it was not till the power of Germany was finally broken on the battlefields of the West that the Esthonians got rid of the German soldiers. On 19th November 1918 Esthonia concluded an agreement with Germany for the immediate evacuation of the latter's troops. Germany did evacuate the country, but in such a manner as to give ample opportunity for its invasion by the Bolsheviks, to whom the German commanders actually supplied arms and ammunition. Here again was seen the influence of the Baltic Barons; indeed, they made no secret of the fact that, if Esthonia was not to be German, they preferred it to be in the hands of the Bolsheviks rather than in those of the Esthonians.

But the Esthonians were firmly determined that their country should not become Bolshevist, and they organised an army against the invaders. The Bolsheviks had never been popular in Esthonia, and Bolshevism had few adherents among the people; nor could its horrible manifestations in Esthonia have any effect other than to cause the utmost detestation and hatred of it. Supported by the Bolshevik fleet in the Baltic, the Bolsheviks advanced into the country, pillaging, torturing, and murdering, till within twenty miles of Reval, where they were held up at last by the Esthonian forces, mostly untrained and poorly armed. The position of Esthonia had seemed hopeless, but there was a magnificent rally round the flag. Finland sent men, thousands of rifles, some guns, and ten million Finnish marks to assist the kindred nation. In December a British fleet, under Admiral Sinclair, entered Reval, bringing arms and munitions, and afterwards captured two Bolshevik destroyers, which were handed over to the Esthonians, who thus were enabled to land troops in rear of the enemy. This was the turning-point in the struggle, and the Bolsheviks retreated in a panic, killing their own commissars as they fled, and abandoning their guns and equipment. In their turn the Esthonians advanced, and fighting splendidly against superior forces, drove the Bolsheviks beyond the frontier by 24th February 1919. After a pause for the reconstruction of their army, the Bolsheviks again attacked Esthonia. The Esthonians were one to five Bolsheviks, and the fighting was bitter and sanguinary; but by the middle of May the invaders were beaten back, and then, again taken in the rear, fled panic-stricken as on the former occasion.

v.

While carrying on this war of life and death with Bolshevik Russia the Esthonians resumed their building up of the Republic. A General Election was held early in April. Later in the same month the Constituent Assembly was summoned, and a democratic Government was formed, with Mr O. Strandmann, who had been Minister of Agriculture under Paets, as Prime Minister; and this Government remained in power until a new Coalition Government, with Mr J. Toenisson as Prime Minister, was formed in November 1919. The work of the Assembly lay chiefly in the direction of agrarian reform—the nationalisation of the estates of the Baltic Barons and the division of the land among the people. But the fighting against the Bolsheviks was not at an end, and the German *Landwehr*, with the Baltic Barons in the background, now took a hand in it against the Esthonians, who, however, helped to organise, by means of active defence, the Russian and Lettish anti-Bolshevik troops, with the immediate result that the Bolsheviks were driven back to Gatchina, near Petrograd, and thrown out of all Latvia. The latter operation properly belongs to the article on Latvia, and need only be noted here as part of the great struggle made by the Esthonians in 1919. Something must be said about the action of the Russian anti-Bolsheviks. Two drives from Esthonia were made by them at Petrograd, and the Esthonians supported both. Both failed ultimately. The first was attempted by the Russian Northern Volunteer Corps, the second by much larger Russian forces under Judenitch, who was saved in the upshot by the Esthonians. Neither of these offensives brought Esthonia any profit—indeed, much the reverse. On the other hand, it became perfectly clear that it was impossible for the Germans to effect a union with the anti-Bolshevik Russians with the object of overthrowing the Esthonian Government.

For a whole year Esthonia successfully resisted all the violent assaults of the Bolsheviks—a record of which its people may well be proud. The last heavy attacks were made on Narva in November–December 1919, and these were repulsed. In the previous August there had been some negotiations with a view to peace, but they proved abortive. As the year closed negotiations were resumed, an armistice was signed on 31st December, and peace was concluded on 2nd February 1920. Under the peace-treaty the full independence of Esthonia was recognised by the Bolshevik or Soviet Government. Esthonia was promised fifteen million gold roubles by the Bolsheviks—and this promise was kept; it was granted preferential rights for building a railway from Reval to Moscow, and on its part it undertook to give Russia free economic access to the sea, without any import or transit duty, and the use of its railways, with the same tariffs and dues as were paid by its own citizens. Subsequently the frontiers of the new state were defined by common consent. And thus at last Esthonia, not a few of whose people had been fighting

since 1914, was at peace, and in a position to go on with reconstruction and economic development. In June 1920 the Constituent Assembly passed a permanent constitutional or organic law for the Republic, providing that the Constituent Assembly should be succeeded by a Parliament known as the State Assembly. Each State Assembly must be elected by universal, equal, direct, secret, and proportional voting, and will normally remain in office for a period of three years. The Constitution was to come into force after the summoning of the first of these Assemblies, the elections for which were held late in November last.

THE MOUNTAINOUS MR NEUBURG.

By W. DOUGLAS NEWTON, Author of *War, The North Afire, The Undying Story, Phillip in Particular, The War Cache, Green Ladies, Westward with the Prince of Wales*, &c.

CHAPTER III.

I.

CLEMENT Seadon went to his room with a certain geniality in his heart.

When making his reservation at the reception-counter he had carefully studied the room-bookings before his name. The clerk had said to him, 'I'll give you a nice room on the fifth floor, Mr Seadon. A good room. Overlooks Dufferin Terrace and the river. One of the best rooms we've got.'

'I know it,' said Clement pleasantly. 'Ripping view. Have you anything on the same gallery as 359? I don't mind if there isn't a view.'

'Why, yes,' said the clerk; 'I can give you 362. It's round the corner, but it's on the same floor and only three doors away. Same view, too. It has an intercommunicating bathroom, but locked on your side, of course. You'll like that room.'

Clement Seadon hastily scanned the names above his. Who had room 361, on the other side of his intercommunicating bathroom? He looked. His heart beat. He said, 'Oh, but you're wrong. I fancy I shall more than like room 362.'

The name against room 361 was 'Adolf Neuburg.'

The 'Frontenac' has two lifts. As Clement knew this brilliant hotel quite well, he could choose his lift with cunning. By going to the one that wasn't in the public hall, he could not only get up to his room with discretion, but could approach it in such a way as not to turn the corner of the passage. Thus he could get into it without being seen on the gallery in which Mr Neuburg had his door.

There was a matter for further satisfaction—and also, it must be said, for a certain anxiety—in this business of rooms. He had had luck in getting a room next Mr Neuburg's. His choice of the gallery itself had been deliberate. Heloise Reys had her room on that gallery.

He had looked for her name at once, before he had sought out the name attached to room 361 and found it to be Adolf Neuburg. He had seen that the room booked to Heloise Reys was 359. The room booked to Méduse Smythe, the companion, was 360—it was to be expected. They had rooms together—probably also with a communicating bathroom. That was the matter for satisfaction. It was only when he had discovered Mr Neuburg's room that a feeling of anxiety crept into his thoughts. For, obviously, Mr Neuburg had the room next Méduse Smythe's. The gang had deliberately arranged to group themselves — and their victim — together. It probably went without saying that Méduse, the Gorgon, and Mr Neuburg also had a communicating bathroom. These hotels were so built that rooms intercommunicating like this could be used as suites, or, with the internal doors bolted, each room could be used separately. But there it was; they were all in rooms in line—the victim, Heloise, the gang, and himself.

Clement went quickly to his room, left the door ajar, so that he would not have to call out when the baggage-man brought his luggage up—to call out loud would be to warn Mr Neuburg—and went very quietly into his own bathroom. He felt the handle of his own internal door, found it bolted, slipped the bolt, and carefully opened it. The door of Mr Neuburg's room (there were double doors separating bedroom and bathroom) was shut, and it was probably bolted; anyhow, Clement was not going to attract attention by trying the handle. What mattered was that there was only a single thickness of door between him and the master-villain. He could hear the mountain of a man moving about quietly inside his room. He heard him mutter an angry oath—probably directed at his (Clement's) head; then, luck of luck, he heard him use his telephone. The message was of no importance. He was merely demanding his luggage from the porter, but it gave Clement the knowledge that, unless Mr Neuburg whispered, it would be quite delightfully easy to overhear his conversations. Nothing more happened then, and Clement closed his own door again, and bolted it, as he heard the baggage-man's trolley coming along the passage with his traps.

Only when that fellow had gone did he bolt his door, slip into the bathroom, and wait for

a conversation he thought was bound to come. Mr Neuburg, he felt, must open his bruised heart to the companion, Méduse.

Apart from shuffling movements inside Mr Neuburg's room, there was nothing audible for some time. Clement did not mind. He had an infinite capacity for showing patience.

Also, as he sat comfortably and waited, he could review the situation.

It seemed to him a very good situation to review. It seemed to him to be a rather ironic, but completely satisfactory, situation. He had been placed, by the girl's possession of the lawyer's letter, in a position of signal disadvantage with Heloise; then, by the action of the very gang itself, the whole aspect of the business had been quite abruptly reversed. It was he who was master now.

The rogues themselves had placed a weapon—indeed, two weapons—in his hands by their failure to bring about his arrest as a thief. That act had given him the one thing he wanted. It was an actual, tangible proof of their utter dishonesty. There was no longer merely vague suspicion. Here was fact. It was a fact that, given ten minutes' conversation with Heloise, he could drive home.

Could he doubt that? She was so essentially honest and honourable herself that this vile scheme to fix a crime on to his shoulders would convey only one meaning to her. It would tell her not merely that these people were unscrupulous, but that they were desperately and boldly unscrupulous; that they would stick at nothing in order to remove any one who came between them and their ends, who attempted to protect her against them. She would see that a crime like this—a definite crime, not an unsupported suspicion—simply showed that the brutes must be engaged in a larger criminal plan.

Oh, a girl of Heloise's staunch and clear nature would be able to understand. And that understanding would be driven home when he told her the facts of the lawyer's letter which had been used to estrange them. Clement did not know for certain how that letter had come into Heloise's hands, but it was fairly apparent that the companion, Méduse Smythe, must have been used as a channel. Anyhow, Clement thought so. Well, when Heloise learnt that her precious companion had deliberately given her a letter deliberately stolen from his despatch-case for the purpose of erecting a barrier between them, she would be able to estimate fully the honesty of that companion.

The cunning plot connected with the tiara was damning evidence. That plot not only made the theft of the letter easier to relate, but made the whole case against the rogues more convincing.

Yes, it was an excellent situation, with all the cards in his favour. The rogues had been bold and daring. He would be equally bold, equally daring. He would state the whole of the facts without mincing matters. He would expose the rogues to Heloise. She could never trust them again, or the story of the fortune in those mines that only needed backing to yield immense riches. And even—unlikely contingency, Clement thought—if she persisted in her journey, went to Sicamous to see her girlhood's sweetheart, Henry Gunning, she would go there not favourably impressed with his honesty. She would already have a feeling against him.

Ten minutes' conversation with Heloise, and it would be all over with these rogues. That conversation, perhaps, would not be easy to obtain; but it would be obtained. He would see to that.

'Ah—it is all right, Méduse? You are free? You are alone for a few minutes?' A deep, slightly muffled voice said these words curiously close to Clement Seadon's ear.

It was Mr Neuburg speaking. The companion, Méduse, had come into the room on the other side of the bathroom door.

II.

'Don't talk, woman,' said Mr Neuburg's voice. 'He is here, in this hotel.'

'He? Who?' gasped a female voice. It was a little fainter than that of Mr Neuburg, who, Clement was delighted to hear, was in that masculine condition of rage when he must 'take it out of' some one.

'Don't be a dense fool,' the big man snapped. 'He? Who? The Englishman, ninny. Is there another?'

'It is impossible. He has been arrested.'

'Pah! Do I have to keep on saying it? He is here. He has not been arrested. He is somewhere in this hotel *now*. The Englishman is here. The Englishman, Clement Seadon, is here. He is here. He is in this hotel. He is free. Do you begin to gather—just a glimmer, woman?'

'But'—the woman's voice was almost scandalised—'but he was to have been arrested. Molke was to see to it that he was arrested.'

'And he is not arrested. It is Molke who has been arrested.'

Clement heard the creak of a chair. The fact had been too much for the amiable Méduse. She had had to sit down—and sit down hard. Clement heard a smothered feminine ejaculation. He would have liked to chuckle. He durst not. The snarling voice of the mountainous Mr Neuburg said with bitter passion, 'Ah, you begin to see. Something active begins to stir in your head. And you are shocked. Well, I did not thrill with joy myself. No, I do not know how it happened. I only know I set Molke to effect this Englishman's arrest, and it doesn't happen; it is Molke who is arrested instead.'

'Yes; but that—*that* Englishman,' protested an incredulous female voice.

'Yes — *that* Englishman. Only, my dear Méduse, say "that Englishman" with more respect. I assure you he is like that. He is to be respected. He does not look like intelligence at all. He looks a mere decoration. He looks a mere easy-going, meaningless, drawing-room young man without any wits of his own. And—and it is Molke who is arrested, after all. Just appreciate the fact, my dear. That is the English. They do not look like anything in particular, and you find them sitting firmly on top of you just at the moment when you are beginning to rub your hands over the clever way you have knocked them down.'

'But—but Molke had him so tight.'

'So tight,' snarled Mr Neuburg, 'that Mr Clement Seadon walked, smiling and calm, into the lobby of the hotel, and, still smiling, still calm, told me to my face that he had beaten me at my own game.'

'He—*he* told *you* to your face?'

'In his own way, of course. He told me that he was not in prison, but that the steward Molke was. I am not so dull that I did not understand him completely. But—but, you see what it means?'

'That — that' — the woman was a little flustered before the bullying anger of her companion—'that means he is still a danger we have to contend with.'

'Women,' said the mountainous Mr Neuburg —'women are the apostles of the obvious. Yes, he is a danger we have to contend with, my dear. Only, he is something more. It means that *he* thinks *we* are a danger that no longer counts. I see I shall have to explain. This is truly your day for being heroically dull. This man who looks foolish is not. He knows that we have delivered ourselves into his hands. He is going to strike—strike once and swiftly—and smash us. He will expose us to Heloise Reys. Understand that. He will expose us boldly—and we shall be done. That is why he is so confident. His sort do not taunt for the mere sport of the thing.'

Clement smiled grimly, appreciating the acuteness with which Mr Neuburg had sized up the situation. Mr Neuburg, also, was no fool.

'Heloise will not speak to him,' said the woman.

'He will speak to her. It will come to the same in the end. Oh, yes, I tell you that is what he will do. He is not a man to miss chances.'

'We will prevent that,' said the woman.

'We will do our best to prevent that,' said the man.

Clement knew they would. He knew that to get that ten minutes' talk with Heloise would not be an easy matter. He knew that the rogues would fight him to the last. But he meant to speak to Heloise. He would speak to Heloise.

He listened intently. Since they meant to prevent his speaking to the girl, they might say how they meant to do it. He might, thanks to his splendid good luck, overhear their plan for checkmating him. That would be a crowning triumph. He listened. A silence settled down on the other side of the door. Were they thinking out a plan for removing him? Then, surprisingly, astoundingly, Neuburg growled, 'But there is something else. Gunning has broken loose again.'

Clement gasped—and so did the woman. But where his gasp was one of astonishment, that of the woman was one of anger. There was a distinct pause before she answered, 'Ah, that was what made Joe look so sour on the quayside. I saw he was there,' she gasped. 'Well, what is it now?'

'It is not revealed,' said Mr Neuburg, being, apparently, sardonic. 'Nor is it revealed to where he has—vanished.'

'Vanished! You mean, he's left Sicamous?'

'My dear Méduse, he always leaves Sicamous, doesn't he? He is behaving as he always behaves—the slack-willed, backboneless swine.'

Clement registered that character-reading of Henry Gunning in his mind. Gunning was even as he had suspected—a swine. Assuredly fortune was smiling on him to-day with her most genial smile.

The woman on the other side of the door suddenly showed a flash of spirit.

'Just stop being clever, Adolf, and tell me exactly what Joe Wandersun told you on the quayside.'

'He told me that Henry Gunning had been Henry Gunning. He got drunk, as usual. He talked big about his idiot mine claims, as usual. He boasted about the millionaire he'd be when his soft-hearted English sweetheart married him —I suppose that's as usual now. He then got a little drunker. Told the world that he was going to strike the trail and "show 'em all." And he struck the trail—and—so—vanished.'

'And Joe sat down on his hunkers and watched him go?' said Méduse bitterly.

'Leave Joe to me, my dear.' There was a nasty edge to the big man's tone; the position of Joe was not enviable. 'Joe says that the brute sneaked off in the night. Joe left him apparently sleeping the solid sleep of "bootleg" whisky in his shack. He thought he was safe for eight hours. When he went there again in the morning, Gunning had gone. He had taken his kit, slipped off somewhere in the dark, and had vanished.'

'Well?' snapped the woman after a pause. 'It doesn't stop there, does it? Joe didn't just sit down and weep, did he? What's he found out?'

Mr Neuburg chuckled. Through the door Clement heard it distinctly. Apparently the massive rogue took a brutal joy in baiting the pleasant Méduse.

'You are unerring, my dear,' he said. 'As

you imply, our good Joe did not sit down and weep. People who work for Adolf Neuburg know better than to sit down and weep—so. Our Joe has found out things. Not everything, but something. This sodden and spineless Gunning struck east. No, my dear, do not spoil your burst of intelligence by asking the obvious. If I knew exactly where he had gone, I should have mentioned it. You appreciate that? When one fails to mention things, it is because one doesn't know. But we will know. Siwash Mike is finding out. He will find out. That is his forte. In a day or two we shall know where this fool Gunning is.'

The woman vented an exclamation.

'Ah, you see that that is the point, my mild Méduse. In a day or two. That means, perhaps, a day or two longer here in Quebec, with that foolish-looking Englishman, who is far from foolish, on the spot. The situation is not excellent.'

The pair were silent for a moment. Clement, with ears straining, wanted to learn answers to several questions that passed through his head. The blackguard pair knew that Henry Gunning had left Sicamous, had disappeared. Did Heloise know, or would she know? And how would she know? Obviously she was to be kept in Quebec until her old sweetheart's whereabouts were ascertained. How would that be managed?

As though his thoughts had been communicated telepathically through the door, his speculations were immediately answered.

The voice of the big man boomed abruptly, 'She has gone out to the Post-Office, eh?'

'Yes,' said Méduse. 'She has gone to see if the letter is there.'

'It is there,' said Mr Neuburg. 'Her agent at Sicamous—our good Joe—sent it before he left. He showed me a copy. He did quite well. He informs her that Henry Gunning has left Sicamous on one of his periodical trips—probably on business. He does not know where Mr Gunning has gone, but he will cable when he finds out, or when Mr Gunning returns—as he should in a few days.'

'That, I suppose, will not make her suspicious,' said the woman.

'What is the matter with you, Méduse?' snarled the big man, with an oath. 'Where is the reason for suspicion? Gunning—the fool—is not supposed to know she is coming. If he likes to go off—well, it is merely a natural thing for him to do. If anything, his going off destroys the suggestion of a plot, of his being kept there by us as a bait for her. You are a fool, Méduse. This Englishman—he is destroying your nerve.'

'Yes, it is the Englishman. He is too unexpected. I do not like the idea of our remaining here several days with him about.'

'Well, you know his capacities; it will help to keep you alert. And we will deal with him—as best we can.'

Clement, hearing that he was to be dealt with, was grateful for the hint. He also appreciated the great regard they seemed to have for his abilities. Excellent though the tribute might be, he saw that it did not point to his task being any easier.

The woman said, 'Still, would it not be better to get her away? Would it be possible?'

'It would be better, but not possible,' said Mr Neuburg. 'We must remain here, in touch with the Sault Algonquin. Siwash is to report there. He is "in the air," as it were, and that is the only way we can keep in touch. No, my dear Méduse, it will not suffice that he cables. He will cable Sicamous, and Joe's wife will send on the message to our soft-hearted little girl. But the cable is not good enough for us. We must know all the details—what Gunning is doing, what is his condition, and so forth—in order to know how to act. No; we must stay in Quebec until we see Siwash.'

'And Joe is staying too?'

'Yes; he is at the little glue-maker's in Algonquin. I see what you mean. He will be an addition to our forces if we have to deal with that Englishman. Joe is a useful man. He may be slow at times, but he is not squeamish.'

Again Clement Seadon was glad of the hint. He would adopt a special alertness for the benefit of this unknown and unsqueamish Joe. But, more than this, he was exceedingly grateful for the address they had given him—the glue-maker's in the Sault Algonquin. He rather fancied he knew the street. It was one of those in the old town, in that network of dark and narrow alleys crowded between the water-front and the rocky cliff on which Quebec was piled up. The knowledge of that address might prove useful. It was good to know the local headquarters of the gang. Also, Siwash Mike—whoever he was—was to report there. It would be interesting to hear that report. One might gather a great deal of useful and instructive information about Henry Gunning and the plans of the gang from it. As he sat there quite comfortably, listening, Clement Seadon drew out his pocket-book and wrote down, 'The Glue-maker's, Sault Algonquin.' He would have a look at that place, reconnoitre its possibilities.

Then, even as he wrote, even as he listened, something happened. The woman Méduse was saying, 'Yes, something must be done about this Englishman. I assure you, Adolf, I do not feel secure with him about. It is not merely that apparently his easy-going appearance covers an unnatural cleverness—but—but—we must not mince matters—he has an effect on this girl Heloise.'

There was a pause. Clement felt that the big Mr Neuburg was impressed by the significance of the companion Méduse's words. He knew that he himself was certainly impressed

by the significance of Méduse's words. His heart had suddenly leaped. His brain was singing. He could scarcely restrain himself from calling out, 'Say it. Say what you mean plainly.' And, as before, it was as though the intensity of his own feelings compelled those in the farther room to be explicit.

'Ah,' breathed the mountainous man, 'you mean that she is, perhaps, in love with him.'

'I mean,' answered the woman, 'that it would be very easy for her to be in love with him. I do not think she knows it yet. But he—he would quickly make her know the state of her heart.'

'Thank you,' Clement almost cried aloud.

'That is the devil,' said the big Mr Neuburg, and his was the only comment that was vocal. 'We must certainly deal with him.' And then came the unexpected happening. 'We must certainly deal with him before he scores that advantage,' said Mr Neuburg, and on top of that amiable remark the woman hissed—

'Shiss, one moment.'

There was a sound of stealthy and swift movement in the room. A silence. Presently another movement of skirts, as though the woman was returning from a farther chamber. Then, 'It is she. She has returned from the Post-Office. I hear her moving in her room. I must go to her before she finds the bathroom door locked.' It was the companion, Méduse, speaking softly.

Again movement. Again silence—a long silence. Clement heard the scratch of a match, smelt cigar-smoke, heard a chair complain as a heavy body dropped into it. Then once more silence.

Mr Neuburg had sat down to think things out.

Clement shut his own bathroom door noiselessly, noiselessly bolted it.

The séance of eavesdropping was over.

(*Continued on page 164.*)

RECENT PROGRESS IN WIRELESS.

By Lieutenant-Colonel C. G. Chetwode Crawley, M.I.E.E.

I.

THE advances made in wireless communication during recent years have been so much screened by the secrecy of war that the most astoundingly inaccurate statements are often published in the daily press. What ink and time, but not thought, were spent in writing and reading about signals from Mars; and still we write to newspapers about their 'valuable space'! Surely the facts concerning wireless communications as they now are and the lines on which progress may reasonably be expected are interesting enough without continually pursuing the remote possibilities, or, as in so many cases, the never-ending impossibilities.

Let us just look at these facts and see how wireless communication stands to-day compared with its position in 1913. In 1913 we were reading about an imperial wireless chain, and in 1920 we read about another one, in the report of a committee appointed by the Government. The erection of the 1913 chain was rudely interrupted by the events of 1914, but what are the outstanding differences between the two schemes which mark the progress of long-distance wireless telegraphy? In each scheme it was suggested that, to link up the Empire, stations should be erected at distances from each other of about two thousand miles; but in the 1920 scheme it is proposed to use less power and to work duplex—that is, sending and receiving simultaneously at each station—at high speeds, in a way which was not contemplated in 1913. What is it, then, that now allows of less power—which means, of course, less cost—and of higher speed? It is the use of a new means altogether of producing wireless waves. The apparatus now proposed is called the three electrode thermionic valve, an imposing and formidable name for a piece of apparatus which consists essentially of a vacuum bulb, similar to an electric-light lamp, but with two other metal elements inside the bulb in addition to the filament. The whole romance of wireless during the war is wrapped up in the development of this little piece of apparatus for transmitting and receiving messages.

At the outbreak of war the valve, as a receiver, was just beginning to emerge from the experimental stage, but as a transmitter it had only entered that stage, and was not in extensive use as such for the first few years. For receiving purposes it came into prominent use when the French, early in the war, followed quickly by ourselves, used it for reading enemy messages sent by their land-lines to the front-line trenches. The Germans soon followed suit, and much surprise was expressed at the time as to the intimate knowledge which the enemy possessed of our movements in the front-line, similar surprise as regards our knowledge of the enemy's movements being no doubt just as prevalent in Germany. The fact is that the valve can be used not only as a most sensitive detector of wireless waves, but also as a most efficient sound-magnifier when coupled up with suitable circuits. Both sides naturally lost as little time as possible in arranging to send their land-line messages by means which could not be so easily tapped.

Owing to the detecting and magnifying properties of valves, the strength of wireless signals

received can be made much greater to-day than was the case in 1913, a fact which facilitates arrangements being made for receiving messages sent at very high speeds, a speed of a hundred words a minute being now quite a practical proposition for long-distance working. Much greater speeds have been demonstrated experimentally, and will no doubt be possible for commercial long-distance working in the near future.

The first practical demonstrations with a valve as a transmitter were given in this country just before the war, and its developments during the war were chiefly in connection with transmitters for small sets, especially those in aircraft. The waves radiated by this method are very suitable for all wireless communications, and much greater distances can be obtained than with other wireless transmitters using the same power. The valve is not, as a matter of fact, in use as yet for any very long distance work, but the Government committee considered its development sufficiently advanced to justify their recommending it for use in an Empire chain of two-thousand-mile stations. Many of the larger Atlantic liners are now being fitted with valve transmission, and communicate with similar stations on shore up to ranges of about fifteen hundred miles, more than double those obtained in 1913. None of these ships, however, is yet fitted with high-speed apparatus, and the messages are sent by a hand-worked signalling-key at about twenty words a minute; but if later on the amount of traffic justifies high-speed working, the necessary arrangements can easily be installed.

II.

The development of wireless telephony has always lagged far behind that of wireless telegraphy, but the introduction of valve transmission and reception is giving it an impetus which will assuredly carry it far. During the war most of the experiments with wireless telephony in Europe were directed towards the development of small sets for use in aircraft, and towards the end of the war aeroplanes were communicating comfortably up to ranges of fifty miles with their ground-stations, and up to five miles with each other—ranges which have since then been more than doubled. In the United States, however, during the early stages of the war, more time was available for experiments in long-distance wireless telephony, and spoken messages from a station near Washington were read in Paris, a distance of about two thousand three hundred miles, and sometimes even in Honolulu, about five thousand miles away. No such long-distance telephony, however, is yet in practical operation. Recently in this country the Marconi Company arranged for Dame Melba to sing into a wireless-telephone transmitter at one of their stations, and the songs were clearly heard at many stations on land and sea up to a distance of about a thousand miles. At present there are no wireless-telephone stations in operation for ordinary commercial working. There is, however, no great difficulty in linking up wireless with line telephony, so as to have the speech transmitted partly by wireless and partly by land-line, a possibility which at once opens up a new field for prophecy and speculation. It was, indeed, by this means that President Wilson received wireless-telephone messages from Washington when in mid-ocean on his return from the Peace Conference. Already wireless telephony is showing its first great practical use in peace, as it did in war, for aircraft communications, and what pilots considered a few years ago as a perfect nuisance has now blossomed out as an essential fitting. The late Lord Kitchener was much impressed by one of the first successful demonstrations of wireless telephony from aeroplanes. The demonstration was given to him at St Omer, but unfortunately for immediate progress the messages were read as far away as Lowestoft, a fact which caused orders to be issued prohibiting the use of wireless telephony for quite a long time, as it was feared that the enemy might read the messages and obtain valuable information.

Wireless telephony suffers, of course, from all the same troubles as have clogged the progress of wireless telegraphy from the start, rapid as this progress has been. Interference of one communication with another, and interference from disturbances in the ether, called atmospherics, are even more serious in telephony than in telegraphy. These troubles are decreasing every day, but they are still large enough to remind us that wired working might have been looked upon in many ways as a great advance on wireless had it not become a familiar commonplace before wireless entered the field.

Another aspect of wireless which proved of great use in the war, and depended mainly on the development of the valve, was that of direction-finding. For this purpose the circuits at a receiving-station are arranged so that, on signals from any station being heard, the direction of that station is at once known, and, if required, the exact position can be found by plotting its directions from two or more receiving-stations. This arrangement was used extensively by us in the war, especially for locating the positions of enemy submarines, and it was by this means that raiding Zeppelins often steered their course, making use of signals from German high-power stations. In the navigation of aircraft this wireless direction-finding is of the greatest value, and it is also being used to assist in the navigation of ships, especially in foggy weather.

Wireless waves can, of course, be utilised for transferring energy for purposes other than communications and position-finding, such as for steering boats or torpedoes from a distance, and for the transmission of photographs; but such uses are still so much in the experimental stage that it is unnecessary to dwell on them here.

LIKE MY SON JASON.

By JOHN HASLETTE VAHEY, Author of *Johnnie Maddison*, *The Passion of the President*, &c.

THE park and the old house of Wych Cotes lay dreaming in the hot stillness of an August afternoon. Not a leaf stirred on the great beeches surrounding the great house; hardly a sound echoed, unless it were the cooing of the ring-doves in the trees, which sounded near and hoarse in the quietude of the windless day.

The park-lands sloped down to the valley of the Wych Brook, and there a light blue-gray mist floated diaphanously over the stream, a heat haze rather than a mist, that softened and beautified everything over which it swam. To-day this country was a dream, with the magnificent trees set like green sentinels about the greener slope, until woodland met bosky shrubberies, and shrubberies melted by delicate gradation to rose-bushes, and ended with the bright flowery parterres about the house, the neat, fine-gravelled paths, overarched here and there by pergolas almost hidden by their burden of rambler-roses.

The lawns were close-shaven as any college lawn in England, velvet-green beds, but no one walked upon these delightful carpets of fine grass, no one showed himself on the paths or at the windows; the old house dreamed in its own shadows, mellow with the restful silence of great age happily arrived at and contentedly survived. One thin flag of smoke went up from a cluster of Elizabethan chimneys, waved a little, and melted into the sky; two pigeons swept out from the great cote which had given the house its name, and circled about the gables; and down in the fish-pond by the dingle a great carp lazily nibbled at a water-weed.

On the sunny slope above the fish-pond there grow three giant beeches, and near them stands a little garden house, like a miniature Greek temple. A dappled shade is there, the shining sun overhead chequering the ground under the trees, darting golden lances through the arch of green leaves; and on this particular August afternoon a hammock had been slung between two of the smooth tree-boles.

The financier lay in the hammock, sagging it with his relaxed bulk, and his massive head lay back upon a pile of crushed silk cushions, his immense mouth half-open, the rolls of his flaccid chin loose in the betraying limpness of sleep. It was not an attractive face, even when the big jaw was closed with its business expression, which made it like a rat-trap. Powerful no doubt, but gross too; sensual, cruel, brutally material.

The silence that was elsewhere broken only by the cooing of the doves was here vulgarly disturbed by a sound, half gurgle, half snore, which came from the sleeping man. He slept as he waked and lived—largely, noisily, flamboyantly, without delicacy or consideration. A little table stood near the hammock, and on it rested a financial paper, a decanter half-full of whisky, and a soda-water siphon, with a glass.

The sleeper had other claims to the consideration of the public than that of being a financier; he was also a discoverer. It is true that he had discovered nothing likely to uplift mankind, to soothe pain, to profit humanity; but he was a discoverer none the less! Early in the Great War he was the first man to discover that neither the War Office nor the innumerable hosts of regimental sergeant-majors expected the British soldier to shave with the razor supplied him by the nation. Each carried one (as he carried a potential field-marshal's baton) in his pack, but shaving was one of the uses to which it could not be put.

The regimental razor was, then, largely an ornament, and as such need not be either sharp or expensive. That was the value of the financier's discovery. Oblong pieces of metal set in composition handles might be bought by the million for about threepence apiece, if one was not expected to shave with them. They could also be sold in millions for about ninepence to an authority which demanded a clean chin daily from every serving soldier.

'It isn't as if the poor beggars had to shave with the things,' the financier said to his wife when the idea first struck him. 'They've got to have 'em, that's all.'

A little fortune soon grows when you put it out at 200 per cent. or so, and the financier went on from strength to strength as the war proceeded. He was the first man to make plums and apples out of mangolds, the first to put on the market one of those weird brands of cigarettes which proved that a weed might nominally smell as sweet as real tobacco and be something far removed from even first cousinship to it.

And now the war had been over for nearly two years, and the financier had run the gamut through Hackney and Hampstead to Hertfordshire and Park Lane, and slept the sleep of the well-fed animal in a hammock between the ancient beeches of Wych Cotes.

A young man came suddenly from behind the little classic temple, and stepping noiselessly towards the clump of beeches, looked at the figure recumbent in the hammock.

He was over the middle height, muscular, and erect. His face was almost handsome, with brown eyes set squarely in a tanned face, an aquiline nose, a sensitive mouth, shaded above by a short, trim moustache, and a chin that was firm and slightly cleft.

It may have been his gaze that broke the slumber of the financier, or the attentions of a

lazy blue-bottle that swung and droned about his sagging chin, but he sat up, opened his eyes, and fixed them in surprise upon the figure of the young man in the well-worn tweed suit, who leaned against the bole of one of the beeches, regarding him.

'Hello! Hello!' he said awkwardly. 'I was asleep, I s'pose—it 's so damned hot'——

'It is hot,' the young man agreed quietly.

The financier suddenly remembered that this was his hammock and these were his grounds. 'How did you get in here?' he asked, half-aggressively. 'This is private property, I'd have you know, young man!'

The young man bowed slightly. 'I am sorry if I intrude. I used to live here years ago, and I thought I should like to look at the old place again.'

The financier opened his eyes. 'Lived here, did you? Think of that now! Well, have a drink, will you? You 'll find Scotch on the table there.'

'No, thank you, sir,' said the other.

'As you like. . . . When did you live here, may I ask?'

'Before the war, sir—funny thing, it began this month, almost about this time.'

The financier grunted, 'The war, did it? Well, I can tell you, young man, I 'm fed up with war talk. Had my fill of that when it was on. I don't say I didn't do well out of it, for I did; but it 's ancient history now, and the sooner it 's all laid up in lavender and stored away the better. Why, bless you! my office is full o' chaps who 've been to the war—and a nice lot of swankers they are. I don't know if you 're in business, young fellow, but I can tell you that the fellows who came back to offices aren't half the men the other fellows are—they 're too big for their boots; they 've acquired lazy habits, mark my word! I hope that doesn't apply to you?'

The young man laughed a little bitterly. 'I hope not, sir.'

The financier looked at him. 'Were you in it?'

'Less than a year,' said the other quietly.

'Ah, you were one of the sensible ones, like my son Jason,' said the financier. 'When the war broke out, my son Jason came to me and asked me did I expect him to go soldiering; and I said to him, I said, "Jason, there 's a lot of idle fellows about who won't hurt for a bit of work and occupation. But men like you and me have our businesses to attend to, Jason. We have to keep things going, to stick to the old ship. You stay with me, my boy; and when they really want you, they 'll call for you. Any one can fight, but it isn't every one who can make money and provide the sinews of war."'

The young man nodded. 'And what did Jason say?'

'Jason he says, "Right, dad; that 's just what I say. The regular soldiers are in it because they have to, and the other fellows just want to swank a bit before their girls. It isn't the fighting that attracts them, but the uniform. If most of them had anything worth while having, they wouldn't give it up so easy, not by a long chalk!"'

'Don't you think some of them did?'

'Mighty few, young man; mighty few. Supposing now one of them owned this place—do you think he would give it up and make a cockshy of himself over in France, when he might be living in comfort at home? It wasn't done! Why, you used to live here, you say, and you had only a year of it, same as Jason. He had to go in the end; though I 'm happy to say we got him a job as O.C. Stationery at home.'

'Did he care for that?'

The financier pursed his lips. 'Well, I can't say that he did. Often he used to curse it all ends up, and it 's my belief he hated it from the beginning.'

The young man smiled. 'Most of them tired of these jobs, and hankered to be out at the front.'

The financier opened his eyes still wider. 'Out at the front? Did I say he wanted to be out there? What I said was that he hated this soldiering job with stationery; and so would you, too, if you were used to living well at home in a big house, with servants to wait on you, and no need to get out o' bed till ten in the morning. No; it was too like work for Jason.'

'Was he strong, or how did he get exempted?'

'Oh, Jason was strong enough. You don't see my point, young man. Brains aren't common, 'specially financial brains, and when a thing is rare, it 's got to be taken care of. If a man 's killed, he 's always a loss to the nation; but the nation 's got to decide that the loss shall be as small as possible. No sensible man 's going to fish for cod with salmon for bait; he uses up the common sprats, and keeps the expensive for use at home, if you get me?'

The young man frowned. 'But surely they were all men—all had souls, sir. I suppose they had mothers, fathers, and wives to mourn them?'

'Ay, very sad, very sad, no doubt,' said the financier considerately. 'But you can't bring souls to market, young sir, and it 's the markets that make the money. That 's what Jason said to me when the Conscription Bill came in. "Dad," he says, "the Government 's making a big mistake when it makes all men alike. What they ought to do is to ask each man what he can best give, and those that could give money could give it, and those who hadn't could give their muscles."'

The young man looked sadly down the slope over the sweet old park-land to the quiet fish-pond where he had played as a child. A

shadow played on his face as he replied, 'Had you to give much, sir?'

The financier puffed out his fat cheeks. 'Yes, young man. I was never behind-hand when it was a question of writing a cheque. Haven't you seen the War Memorial down in the village? Mine! I didn't spare any expense—and Jason said it would look well. I paid all my employees two-thirds of their salaries while they were away, and there was hardly a subscription list didn't have my name on it.'

The young man looked more hopeful. 'Excuse my asking—did you give that large sum early in 1915 for the Soldiers' Comforts Fund, marked "An Anonymous Father"?'

'No, young man, I did not; and if you ask me, I don't believe in sneaking about under anonymity. Everything above-board is my motto. You know what happened to the man who hid his talent, and that we are forbidden to hide our light under a bushel? Well, I never was ashamed of my name, and what I gave I put my name to. It helped a bit, I'll admit.'

The young man frowned. 'In other words, sir, you advertised yourself under the cloak of charity?'

The financier's mouth closed suddenly, like a rat-trap, and a heavy flush overspread his face, while his small eyes dilated. 'What the devil do you mean?'

'What I say, sir!' The young man's face flamed. 'What a shadow has fallen over dear old Wych Cotes! It is the first time it has sheltered a parasite, sir—a leech'——

'How dare you!'

'Dare? Is it daring nowadays to tell the truth? The war has passed, sir, and already you want to hear no more of it. Are you ashamed of the thing that made you, that gave you this, that fattened you and your son, and gave you safety at the cost of others' lives?'

The financier gaped. 'I like your dashed impudence, young man, insulting me and my son. Why, Jason, he'd make two of you. He has brains, has Jason'——

'And discretion—which is the better part of valour, sir.'

'Well, who are you to talk, if he has? Didn't you wangle out of it till you couldn't help it? Didn't you tell me you were just in it for a year—just like my son Jason. Get off my land, sir, at once, or I'll call my men, and have you *thrown* out! What d'ye mean by coming here, anyway—trespassing without a By-your-leave? I'll have man-traps put up! I'll see that no one runs over my property as he pleases, and insults me on my own ground.'

The young man drew himself erect. 'You need not trouble, sir; I shall not come again. Wych Cotes, as I knew it, has gone. You have driven away its memories, its peace. It is now nothing more than a house that encloses dishonour.'

The financier was purple now, and choking with passion. 'Wait till I get out of this 'ammick!' He choked and gurgled in his fury, as he struggled into a sitting position and dropped one heavy leg over the side of the hammock. 'Old as I am, I'll damn well teach you to'——

He got to the ground and looked about him. But the young man had gone noiselessly away among the trees, and after glaring about him with futile rage, the financier stumped off towards the old Italian garden, where Hobbs, the head gardener, was standing before a tall cypress.

''Obbs! 'Obbs, I say!' he cried, his veneer peeling from him as passion shook him. 'Some young man's been trespassing here. He woke me up in the 'ammick. 'Aven't I given orders no one was to be let in without my permission?'

'Yes, sir,' said Hobbs respectfully. 'Was he one of the village young men, sir, or a stranger?'

The financier stamped. 'Thought himself a gentleman, anyway, impudent young cub. Said he used to live here once.'

'Then 'e must have bin a himposter, sir,' said Hobbs gravely. 'No one had Wych Cotes but the Redlys, until you came, sir, at January.'

'Thought so,' said the financier. 'This young feller would be about twenty-three. Not bad-looking, I'll admit, with brown eyes, and a tooth-brush moustache, as they call them, wearing a suit of greeny-brown tweed. Do you know any one like that round about?'

Hobbs stared. 'Had he—had he a sort of cleft—dimple—in his chin, sir, do you remember?'

The financier started. 'So he had. I saw it clear. He did live here, then, after all?'

Hobbs turned paler. 'It couldn't be, sir—not 'im! But 'e was the dead spit of what you say, sir—young Master James was, and just the suit he used to wear before he went to the war in 1914.'

The financier shook his head. 'You mean your old master's son?'

''Is only son, Master James, sir.'

'No, it couldn't be, 'Obbs. He said right enough that he lived here once, but he told me plainly that he had only been a year in the army. Likely they took him in 1917, under the Act.'

The head gardener looked down. For a few moments there was a silence, broken only by the persistent cooing of the ring-doves. He looked up again then, and some suppressed emotion made the muscles of his face twitch painfully.

'A year,' repeated the financier, 'just like my son, Jason.'

'Begging your pardon, sir,' said Hobbs slowly, 'Mr James was among the first to join up, sir, and he wouldn't have been in the army more 'n a year. He was killed in France in the end of July 1915.'

Chambers's Journal
SEVENTH SERIES

THE FOLK OF THE 'MAYFLOWER.'

By LAUCHLAN MACLEAN WATT.

PART I.

I.

A FEW months ago one of the most humanly interesting memorials of the world's history fell to be celebrated. It was the tercentenary of the Pilgrim Fathers—the sailing westwards of about one hundred English men, women, and children in a little ship, the *Mayflower*, to make the real beginning of the great American Republic. They felt impelled to go, not so much on account of religious faith as on account of Church policy. And they sought a field where might be exercised by them so much of democratic principle as is involved in the right of a man to follow what he is convinced to be the guidance of his conscience—the right to think in his own way, without hurt to his neighbour, and without being persecuted or oppressed in consequence of its exercise.

Those men and women took the Bible as their unquestionable rule of conduct, without a touch of criticism in their acceptance of it. It was not so much that they hoped to build a new Jerusalem as that they endeavoured to found a new England, free for themselves and all who thought like them, establishing a new divine right in place of the old, which had unfortunately marked kingship out already for doom, and involved the hierarchy as an agent for oppression. They were spoken of as narrow; but they were no narrower than those who crushed them over the edge of the land they loved, to face the ocean crossing; nor nearly so narrow as the whimsical fool who sat then upon the throne, setting himself up as God over the minds and souls of a free folk, to the subsequent sorrow and ruin of his race.

The record of their rise and their going, of their dream and their ordeal, is clearly told; and it makes a truly touching story. It is best read in Governor Bradford's History, with the freshness of an eye-witness.

In the State-house of Boston, Massachusetts, in 1918 I reverently handled the precious folio, carefully preserved and lovingly shown, containing the account of the enterprise of the little company of adventurers, in which its writer had his share. The book is almost a foot long, by about eight inches wide, and an inch and a half thick. It is covered with parchment, cracked, scaling, and stained; and scribbled over in places, as was the ancient habit, the name of Mary Bradford being legible among the scrawls. The last five pages contain a list of those who came first in the *Mayflower*, with information of their circumstances at the time of writing, particulars of their deaths, and of the children born to them. The volume is complete, except for one page, which was noted as amissing in June 1728.

At top of the first page is the note, quaintly spelled: 'This book was rit by Governor William Bradford, and given by him to his son mager William Bradford, and by him to his son mager John Bradford. rit by me Samuel bradford Mach 20, 1705.' There is also a note by Thomas Prince, of June 1728, as to his being authorised by Major John Bradford, grandson of Governor Bradford, to place the historical manuscript in the New England Library of Prints and Manuscripts, with the condition 'y^t He might have y^e Perusal of it while He lived.' Mr Prince also wrote a note acknowledging that the volume was only lent to him; and he added that he wrote this 'that sd Major Bradford and His heirs may be known to be the right Owners.' He inserted his book-plate; but written at the foot of it is the sentence, 'It now belongs to the Bishop of London's Library at Fulham.'

The History then begins, the first thirteen pages having their margins carefully ruled off. The whole manuscript, except a part of the last page, is in the excellently plain hand of William Bradford, who, in succession to John Carver, was the second Governor of New Plymouth, elected in 1621, and holding office till 1650, but for one period between 1635 and 1637. It gives the story of New Plymouth till the year 1647.

II.

The fortunes of the book itself are veiled in mystery from 1767 to 1855. From quotation in books on the subject, it was long known that Governor Bradford had written a narrative of the Plymouth Settlement. The historians and recorders, Prince, Hubbard, Cotton Mather, and Hutchinson, referred to it. But in 1767 it disappeared. Conjecture could only suggest that it had been destroyed when Governor Hutchinson's

 [*All Rights Reserved.*]

house was sacked, or that it had been carried away as loot in the British evacuation of Boston. There the matter had to rest. In 1844, however, Bishop Wilberforce published a History of the Protestant Episcopal Church in America, using extracts from manuscripts which he said he had discovered in the library of the Bishop of London, at Fulham. The book was not popularly read; but in 1855 Thornton, the American antiquary, came across a copy, which awoke his interest, as his friend Barry was writing the history of Massachusetts. Between them the suggestion sprang up that the passages which had arrested attention were probably quotations from Bradford's document. Joseph Hunter, the English scholar, was communicated with; and a visit to the bishop's palace resulted in the identification of the long-lost volume. A transcript was made and printed in 1856, by the Massachusetts Historical Society, with annotations by Charles Dean. It, however, omitted sixteen lines.

How the volume had found its place of shelter has never been clearly explained. Between 1729 and 1785 the colony was considered to be in the diocese of London for ecclesiastical purposes, registration, &c.; but after the Declaration of Independence in 1776 the colony, of course, established a public registry of its own. The five pages of names and family particulars were, therefore, most probably the cause of the volume's preservation. This fact also gave it the title by which it was known, namely, *The Log of the Mayflower*. This title is, of course, erroneous, as the actual voyage of the immortal vessel occupies only one short chapter of three pages; their troubles at starting, their return, and second outgoing making the chapter preceding.

On the identification of the manuscript there began a series of interesting negotiations for its transfer to its natural custodians in the great Republic, to which, from the dry facts of its content, as a record, it rightly belonged, and for whom it had a truly sacred interest.

There was a precedent, when the Library Society of Philadelphia returned, voluntarily, some original manuscripts of the time of James I. of England. In 1860 the first approach was made, through Archdeacon Sinclair. The Prince of Wales, afterwards King Edward, was about to cross the Atlantic; and the suggestion was expressed that he should carry the manuscript over the sea with him, and present it, as a British compliment, to the people of Massachusetts. Certainly nothing could have had more power to touch American sentiment; but, while the Attorney-General approved, the Bishop of London did not give his consent, on the plea that it was beyond his power to agree, without the sanction of an Act of Parliament. In 1869 Motley the historian, who was American ambassador to Britain, made a similar proposal, but again vainly. In 1877 an attempt was made to see the bishop on the matter, but his lordship was not at home. In 1881, at the time of the death of President Garfield, a suggestion was put forward in the press that the manuscript should be restored as an expression of British sympathy, but again nothing came of it. In 1895 Senator Hoar saw Mr John Morley, who declared his agreement with the sentiments of the Republic; and, by arrangement, the senator saw the book itself. But the bishop now said that the matter would probably lie finally with the Archbishop of Canterbury. So the affair dragged once more. But Temple went to Canterbury, and Creighton succeeded him in the London See. His historical mind saw more in the interest of the book than his predecessor, who had expressed some wonder at the request of America; and in 1897, during the jubilee atmosphere of Victorian enthusiasm, when Mr Bayard was ambassador, a petition was presented to the Episcopal Consistorial Court of London, signed by him and by the bishop, in terms of which the precious document was at last handed over to its proper guardians in the land of its origin. The restoration had conditions attached to it. The governors of Massachusetts were to be, for all time coming, responsible for its safe custody; and access was to be had to it for reference, especially in regard to matters of pedigree, it being, in fact, recognised as an authentic and legal register. So it lies in its case in the State-house in Boston, the most sacredly treasured thing in America, perhaps the only movable article in the Republic that is entirely beyond price.

III.

The purpose of Governor Bradford's History is made perfectly clear by the title of it, thus:

'OF PLIMOUTH PLANTATION,

and first of y^e^ occasion and indusments ther unto, the which that I may truly unfould I must begine at y^e^ very roote and rise of y^e^ same, The which I shall endevor to manefest in a plaine stile with singular regard unto y^e^ simple trueth in all things, at least as near as my slender judgmente can attaine the same.'

It opens, accordingly, with a reference to the 'warrs and oppossissions against the Saincts . . . ever since y^e^ first breaking out of y^e^ lighte of y^e^ gospell in our Honourable nation of England' . . . with 'Satan's more secrete and subtile means by kindling y^e^ flames of contention and sowing y^e^ seeds of discorde and bitter enmitie amongst y^e^ proffessors & seeming reformed themselves,' . . . and especially the quarrel between the ritualistic established church and those who desired to have 'y^e^ right worship of God & discipline of Christ established in y^e^ church according to y^e^ simplicitie of y^e^ gospell, without the mixture of men's inventions, & to have & to be ruled by y^e^ laws of God's word dispensed in those offices and by those officers of

Pastors Teachers & Elders &c, according to y^e^ Scriptures.'

Puritanism did not in itself mean separation from the Church of England; but the persistent oppression of it drove it out; and the departure to Massachusetts meant final separation. In 1581 the Brownists or Independents had arisen in England, whose claim was that every congregation was a self-contained and self-governing entity. In certain districts the sect flourished, and in Raleigh's day there were something like twenty thousand of them. The Pilgrims of Plymouth were of these; and long before they had set foot upon the *Mayflower* they had separated and founded communities. Their differences being, however, not on matters of faith, they and the Puritans easily united in America. The section to which the Pilgrims belonged met in the house of William Brewster, elder, at Plymouth. This was a man of strong personality, who had been associated with Davison, Secretary of State to Queen Elizabeth, and her ambassador to Holland, whither Brewster had accompanied him. Later he settled at Scrooby, not far from the border of Lincolnshire, and near the high-road from York to London. Their most notable minister was Mr Robinson, whom Robert Baillie called 'the most learned, polished, and modest spirit that ever separated from the Church of England on account of the persistence that he should obey her ceremonies.' The church at Scrooby was the citadel of the Pilgrims' community. The result of the petty oppressions was, of course, flight; and it meant not the expulsion of the most wretched and useless citizens of the State, but the loss of splendid grit of manhood and womanhood. It was, finally, as stupid for the Mother-Country as was the Revocation of the Edict of Nantes for France. And it carried abroad seeds which took root vitally, with wondrous fruit for a later day.

The persecution of the communities is a historic fact. 'Some,' says Bradford, 'were taken and clapt up in prison, others had their houses besett & watcht night and day & hardly escaped their hands: and y^e^ most were faine to flie and leave their howses & habitations and the means of their livelehood, seeing themselves thus molested . . . by a joynte consente they resolved to goe into y^e^ Low Countries wher they heard was freedome of Religion for all men . . . as also how sundrie from London & other parts of y^e^ land had been exiled and persecuted for y^e^ same cause, & were gone thither and lived at Amsterdam, & in other places of y^e^ land. So after they had continued together aboute a year, & kept their meetings every Saboth in one place or other, exercising the worship of God among themselves notwithstanding all y^e^ dilligence and malice of their adverssaries, they, seeing they could no longer continue in y^e^ condition, they resolved to get over into Holland as they could, which was in y^e^ year 1607 and 1608.' Such a step was by many considered 'an adventure almost desperate, a case intolerable, and a miserie worse than death,' and all the more as they had been accustomed to 'a plaine countrie life, and y^e^ inocente trade of husbandry.' Notwithstanding this truly English shrinking from the foreigner, 'these things did not dismay them,' for 'they knew whom they had beleeved.'

IV.

It is pretty evident that without this first venture into a strange world, the wider pilgrimage would probably never have been faced by them.

It was not easy to achieve their resolve, for 'though they could not stay, yet were they not suffered to goe.' Ports and havens were closed against them, and watched diligently. They had to bribe shipmasters, and pay exorbitant fees for a passage. And often their confidence was betrayed by the greed of those they dealt with, their goods captured, themselves detained, their money lost.

One community established in Amsterdam fell into strife with the churches of the city. So they removed to Leyden after about a year. There they worked hard, 'valueing peace and their spirituall comforte above any other riches whatsoever.' And they attained a large measure of ease. Mr Robinson, their minister, and Mr Brewster, their elder, evidently had the secret of orderly unity and industry. The community achieved respect, and won the trust of the Dutch in business and finance; 'yea, they would strive to get their custome and to imploy them above others in their worke, for their honestie and diligence.' Twelve years passed; and then 'the grave mistris Experience haveing taught them many things,' they felt they ought to remove elsewhere, and this for many reasons. Old age was creeping over some of them; their young people were mingling with the Dutch, and apt either to lose their individuality or to scatter; some became soldiers, and some went far voyages at sea. The peace between Holland and Spain was coming to a close; the drums and weapons of war were being taken down from the walls again. And, lastly, which was not least, what stirred them most was 'a great hope & inward zeall they had of laying some good foundation, or at least to make some way thereunto, for y^e^ propagating and advancing y^e^ gospell of y^e^ kingdom of Christ in those remote parts of y^e^ world; yea, though they should be but even as stepping stones unto others for y^e^ performing of so great a work.'

They were met, however, by objections on the part of some of their company, in consequence of the voyage, and the possibilities of famine, nakedness, and hardship awaiting them in the strange land. Grave debates took place as to whether Virginia or Guiana were more suitable. In regard to the former, it was feared that the

English already there would be certain to trouble them about their religion, if they settled in that region; while, if they settled at a distance, it would mean all the more remoteness from help in time of need. Guiana was open to Spanish aggression, which had already ruined the French settlers there. At length it was agreed to endeavour to get permission to live as a distinct body under the Government of Virginia; and two delegates were sent to England to try to obtain a patent from the Virginia Company. At the same time it was hoped to get, in some way, the royal sanction for freedom in the exercise of their religious practices. In that respect, however, all they could secure was an understanding that, if they proved peaceable, their presence and their practice might be winked at.

Finally a patent was granted them in name of a domestic of the Countess of Lincoln, though later on he did not go with them. For finance they were in the hands of London merchants, who advanced them money on shrewd terms, though difficulties early emerged here, some of these withdrawing, and some of the company shrinking from the adventure. The Amsterdam set were not considered acceptable, by reason of their quarrelsomeness. It was agreed that those who went should be absolutely a Church of themselves. Their whole stock was about seventeen thousand pounds. One ship, the *Speedwell*, of sixty tons, was bought and fitted up in Holland, and another, the *Mayflower*, of one hundred and eighty tons, hired in London. Those whose resolve was firm were accompanied by the brethren to Delfthaven, where the ship lay ready; and, with tears and prayers, the long farewell, final for many, was taken, 'y^e^ tide (which stays for no man) calling them away.' A footnote says, 'this was about 22 of July.'

(*Continued on page 179.*)

THE MOUNTAINOUS MR NEUBURG.

CHAPTER III.—*continued.*

III.

THERE is no doubt that Clement Seadon felt extraordinarily satisfied and confident. There was every reason for these emotions. He had, he felt, the defeat of Mr Neuburg and his gang completely in his hands.

He personally knew enough, and had overheard enough, to convict them of fraud up to the hilt. He had learnt enough to prove to Heloise Reys that these people were engaged in a criminal conspiracy to obtain possession of herself and her money. He had learnt enough to prove that Henry Gunning was a party to the plot. Hadn't he boasted of a sweetheart who was to provide him with a fortune, when thought to be ignorant of the fact that that old sweetheart was on her way to Sicamous? He had learnt enough to remove his own scruples concerning Henry Gunning. The fellow was, indeed, a bad hat. And if he had learnt that the gang which this mountainous Mr Neuburg controlled was bigger than he first imagined—this Joe, and Siwash Mike, and Joe's wife, had, at least, been added to its strength—and that that gang was dangerous, he felt that he could discount the extra strength, because of the damning force of the facts he now held in his hands.

Yes, the facts were his, the case was his. He only had to see and talk with Heloise—only had to act.

Standing in the centre of his room, a very alert figure of a young and vigorous man, he looked extremely capable of doing what he had decided to do—that is, to act swiftly and boldly. With all the trumps in his hands, there was now no need for finesse.

Heloise was in her room. Should he go to her boldly? He did not mind doing that. He did not even mind the Gorgon companion overhearing what he had to say. But—no; he must have a complete and uninterrupted ten minutes with Heloise. He would have to break down her aloofness; he would have to tell her the whole story clearly and convincingly, so that she should grasp its unmistakable import. He did not mind Méduse Smythe overhearing all he had to say; but if she were there, there would be a scene, denials, counter-charges, distractions. Heloise would only get hold of the matter in a patchy and inconclusive fashion, perhaps.

No; he had better try to see her alone, arrange a private meeting. If the worst came to the worst, he would speak out before the gang; but, until that happened, he must try his best to do the thing neatly.

But how? How fix up that private talk with her? As he thought this his eye fell on his telephone. Every room was connected by telephone. Why not get on to room 359? Heloise was in it at this moment; he could arrange a meeting under the very nose of the companion. He moved a step towards the instrument. No, that would not do. Méduse might answer the ring and put him off in some way—persuade Heloise to put him off, even. If Heloise answered—well, she, too, had him at her mercy. In her present hostile mood she might do anything; refuse a meeting, cut him off, perhaps, in the middle of his request. He durst not stake so much on the telephone.

He must depend on chance. And perhaps he would help chance along. He meant to handle this matter firmly.

Clement looked at his wrist-watch. It was very near lunch-time. And then it occurred to him that not only did he want lunch himself, but Heloise would want it also. He smiled suddenly, turned his back on the telephone, and went out of his room. He went down to the first floor, where the great dining-room was, and sat in a modest seat in the lounge. From there, without being seen himself, he could watch everybody who came up or down the stairs or along the gallery to the dining-room.

He had about twenty minutes to wait. Probably Heloise was telling the innocent Méduse that there had been a letter from her Sicamous agent at the Poste Restante, and that they had perhaps to stay a few days more in Quebec, and the reason why. Convincing the supremely innocent Méduse of these facts no doubt occupied the twenty minutes. But at the end of them both Heloise and her companion came down the stairs, and, without noticing Clement, went into the dining-room.

From a safe distance Clement saw the captain of the waiters lead them to a table, noticed that the room was not full, and that there were plenty of places at the end. Satisfied about this, he went downstairs.

In the lobby he selected a form, wrote on it, tore it up, wrote on another, and then, apparently, thought better of it. But whereas he threw the first into the wastepaper-basket, the second he folded rather cleverly under cover of that action, and kept it in his hand. Then, having convinced all about him that he wasn't sending a message, he waited until he saw a page go upstairs with a caller's form, went up himself, and waited at the turn of the stairs for the boy's return.

The boy returned alone, fortunately. Clement snapped him up.

'Want to earn a dollar?' he asked.

'Bettcher life,' said young Canada.

'Take this call-form to Miss Méduse Smythe. She and another lady are sitting at the fifth table for two on the window side. Call her name, please, but that's where she is. Give the form to her, and come away quick.'

'Yep,' said the page, grinning.

'And you don't know where it came from to anybody—even the lady herself.'

'I gottcher,' said the page, grinning more expansively. He took the dollar and the call-form. He went upstairs. Clement went after him. The page went into the dining-room. Clement stepped back quietly and swiftly into a deep passage where the male diners deposited their coats. He heard the boy calling out, 'Miss Smidt—Miss Medoose Smidt.'

In seventy-five seconds Miss Méduse Smythe came by the end of the coat-passage at a great pace. Clement had thought she would be swift. What he had written on the call-form, in anybody's handwriting, was: 'Must see you for ten minutes. At once.—Joe.'

The companion might have argued about that handwriting, but how was she to know that 'Joe' did not have to disguise it? Clement had banked on that idea. And he had scored.

Miss Méduse Smythe was no sooner out of vision than he was in the dining-room, alongside Heloise's table, speaking to Heloise. 'Miss Reys,' he said, 'will you give me an opportunity to talk—to talk to you privately?'

'Mr Seadon!'

Heloise's tone was affronted, cold. Obviously she resented his speaking to her; but obviously, too, the extreme publicity of the place robbed her attitude of some of its effectiveness. It is to be feared that Clement had taken that into his calculations when he had decided on this plan.

'Miss Reys,' he said, 'I want to speak to you—privately—for no more than ten minutes. And I want you to understand that it is only the urgency of the matter that makes me force myself upon you.'

She hesitated, looking up at him, her vivid face showing the keenness of her emotions. As she hesitated, 'Do you remember saying that you believed I'd be honest even against my own interests?' he asked.

'Yes,' she said. 'I did say that, but'——

'I am honest now. Will you believe that?'

The girl looked at him quietly for a moment. 'I believe that,' she said.

'And will you give me that chance of speaking to you—alone?'

The girl bent her eyes to the table. She was thinking quickly. 'To-morrow morning I shall be in the writing-room at half-past nine. Will that do? It will not be easy to manage it before then.'

'It will do admirably. Thank you,' said Clement.

He left her, and went to the back of the room, where there were a number of empty tables.

As he sat and ate his lunch the companion Méduse came in. She was flustered; she was even scared. Clement was amused, but he did not think it mattered very much. She would not, he thought, mention the reason for her having left Heloise—though actually there was no reason. Neither did he think that Heloise would tell her of the appointment she had made. His insistence upon privacy, the way he had snatched at the chance to speak to her alone at her table, the way he had left her, would all tell Heloise that the companion Méduse was excluded from the secret.

And even if she did tell, it would matter very little. Clement would have his interview with Heloise no later than the next morning, for Heloise would see to it that it happened, and nothing very much could occur until that time. The rogues could not whisk her away against her will. They had to move delicately always.

And after he had spoken to Heloise nothing

at all could occur. He would have settled with Mr Neuburg and his gang once and for all.

He finished his lunch after the two ladies, watched them retire from the dining-room, then he got his hat and stick, and walked out to explore Quebec. He would take a look at this glue-merchant's in the Sault Algonquin. It was best to be well-up in every particular. Very cheerfully he walked through the Place d'Armes, and down the steep street of The Mountain to the huddled network of passageways—they can hardly be called roads—that crowded under the rocky scarp of the Grand Battery. He was feeling 'good,' as the Canadians would say. Why not? Hadn't he all the factors for victory surely in his grasp?

Possibly he would have felt less 'good' if he had been aware of a little scene between the companion Méduse and the massive Mr Neuburg that was even then taking place in the great hotel he had just left.

(*Continued on page 186.*)

SOME 'JOCULAR' TENURES.

By CHARLES G. HARPER.

I.

IN feudal times, when personal service counted far more than money, rents were paid chiefly in kind or by duties performed, and grants of land were made by the sovereign and the great barons and other dignitaries to persons in consideration of their performing annual service, generally styled 'customary rent' or 'quit-rent.' Technically, all land is held ultimately from the king, although 'fee-simple' is actually absolute ownership and equivalent to 'freehold.' It is the most plenary form of ownership known to the law. The ancient tenure of land from the king and the great nobles was by grand serjeanty or by petit serjeanty—the performance of services in war or peace of some moment, such as serving in person or providing men and munitions; or rendering minor and not infrequently absurd or farcical duties, known to antiquaries as jocular tenures.

What has been described as 'the greatest and most honourable service' in grand serjeanty ever granted to a subject was that by which the county and earldom of Chester were held. William the Conqueror gave the whole of Cheshire to Hugh Lupus, son of the Viscount of Avranches, and the Conqueror's own nephew, to him and his heirs, to hold as freely by the sword as the Conqueror held the crown of England. This recalls the action of John, Earl of Warenne and Surrey, in the reign of Edward I. Under the statute of *Quo Warranto?* the earl was required, in 1278, to declare by what warrant or title he held the two hundred lordships that were his and his ancestors' before him. When the commissioners asked him his right, he answered, drawing his sword—and the sword was then a very real weapon, not the mere symbol which modern artillery and firearms have degraded it to be—'Behold! my lords, here is my warrant. My ancestors, coming into this land with William the Bastard, did obtain these lands by the sword, and I am resolved by the sword to defend them against whomsoever shall endeavour to dispossess me.'

The tenure of the manor of Scrivelsby, in Lincolnshire, was perhaps the most picturesque of all these ceremonies and observances. It was the duty of the lord of Scrivelsby to act as 'King's Champion' at the coronation of the sovereign. This was described at length in *Chambers's Journal* for February 1911, and thus there is no need to cover the ground again; but, briefly, the office of 'King's Champion,' associated with the holding of Scrivelsby, dates from the time of William the Conqueror, who granted to Robert de Marmion that manor, together with the town and castle of Tamworth. The Marmions came from Fontenaye, in Normandy, and were for centuries a proud and knightly race. Sir Walter Scott has picturesquely dealt with them; but they seem to have originated in very lowly fashion, for the name is said to derive from 'marmiton,' a worker among the saucepans in the scullery.

The Marmions gave place at Scrivelsby, in 1292, to the Ludlows, one of whom, we read, married a daughter of Philip Marmion; and again by marriage the estates passed to Sir John Dymoke, and the service, privilege, or obligation of performing the office of 'King's Champion' fell by consequence to him and his heirs. This was to ride, fully armed, on an armoured horse, into Westminster Hall in the presence of the king, and to throw down a gauntlet and in a loud voice to challenge 'any person of what degree soever, high or low, who shall deny or gainsay' the right of the sovereign's succession to the throne. This challenge having been uttered three times, the custom was for the king to drink to the champion out of a gold cup with a cover, and then to present it to him by the hand of the Earl Marshal. The champion then drank off the wine, performing three reverences, and withdrew with the cup, which became his perquisite, together with the horse and the armour, which he had obtained from the king's stables and armoury.

The Dymoke family, still in possession of Scrivelsby, have been 'King's Champions' for more than five hundred and sixty years. The

custom was maintained with great splendour at the coronation of George IV., but discontinued at the coronations of Queen Victoria, Edward VII., and George V. The Dymokes long retained in their possession the perquisites of their service; but Sir Henry, the seventeenth 'King's Champion' of his line, who died in 1865, bequeathed to Queen Victoria his cups—some gold, and others silver-gilt. She returned them to his successor, his brother, John Dymoke. The suits of armour were, however, sold.

II.

For upwards of seven centuries the Corporation of the City of London has paid curious quit-rents to the king in respect of land in the parish of St Clement Danes, and at More (sometimes called 'The Moors'), in Shropshire. Brief reference to these was made in an article entitled 'Housing Schemes of Another Kind,' which appeared in the February part of *Chambers's Journal*. Here we may be allowed to deal with them in greater detail. The ceremony takes place annually in the Royal Courts of Justice, where, on a day in October, the City Solicitor attends to perform suit and service before the King's Remembrancer. This act formerly took place before the barons in the Court of Exchequer, in the presence of the Lord Mayor and Sheriffs; the present procedure was instituted in 1845. In those old days also the King's Remembrancer was present. He sat with the barons, and enjoyed the right (for whatever that was worth) of wearing his hat in court. This privilege is kept alive by his wearing a little hat on the top of his wig on Lord Mayor's Day.

The first service, of the payment of six horse-shoes and sixty-one nails, originated in the reign of Henry III., and arose from the possession of the olden tilting-ground of the Knights Templar, which was situated partly in the Inner Temple and partly in St Clement Danes parish. By tradition, an itinerant farrier established himself in a little shed close by, that he might be at hand to reshoe the horses whose shoes had become dislodged in the tilts, and to repair the battered armour of the combatant knights. The king, greatly interested in the farrier's dexterity, gave him for the purpose of his craft a piece of land in the parish of St Clement Danes, upon rendering the annual quit-rent of six horse-shoes and sixty-one nails. The exact site of this holding has long been lost, but the tribute continues. The horse-shoes produced are of great size and strength, for the horses ridden in tilts and tournaments were not such as those usually pictured by romantic illustrators, but great Flemish steeds, more nearly resembling the modern cart-horse. It is said also that they were trained to strike with the forefeet; and it is a curious fact that the shoes annually produced, believed to be the identical shoes offered for the last five hundred years, are all forefeet shoes. They are kept in the office of the King's Remembrancer.

The other service, for lands at More, in Salop, is the production and chopping of two bundles of faggots. The City Solicitor appears in court, and places two miniature bundles, about the size of a sheaf of spills, on a block upon the solicitors' table, and producing, according to the terms of the tenure, 'two knives, one good and the other a very bad one,' cuts one bundle of faggots through with a knife, and the other with a bill-hook. The King's Remembrancer, having counted the horse-shoes and the sixty-one nails, and finding them a correct tally, declares them to be a 'goodly number.' He accepts them, the knives, and the hatchet or bill-hook on behalf of His Majesty the King, and the ceremony concludes.

In solemn official fashion the Courts Leet of the three manors of the ancient Borough of Southwark still meet annually to transact business, on a day in October, although their ancient jurisdiction in these days of modern municipal authorities has been reduced to the exercise of only some very shadowy functions. It was in the reign of Henry III. that the citizens of London were given the lordship of the manors in Southwark: the King's Manor, the Great Liberty Manor, and the Great Guildable Manor. To this day the City Corporation remains lord of these, and the City Recorder, acting as High Steward, presides over the annual Courts Leet. The meeting-place of the first is generally the Mission Hall in the narrow purlieu of Collier's Rents. Here the jury sit round a table, faced by the Recorder and the City Secondary, who is present as High Bailiff and Prothonotary, or clerk. The foreman of the jury is duly sworn, in archaic language. The Riot Act is read, and a call is made for any one to reveal any treasons or felonies within his knowledge. No one has ever been heard to make any such revelations, and none will, probably, ever be made. The High Bailiff, addressing the jury, assumes that they reserve to themselves the right of appointing an ale-conner and a flesh-taster, to which the foreman of the jury solemnly agrees, although the functions of those officers have long since been merged in the duties of modern borough officials. A like procedure is followed in the case of the other Courts Leet. The rights thus reserved of ale-conning and flesh-tasting, when such articles are exposed for sale, do not ever appear to be exercised, but they would seem still to be legal, if it were desired to do so.

III.

The manor of Shrivenham, in Berkshire, was held from the king by the whimsical service of meeting him whenever he should pass Fowyeares Mill Bridge, and bringing two white capons, and holding them up before him and exclaiming, 'Here, my lord, are two fine capons, which you

shall have some other time, but not now!' With this tantalising procedure, always repeated, the king never got his capons. In Northamptonshire there is a place called Ashby Meares, where there used to be a parcel of land consisting of thirty-six acres of arable land and six acres of woods, with one pigeon-house, held by the quaint petit serjeanty of holding up the right hand on Christmas Day towards the king, 'whenever he shall be in England,' and presumably when he passed that way.

Chess has, equally with golf, been declared the 'royal' game. The manor of Kingston Russell, in Dorsetshire, or at any rate lands there, used formerly to be held by the counting-out of the chessmen in the king's chamber, and putting them in a bag when the sovereign should happen to play chess with the holder—perhaps rather a remote contingency. Bures, a place situated on both sides of the river Stour, and thus partly in Essex and partly in Suffolk, was a property retained by a less fantastic service. It was that of scalding the king's hogs—a performance less objectionable than that demanded of the tenant of lands at Shirfield, Hampshire, who, among other thankless performances, was expected to see to the dismembering of condemned malefactors. To the measuring of the gallons and the bushels in the king's household, which was another part of his duties, there could not be much objection.

A custom connected with a royal manor is still maintained in the Isle of Portland, where the Reeve Court is held twice yearly, in May and November, at the George Hotel, Portland, to receive the rents due from the tenants of the king's manor. These used always to amount to fourteen pounds fourteen shillings and threepence, of which sum one pound is returned to the reeve, who attends with the Portland reeve staff. The sum now paid by the tenants is somewhat larger, due not so much to increased rents as to the number of houses being greater than formerly. It comes now to about twenty-six pounds. The reeve staff, kept at the 'George,' is in the nature of a wand of office. Several curious customs connected with the renting of Crown lands may be found in different parts of the country, still scrupulously observed, as in the case of the 'King's Rent Hole' custom, on the wild hillsides near Llanbister, in the region of Llandrindod Wells. There, on a day in January, the farmers and others assemble and stand in a hole, offering rents for the ensuing year for certain lands, and standing surety for each other in payment. Each bidder advances along a shallow trench and stands in the hole, generally in the presence of curious spectators.

IV.

Lands held from the Church, from great peers, or from other personages were subject to as unusual services of tenure as those held from the king, but they may be said to have nearly all been services of petit serjeanty. Property at Fulmer, in Buckinghamshire, entailed the rendering of one rose yearly. We have often heard the expression, a 'peppercorn rent,' which is a conventional phrase for a very low one, but such a rent is actually paid in one instance. Mr Staveley-Hill was recorded to have received, on 20th December 1912, a peppercorn in a white envelope, the rent of the old village school at Bushbury, Wolverhampton, on the occasion of his visiting the school. He then stated that he believed himself to be at that time the only person in England who was actually paid a peppercorn yearly. By enclosing it in an envelope the tenant greatly exceeded the terms of his obligations.

A remarkable manorial custom once observed annually at Attleborough has long been extinct. This was the Warepound or Frowick Court, popularly known as the 'Scolding Court,' held on Whitsunday morning before sunrise. The business of the court concluded before daybreak, under the penalty of the manorial rents being forfeited for the year. A similar and very ancient gathering, extinct since about 1888, was the 'Whispering' or 'Lawless Court' of Rochford, in Essex. On the Wednesday after Michaelmas Day, at midnight, the steward and tenants of the manor assembled in the open air. The steward, taking his seat at a table, fixed his attention upon an open book spread there, containing a record of the tenants and their holdings. Not a word was spoken louder than a whisper, and a piece of charcoal was used to record the proceedings. No light was suffered save that afforded by moon or stars, and the greatest solemnity characterised the proceedings. Any tenant coming late was mercilessly fined, while the absentees lost their holdings, without hope of redress. The site of this ancient court is now marked by the 'Whispering Post,' round which the tenants were accustomed to pay their dues. It is a white-painted post with a spear-like head, set up in an enclosure in front of a cottage on the Stambridge road.

At Langsett, near Penistone, in Yorkshire, the service under which land was held was the production of a snowball at midsummer and a red rose on Christmas Day. The rose may easily have been forthcoming, for nothing was said as to it being necessary to bring a fresh one; but the presentation of a snowball looks like an impossible condition, although Blount, who in the seventeenth century wrote a book on tenures, declared that in the caves and on the high hills of Yorkshire snow in June was not uncommon. He further adds that these tenures never prescribed impossible performances. Here, however, we are bound to disagree. Those occasions when enough snow was to be found in Yorkshire at midsummer wherewith to make snowballs must have been few, and not more frequent in

olden times than now. In fact, they must surely ever have been sufficiently rare to form a phenomenon. We are compelled to think that some wag of centuries ago purposely transposed the occasions of rendering the rose and the snowball; or, alternatively, that as we learn the land was redeemable by a pecuniary payment, in default of those offerings to the Bosville family, the overlords, the jocular tenure was never actually intended to be fulfilled.

A very elaborate ceremony was formerly associated with the estate of Brindwoods, at Chingford Hatch, Essex. When it changed ownership, the new owner, his wife, his manservant, and his maid, each singly, on a horse, presented himself or herself at the rectory, where the owner performed his homage and paid his relief, blowing three blasts with a horn and carrying a hawk on his wrist. His servant was accompanied by a greyhound on a leash. Both hawk and greyhound were supposed to be for the use of the rector that day, and for the feeding of them the rector was bound to supply a chicken for the hawk and a loaf of bread for the greyhound. The rector entertained the company at dinner, and afterwards the new owner of Brindwoods departed, with wife and servants, blowing three farewell blasts on his horn. The last recorded instance of this custom appears to have been in 1659.

V.

But not all these old-world observances have fallen into disuse. Every year the 'Rhyne Toll' of Chetwode, in Buckinghamshire, is paid, as it has been from time immemorial. 'Time immemorial,' it may be incidentally remarked, has a limitation. To laymen it means merely 'beyond the memory of man.' To lawyers it means a period before the reign of Richard II. The 'Rhyne Toll' is in force between the morning of 30th October and midnight of 7th November. In that time the lord of the manor of Chetwode may by that ancient custom claim a toll of two shillings a score on all swine and cattle driven through the six or seven hamlets from which suit and service are due to him. A sum of between twelve pounds and fifteen pounds generally accrues to him during this annual week. The generally received origin of this manorial custom is the killing in olden times by the lord of Chetwode of a savage wild boar which once troubled the neighbourhood. This tradition was apparently confirmed in 1810, when the bones of an enormous boar were found in the adjacent parish of Barton Hartshorn, buried in a mound. Farmers and others liable to this toll generally compound for it by payment of a small sum annually. Occasionally the toll has been resisted, but it has been found legal.

At Godolphin House, in Cornwall, not far from Helston, an odd manorial custom is still held annually on the morning of Candlemas Day, 2nd February. The ancient manor-house of Godolphin, a property of the Duke of Leeds, head of the Godolphin-Osborne family, is now a farmhouse. In ancient times this was an appendage of the manor of Lamburne, held by the Arundells, by marriage with a daughter of Sir John Lamburne of Lamburne. The sale to the ancestors of the Godolphins was accompanied by the remarkable condition that once a year for ever the reeve of the manor of Lamburne shall come to Godolphin, and there boldly enter the hall, jump upon the table or table-board, and stamp or bounce with his feet or club to alarm and give notice to the people of his approach, and then and there make proclamation aloud, three times, 'Oyez! oyez! oyez! I am the reeve of Lamburne, come here to demand the old rent, duties, and customs due from the lords of the said manor of Godolphin.' Whereupon eight groats and one penny, a sixpenny loaf, a cheese worth sixpence, a collar of brawn, and a jack of the best beer in the house are brought. Having received and drunk of the beer, tasted of the cheese and the brawn, the reeve departed, carrying with him the rents of eight groats and a penny and the remainder of the viands.

This observance is now carried out with some slight variations by the reeve of Clowance, a property of the St Aubyns, who, knocking thrice upon the oak endoor, declares, 'I come to demand my lord's just dues.' Being admitted, he jumps upon the table, and, as prescribed, performs the ceremony. Nowadays there is usually an assemblage of some forty visitors, eager to see this old custom, and all partake together of breakfast.

The strange 'gad-whip' custom of Caistor church, Lincolnshire, said to have been last regularly observed on Palm Sunday, 1845, but certainly revived on that day in 1885, was a manorial service by which the olden squires of Broughton held land under the lord of the manor of Hundon. Every Palm Sunday, during morning service, a person from Broughton parish entered the porch of Caistor church, carrying an enormous whip with a white leather thong ten feet in length, which he then proceeded to crack thrice outside the porch at the beginning of the First Lesson. Then, retiring until the beginning of the Second Lesson, he returned, having meanwhile fastened to the end of the lash a purse of green silk with four twigs of wych-elm of different lengths. The purse contained a tribute of thirty silver pennies. The whip-bearer then walked slowly into the church, knelt before the clergyman, and waved the thong thrice over the incumbent's head as he stood at the reading-desk. He remained holding the whip in that position until the ending of the Second Lesson; he then rose, and taking the whip to the pew appropriated to the holder of Hundon manor, left it there. The varying lengths of wych-elm

were said to typify the writings of the Four Evangelists, the silver pennies to represent the price of Judas's treason, the three cracks of the whip the thrice-repeated denial by St Peter of his Lord, and the waving of the whip over the head of the minister to represent homage to the Trinity. This fantastic service is said to have come down from Saxon times, and legend has found a picturesque origin for it which, in view of the other strange customs already recounted, we may fairly be entitled to look upon as mere invention. By this account it would seem that ages ago, in that indeterminate period known in fairy-lore as Once Upon a Time, the holder of the Broughton lands under the lord of the manor of Hundon was a hard and cruel man. Having caught a boy trespassing, he beat him so severely with a spar or a gad that he died. As time went on remorse preyed upon him; he made confession of what he had done, and the penance of performing the ceremony described above was prescribed for him and his heirs and successors on the land for ever. It is an excellent attempt on the part of the rustic community to find a reason for what to them is inexplicable, but it does not commend itself to the antiquary.

THE FLINT DEATH.

PART II.

V.

AS I descended the slope to the village I pulled myself together, and for the first time since the tragic happening of the night before made an attempt to penetrate, by the aid of cold reason, the obscurity which veiled its origin. But I groped, I floundered, among nebulous surmises and bogs of conjecture. The previous night theory, mocking and unsubstantial, had come unsought. Now I pursued it. I felt that the limits of my inquiry must be bounded by circumstances narrow and inevitable. The man who had fashioned the dart that killed Brierly Stretton was certainly no tyro in knowledge of the science of Prehistory. In vain I recalled the names and characters of its experts in an attempt at his identification. Those who could have produced a pattern so true to type were few indeed, and eminently above suspicion. But had the hand that made the arrow also sped it towards its mark? The aim had been unerring, and afforded proof of skill and long practice. It seemed to me that the resolve which had overcome the difficulties attendant upon the use of a weapon so primitive must have arisen in a mind of a firm and superior kind, a mind capable of creating as well as launching the instrument of its vengeance.

Vengeance! Ay, what other motive could have influenced such an act? Vengeance, subtle, if distorted, possessing a firm belief in the poetic justice of the blow that it had struck.

The whirring of a motor in the near distance made a welcome break in the grim train of argument which had held me. It was the Thorndean car on its way to the station to bring Barrasford back to the house, and hailing it, I jumped inside, and arrived at the junction as the London train steamed in.

Stephen Barrasford, whom I had met at his uncle's house in town, was the type of young man who at twenty-eight assumes the pose and responsibilities of a time of life from which, in ordinary circumstances, he would have been immune for another fifteen years. His sombre, critical eyes bulged upon the world like the magnifying-glass of a watchmaker over refractory working parts, and he carried a weary burden of common-sense. His occupation as a rising accountant had given him a manner of habitual opposition which had served him well in his profession, and had made him most unpopular at his club. As he descended from the train in meticulous mourning, I became wretchedly aware of the immediate dissatisfaction with which he would listen to my story.

We got into the car after a rather perfunctory greeting. I mumbled something consolatory.

'But I don't understand,' he said, glooming. 'Let us begin at the beginning, Mercer.'

As plainly as I could I told him how matters stood.

'That is scarcely how the papers treat the matter,' he said in his querulous monotone. 'It was surely a mistake to provide them with such full details. Have the police come to any decision as yet?'

'We are all absolutely in the dark,' I assured him.

'Of course, I don't profess to be able to give an opinion,' he said, 'but I take it that a preposterous practical joke has ended in a tragedy.'

'A practical joke!' I cried. 'Good Lord, man, it was practical enough, in all conscience! Surely you don't think'——

His unwinking gaze was heavy upon me. I felt myself flushing, and sputtered witless attempts at explanation.

'We shall act unwisely if we make a mystery of the matter,' he said portentously. 'So far as I understand it, this arrow-head thing was the work of some one who has made a—a hobby of this antiquity nonsense—some unmitigated ass who thought it an excellent joke to startle my

uncle with the kind of weapon in which he was interested, and never thought that his folly would end in grim earnest.'

'If that arrow wasn't shot to kill,' I said, looking him straight in the eyes, 'common reason has been denied me.'

He made no answer, but frowned at the chauffeur's back, and for the rest of the drive maintained a brooding silence. But I could feel his protests boiling beside me.

VI.

As we drove up to the front-door I saw Relf standing upon the steps, evidently in an agony of apprehension. 'Mr Mercer! Mr Mercer, sir!' he called out ere the car came to a standstill. 'Lady Stretton—she is not to be found!'

I stared at him stupidly.

Barrasford pushed past me. 'What do you mean, Relf?' he asked. 'How not to be found? Don't talk nonsense.'

'She's not in the house or the grounds, sir,' faltered the butler. 'Inspector Greave has been searching high and low for her. There's not a sign of her anywhere.'

Inspector Greave hurried up, his bearded mouth working in voluble explanation while he was yet thirty yards away. 'It's just as he says, gentlemen,' he assured us. 'Her ladyship's been missing for the last hour and a half, perhaps longer. Her maid left her to go to lunch, and when she returned Lady Stretton had disappeared.'

'Disappeared,' sneered Barrasford. 'Good gracious, man! one can't "disappear" in a place like this.'

'Look here, Barrasford,' I said testily; 'I'm sorry, but your intolerance is misplaced. Some fact of a most serious kind underlies all this, take my word for it.'

'Rubbish!' he said contemptuously. 'You're excited, Mercer.'

I ignored him and turned to Inspector Greave. 'What do you make of this?' I asked, drawing the piece of fox-skin from my pocket. 'I found it jammed in the side-door this afternoon.'

He took it and fumbled it between his thick, maladroit fingers.

'Have you by any chance examined the caves?' I asked.

The inspector smiled leniently. 'That would be a big job, sir,' he said. 'There's between thirty and forty of them. I didn't search them for the same reason that I didn't search every house in the village.'

'And that is?'

'Because it's not a likely spot.'

'For a man who shoots—er—such things to be found, eh?'

'I agree with the inspector,' said Barrasford. 'We're not living a detective story, Mercer.'

'It's not the probability of the thing only,' I urged. 'It's something else—something intangible, if you like; but it sticks. I was on the moor this morning. I felt—— Come, inspector, shall we go?'

'But Lady Stretton, sir.'

'The caves come first, I think,' I insisted. 'I'm trusting to instinct. Come along, both of you.'

Barrasford's mouth opened in protest, but I bundled him into the car, and told the chauffeur to make for the road beneath the cliffs. In a few minutes we had passed the encircling firwoods. We climbed to the narrow platform which shelved in front of the caverns, a bare ledge not much broader than a dining-room table, and here Barrasford, an incongruous figure in silk hat and black overcoat, turned and regarded me wrathfully. 'Look here, Mercer,' he said volcanically, 'I must protest'——

'Let's get on,' I snapped. 'This isn't a board meeting.'

'It isn't a field club,' he retorted. 'Commonsense'——

'Confound your common-sense!' I roared. 'You're one of the kind who live upon likelihood. D'ye think I'm cooking a mystery for your especial satisfaction?'

'Have your own way,' he mumbled in graceless resignation; 'though what you're driving at I haven't a fraction of an idea.'

'I never accused you of having,' I said maliciously.

VII.

'How must we proceed, sir?' asked Inspector Greave, who had been peering into the shadows of the cave directly behind us. 'You know the lie of the land far better than I do.'

'I want you to remain here,' I told him. 'This is the only way down to the level. Let no one pass you, whoever it may be. Mr Barrasford and I are going to explore the caves—every one of them, if necessary.'

We entered the first cave, and Barrasford, striking a match, held it near the low roof. It was quite empty, but as the light died out I noticed the marks of Stretton's excavations in the upturned soil.

'Satisfied?' asked Barrasford tartly.

'No,' I said sturdily. 'Next cave.'

'Oh, hang!' he ejaculated, and stamped viciously on the match-end.

Three caverns in succession we explored. Then it was that Inspector Greave showed signs of restiveness. 'Excuse me, sir,' he cried from his post of vantage, 'but it seems to me that we're wasting valuable time. There must be well-nigh thirty of these caves. Do you propose to examine them all?'

'Every one of them,' I replied casually, for a sparkling something lying on the narrow shelving had arrested my attention.

'Found anything?' asked Barrasford sarcastically.

'Nothing that you would place any value upon,' I replied with triumphant rudeness.

Almost at my feet lay a little heap of fragments of chipped stone, the leavings of the flint-knapper. I bent down and routed amongst it with eager fingers. Behind me was the cavern which Stretton had made world-famous as 'Hammer Hole,' so called because in its floor he had found a polished tool of superior workmanship.

'I'm going in there, Barrasford,' I said. 'You must stand at the entrance. If you hear me call, come after me.'

I left him frowning beneath the rim of his silk hat. How badly he matched the surroundings! I thought, as I plunged into the deep throat of the cavern. Hammer Hole was by far the largest and deepest of the Thorndean caves I knew. There was a sharp elbow of passage leading to a bottle-shaped chamber, which again sloped downwards to a long, narrow recess in the heart of the cliff. I slipped off my boots and felt my way cautiously through the narrow corridor of rock, until I emerged into comparative spaciousness. Then I halted. I could hear the dismal drip, drip of water, but so dense was the darkness that I could see nothing except my own hands, which looked like white shadows. Then I heard the sobbing of a woman.

At the sound some blind and rugged instinct awoke in me. I called upon Bianca as man had called to woman in that place of early security a hundred centuries before me.

'I am coming,' I shouted; 'I am coming.' My voice rang through the rocky darkness in vehement and masculine assurance of aid. The sinews corded under my tweeds in tense preparation for struggle. Then the gloom before me seemed to grow solid, a great body bore down upon me, and I was circled by ferocious arms. I grappled with something hirsute, gigantically thewed, something that smelt of the den and snarled as it mouthed my shoulder. I met it with a frenzy of elemental rage like its own. We dashed from wall to wall; then I wrenched a hand free and struck murderously. The gnawing teeth left my shoulder, I was hurled aside, and I knew that my antagonist was making for the entrance. I clutched at a dangle of furs which brushed against my hands as he strained for the cave-mouth. Through the passage we hurtled in a wild exchange of buffetings, his two hands to my one—and then light broke upon us, and I saw his face.

'Bentley!' I cried. 'You!'

He drove at my eyes and broke away. At the entrance stood Barrasford, respectably irresolute. In a bound my man was on him. For a moment black overcoat and furs were mingled in droll anachronism. The inspector shuffled up. I had a glimpse of giant limbs strained in titanic effort. Then, with a yell in which both defeat and triumph seemed to blend, the cave-man shook himself free and leapt to the death that it was best he should find, among the shadows of the black firs far below.

VIII.

Harsh things have been spoken of Bianca, my wife, and it is to silence the voice of malice that I have written this account of the doings at Thorndean in the September of 1912. I must also do tardy justice to another, Philip Bentley, once Stretton's valued assistant-curator, and later his unhappy victim, who, among students of Prehistoric Archæology, was regarded as standing upon the threshold of a career of extraordinary promise. Stretton had observed Bianca's marked preference for the younger man, and when he learned of their engagement, the callous and unbridled egotism which dictated his every action had urged him to effect Bentley's ruin. He trumped up a dastardly charge against his assistant of the theft of valuable specimens from the great museum with which both were connected. The evidence against the unfortunate young man seemed positive and irrefragable, and he was sentenced to a year's imprisonment.

No sooner had Bentley been removed from his path than Stretton redoubled his attentions to Bianca, with whom he was as infatuated as it was possible for a man of his cynical nature to be. Bianca's parents were needy, and her mother was a bedridden invalid, slowly dying from the want of care which neither husband nor daughter could render because of their daily tasks. Stretton had come to their aid, and seized the opportunity to ingratiate himself with the old people. In this he wholly succeeded, and at the urgent entreaty of her grateful parents, Bianca consented to sacrifice herself. She was aware that on leaving prison Bentley's mind had given way, and therefore she believed that he had passed out of her life.

She had not been many weeks at Thorndean as Stretton's wife when she made a startling discovery. In a cupboard in the room in which Stretton's private collection was housed she found the specimens which her husband had accused Bentley of purloining. Stretton had evidently shrunk from destroying them, and she had challenged him regarding their presence in the house. But he utterly denied that they were the missing exhibits, and the cold fury he showed at the mere suggestion frightened her into silence.

One evening, as she was walking in a distant part of the grounds, she was suddenly accosted by Bentley, who had escaped from his place of confinement. He reproached her bitterly, and told her that, as he had found no justice in the modern world, he was resolved to adopt the life and manners of that primeval world on which

he had pondered so deeply, and where, as he said, justice was to be obtained by virtue of the strong hand alone. He refused her offers of assistance, and left her, vowing a terrible vengeance against Stretton. He had told her that he was sheltering in the Hammer Hole; and when she realised by what means Stretton had been killed, knowing of her former lover's plight, and almost demented, she had conceived it her duty to try to save him. With this intention she had gone to his place of concealment, and when I came upon them she was vainly urging him to save himself by flight. But the mania that he was in reality a man from a past age had grown upon him, and now possessed him wholly, and he had met her entreaties with savage refusal.

In a recess of that grim dwelling of the Stone Age men we discovered the entire flint armoury of Philip Bentley, along with his fire-drills and flaking-tools, and the bundle of pelts which he had dressed for clothing, as well as the simple domestic contrivances he had used—all providing eloquent testimony of the accurate knowledge which his poor, mad brain still held of that science of which he was such a brilliant but unfortunate exponent.

THE END.

PRUNES.

By A. H. WARE.

THERE is one place in which the prune is not disdained, and where to be called a 'prune' is not a condemnation. In the counties of central California the prune is king. The Santa Clara valley is the best spot in the world to study prune-growing, as most of the world-supply comes from there. Let us go there for a moment and learn a little about this favourite army-and-boarding-house luxury.

In the first place, we learn that prunes are not grown from their own seed, but are grafted on to apricot or almond trees. The pits of the apricot and almonds are sprouted in nurseries, and are allowed to grow for two years. In December of the second year scions are cut from one-year-old prune wood, and, trimmed of leaves, are placed in dry sand, where they stand unwatered until February. Then they are grafted on to the almond and the apricot stalks in the following way. The shoots are cut down to the ground and split, the scion then being introduced into the split end, and the joints well gummed. For a year they are permitted to grow, attaining at the end of that time a height of about four feet. It is now that the ranchers buy the trees, and transplant them into the orchards, cutting them down to two feet, and placing them in rows about twenty feet apart.

A rancher must now possess his soul in patience, for the wood must be four years old before it bears, and the fruit-buds appear a full year before ripening. During this time many disasters may happen, such as frosts or fire. But there are many compensations for these worries. Prune-orchards do not need irrigating. This is an important fact, for water is expensive, and many a dry-farmer of other crops spends his income in providing his land with the necessary moisture. The cultivating of the orchard begins in March. Then the ground is ploughed. It is harrowed and weeded until the 1st of June, after which nothing is done until the harvest is over.

April in the Santa Clara valley is unspeakably beautiful. Standing on the hills that frame it, one looks across miles of white blossoms—banks of snow where the ground rises, and stretches of white in the plain, where one can almost believe he is looking over the Arctic snowfields. There is no other colour in the valley, except for a few peach-orchards, where the pink is as delicate as the sunrise on snow. This is the gala-time of bees and humming-birds. In its beauty alone, the rancher almost feels repaid for his trouble.

The foliage appears upon the falling of the petals. From this time until the fall there is not one drop of rain in all this region. About the middle of August the fruit ripens. It is incredible how much a single tree bears. One sees ranch after ranch where the trees are propped up to keep from breaking under the weight of fruit which grows in clusters all over the branches, sometimes reaching five hundred pounds on one tree.

Prunes are not picked, but are allowed to drop off the tree. My sleeping-porch is surrounded by fruit-trees, and during the weeks when the fruit falls I lie awake and listen to the thump—thump—swish—thump of the prunes as they drop to the ground. The smoothly scraped surfaces of the orchards are blue with prunes. The careful rancher does not shake his trees, for the longer the fruit stays on the boughs the sweeter it gets, and the heavier.

September is the month of prune-picking. During this month the country is full of tents and temporary shacks occupied by whole families, who come especially to gather the fruit. One sees parties of girls strolling to their work, comfortably dressed in overalls or khaki shirts and trousers, and wearing huge knee-pads. These pads are very necessary, as one kneels for hours when prune-picking. Old men, women, and little children help in this, and earn very good pay, too. A good worker gathers as much as half-a-ton of fruit a day, getting for this twelve

and a half cents per box of fifty-five pounds. A little boy may easily make from a dollar to a dollar and a half a day. The prunes are placed in boxes which stand under the trees. Each box contains about fifty-five pounds of the green fruit. By 'green' I mean undried fruit. As the boxes are filled they are taken to the driers.

The drier stands upon a platform before a vessel of boiling lye-solution. Each rancher brings his boxes and piles them up by themselves. Let us say that Smith's boxes are the first to be treated. His fruit is emptied into steel baskets and lowered into the lye-water, where it is allowed to stand a moment. The effect of the lye is to cut the skin a trifle, so that it is made more tender and easier to dry. The baskets are then lifted, and the fruit poured upon an inclined runway perforated with holes. Under this is another runway, parallel to the first, but turning at the end to the opposite side. As the prunes roll down the board it is violently shaken, causing the fruit to dance briskly all over the surface of the incline. The little prunes then drop through the holes, and proceed to roll on the underneath plank. In this way the fruit is sorted into two grades, according to size. It is a comical sight to see a prune dodging and dancing around a hole as if imploring to escape, and finally jumping into it and disappearing. At the lower end of the runway two men stand with trays upon which the fruit rolls. The men scoop it over the trays as it emerges, and spread it to dry. When a tray is filled it is taken away on a wagon, and another is put in its place. Each tray holds two boxes of prunes.

The trays are then laid in rows—all of Smith's in one place, and all of Jones's in another. For two weeks the sun cooks the fruit, turning it from purple to black. During this process the prunes shrink considerably, it taking two and a quarter pounds of the green fruit to make a pound of the dried. The riper the fruit, the less is the shrinkage.

The prunes, when dry, are dumped into bins. The drier provides each customer with a bin in his fruit-house, upon which appear the names of the owners. In these bins the fruit sweats and equalises. When this is done the ranchers cart their property away. For dipping and drying the fruit the driers charge $5·50 a ton.

The ranchers now take their prunes to the buyers, who test them, buying them by weight. The test is as follows. The buyer shoves his hand into each sack of fruit ten times, taking out ten handfuls, and noting how many prunes there are to a pound each time. An average is then struck, and the whole crop of prunes is paid for accordingly. In 1918, for instance, there existed what is known as the six-cent basis. The buyers on this basis pay six cents a pound for prunes, averaging seventy to eighty prunes to a pound, dried. For each point below this—that is, if the fruit is bigger—the rancher gets one dollar more a ton for his crop. On the other hand, for each point above this, when the fruit is smaller, he gets one dollar a ton less. So it makes a great difference whether a man's prunes average sixty-nine or seventy-one to a pound.

The prunes are now bought by packers, who prepare them for the market by washing them in boiling water and packing them. This is almost entirely done by women. They turn the empty cases upside-down with the lid on and the bottom off, and after working the biggest prunes in their fingers to make them smooth, they arrange them in even rows over the inside of the lid, generally making two rows. Upon this 'facing' the rest of the prunes are poured until they weigh enough—five, ten, twenty-five, or fifty pounds, as the case may be.

Prunes grow best in red clay land, and if well cared for the trees will bear for a lifetime. Perhaps the largest prune is what is known as the Hungarian. This is really an English fruit; but it is of no use for drying, for, though it grows to the size of a pear, it is sour, and has very little flesh. Mr Burbank has created another big prune, the Sugar, which is very big, and has a good market. The difficulty with the Sugars is that they are heavy, and have to be picked, as they burst if allowed to drop. These prunes are largely used for 'facing,' as they make a fine appearance when the boxes are opened. Two other large prunes are the Imperial Epineuse and the Robe de Sergeant, both delicious, and commanding large prices.

The important prune of the Santa Clara valley, however, is the Petit D'Agen, a French variety which has no equal. It has a very high percentage of sugar, is a dependable crop, and has a delicate flavour. I know of few things more delicious than a shining black Petit D'Agen hot from the drying-tray. When in the fresh state they are liked by many for the honey-like juice which they contain. The dark kind of prune contains more sugar, and thus weighs more, than the lighter. Formerly packers who found themselves with the red prune, an inferior fruit, on their hands used to 'process' it by dipping it into glucose and logwood to give colour and weight; but this is no longer permitted. There used to be a market for the silver or white prune. However, some grasping dealers substituted for the prune the egg-plum. Now, while the silver prune is a most delicious thing when dried, the plum cannot be eaten. So the market was killed, and the dealers were put out of business.

Prune-growing pays well. The average crop is four tons per acre of fruit, although it has been known to run as high as twelve tons. With proper pruning and cultivation the prune-rancher has an assured and pleasant living.

SOME HINDU SERVANTS.

By CHARLES NIBBS, F.R.G.S.

THE differences between housekeeping at home and in India are very striking and often bewildering to the new arrival in the East. The shortage of servants is by no means acute in India, but the domestic problem has its own peculiar difficulties. An aggravating duplicity covered by apparent guilelessness is an outstanding characteristic of the native servant, and this tends to ruffle the temper of the sweetest of *mem-sahibs*, already harassed by life in the tropics. The Hindu servant has absolute faith in British fairness, tempered by a wholesome dread of his master's anger, which, however, is considered unreasonable under any circumstances, but is usually excused because 'Shaitan takes him for his own'—literally, 'the Devil enters into him.'

The *bawarchi* (cook) is a most important personage, and it is marvellous what he can do in an emergency. In camp let him have a *murghi* (fowl), some Worcester sauce, and anchovy paste, and he will serve you quite a decent dinner, the 'fish' being composed of minced bits of the fowl liberally mixed with anchovy, whilst the Worcester is the basis of the soup. It is customary to give the *bawarchi* a sum of money daily so that he may purchase fresh necessaries in the *bazar*. Of course, he will bargain with every one with whom he has any dealings, so it is wise to allow him plenty of time for this task. A carefully written account of what he has spent will be given to the *mem-sahib*, but this by no means tallies with the actual disbursement, the difference always being in his favour. You know perfectly well that on nearly all the items you are paying him half-an-anna or an anna more than the market prices, but you are content to leave it at that unless the discrepancy be too great. Then comes the fight for the odd anna; you probably win on the day, but the *bawarchi* wins on the week.

I had a very capable man who, upon my questioning him, frankly acknowledged that he reckoned to make two rupees a week by this method, so for curiosity's sake I said, 'Very well, *bawarchi;* I will add an extra two rupees a week to your pay on condition that there be no bargaining, and that you charge me fair prices only.' He was delighted at earning the additional money so easily, but at the end of the month begged me to 'cut' the two rupees, and let him go back to the old system; 'bargaining' was such a real pleasure to him that in consequence of there being none he was losing health. So back he went, quite joyful at the prospect of a daily battle of words and, presumably, recovered health. It is the immemorial *dustoor* (custom) of the country, and, because the East is the East, changeth not.

On one occasion another *bawarchi* charged me five annas for a small purchase, a fair price being four and a half annas. On my pointing this out to him with some asperity, he salaamed very profoundly, and said it was his misfortune that he could not pronounce 'four and a half' correctly, as he had lost some teeth, so always had to say 'five annas,' which caused him no difficulty at all. This preposterous apology almost took my breath away; but, controlling my face, I said very sympathetically that I was exceedingly sorry for his misfortune, but that I, too, suffered from a peculiar deafness, and, therefore, whenever I heard him say 'five annas,' I should write down 'four.' This style of argument appealed to him much more than any form of vituperation, and I had no further trouble.

It is of no use asking a servant the reason for any dereliction of duty. Plausibility is a fine art. 'Why has this place not been cleaned to-day?' 'Oh, *sahib*, if I clean it to-day, it will be dirty again to-morrow, so what is the good of cleaning it to-day?' The only safe method is the direct 'Clean it.' Then in the eyes of the servant it becomes an order, *hukhm hai*, something sacred, and so must be obeyed. The somewhat apologetic and polite form of request will probably have no effect at all; the man thinks you are not in earnest.

A very intelligent *khansama* was explaining to me how very clean the Hindus are in comparison with Europeans, in spite of the two baths daily the white man finds necessary. 'If I want to brush my teeth, *sahib*, I take a piece of fresh wood from God's own tree, fill my mouth with heaven-sent water, and use the frayed stick as a brush; but the *sahib* takes the hairs of an unclean dead animal, fixes them in the bone of another unclean animal, and then puts all this uncleanness into his mouth.' So does the humble and necessary tooth-brush appear to the mind of the Oriental, and therefore we are unclean in the using thereof. Needless to say, this view had not occurred to me before.

In the *bazar* I was usually followed by one particular coolie, whom I called 'Gold Teeth' by reason of his expensiveness in the matter of dental repairs, of which he was very proud. He was of a merry disposition, and had the nimble agility of mind we usually associate with the London street-arab. Seeing a very dirty specimen of the *fakir* class sitting in the *bazar* silently begging, I asked Gold Teeth who and what he was. I was anxious to know in what category a *fakir* would be placed in

the Hindu mind. My surprise—and disgust—may be imagined when the coolie, pointing first to the *fakir* and then to an English clergyman standing near, replied in broken English, 'Hindu padre, Christian padre, all one same fella.'

The beggar asking an alms to buy food will often enforce his appeal by opening his mouth wide and saying, 'See, *sahib*, I have had no food; my teeth are clean.' He is a living comment on a verse in the Book of Amos (iv. 6), where famine is predicted by the prophet under the phrase 'cleanness of teeth.' Indeed, it is sometimes startling to hear a familiar phrase from the Bible used by one who has probably never heard of the book. A coolie was calmly squatting on his basket early one morning, and about six in the evening I saw him again. Apparently he had not moved, and on my asking if this were the case, and the reason, he said, '*Sahib*, no man has hired me' (Matt. xx. 7). In a dirty little by-street half-a-dozen women and several children were making a lot of noise shouting and dancing. I soon found out the reason for this *tamasha*. An old woman had lost a four-anna bit earlier in the day. Now, after a lot of trouble, she had found it; and her neighbours were rejoicing with her. (Luke xv. 9.)

During the monsoon season one of my servants came limping to me, complaining of severe pains in his legs. He had a touch of rheumatism. I intended to give him some embrocation, but as I had no 'Elliman' by me, I got an empty bottle, and beginning with mustard-oil and kerosene, made a mixture with all sorts of ingredients. The more I put in, the better pleased the *mehta* seemed. Next morning he had completely recovered, and had evidently spread the fame of the *sahib's* new medicine, for the *khitmatgar* took an early opportunity of saying, 'Please, *sahib*, give me some of the new medicine to put on my baby's eyes, which are sore.' As the stuff was not a cure-all, I had to refuse; but no explanation of my reason was of any use. He was convinced that I wouldn't give it to him because he was not a 'favourite' servant, whilst the other man was.

The *dhobie* was an unfailing joy. He washed clothes beautifully, but tore them indiscriminately. Isn't it Mark Twain who says that the *dhobie* is a native of India who earns his living by breaking stones with a shirt? At any rate, this fairly indicates the methods employed by the *dhobie* who conscientiously tries to live up to his reputation. He never wrote down a list of the things he took away, but very rarely made a mistake. In some Oriental way he had Pelmanised his memory, and as he took to his *dhobie-khana* about a hundred pieces weekly from my house, and presumably similar quantities from one or two other *sahibs*, one may gain some idea of his mnemonic powers. His excuses for damage were always original, though not convincing. 'The bull ate it, *sahib*,' 'The wind blew a hole in it,' are specimens of these. For some reason he was dismissed, but was not dismayed, for he brought me a letter which he had got a public letter-writer to put into English for my benefit, in which he said: 'Since master and missis came from London you have been the father and mother of me and my family, for so therefore give me back my employ, which act of mercy I shall always be your obedient servant, or else I shall die.' He was duly reinstated—not because of the truthfulness of his plea, but because we wanted him.

One sometimes thinks that all Hindu servants are past-masters in the art of lying, but this is not so. It is merely a question of a different code of ethics. Before answering a question a Hindu will look into your face, trying to discover what kind of an answer is likely to be most pleasing to you, and will answer accordingly. His intention is to please his master, not to evade the truth—that is only a secondary consideration. It is awkward and inconvenient at times; but when you grasp the mentality of the man, it only means a few more questions adroitly put, and the truth, as you understand it, is then told.

THOUGHTS.

(ON GOING UP AN OLD CHURCH TOWER.)

'Tis said that he who upward turns his gaze
From the deep darkness of some well or mine
Can see, although the world above's ablaze,
The stars in sunlight shine.

So, when we sink to depths of dark despair
From what have seemed to be life's brightest hours,
We must remember in the hours of care
God does not hide the stars.

This spiral staircase is our life below,
Spent much in darkness and in narrow ways,
Yet brightened ofttimes by a happy glow
Even in darkest days.

And we who climb the narrow stair aright,
Thankful for those bright glimpses on our way,
Will surely reach the summit where the night
Will merge into the day.

And having gained the summit, we shall see,
With eyes that trust no more to fitful gleams,
That glorious landscape spread around, which we
Knew only in our dreams.

Then, looking out across the sunny land,
This new wide world, with everything made clear,
We may begin at last to understand
God's purpose for us here.

PART I.

And she filled their mouths with dust
And their bones with fever;
Greeted them with cruel lies;
Treated them despiteful-wise;
Meted them calamities,
Till they vowed to leave her!
RUDYARD KIPLING—*South Africa.*

I.

THAT precise zenith of sun which they keep for broiling the brains of Europeans in those parts (the head of the negro is impenetrable to anything save bullets) had just about become intolerable even to the wild folk—the red rocks were blistering to the touch—except the brilliant blue and cream lizards, rigid as Roman fibulæ; and Idzimba, the hill-leopard, had just woke up, literally, to the fact and to the necessity of seeking a shady cave, when his half-shut green gaze lit upon the sandgrouse.

Because Nature had obligingly painted him to match his surroundings; because, more certainly, the wild eye is, in nine cases out of ten, unable to detach the motionless living form, the sandgrouse was there, within two yards. It was feeding, that sand-coloured spirit of the sand. Presumably it fed upon sand—there seemed nothing else. Needs but for Idzimba to draw in his padded hind-legs with that concentrated caution known only to the cats. Needs but, as if by magic, to transform from a sensuous wonder of spotted plush into a tense set spring of nickel-steel, and—and—!

Two thumps; an olive streak; *and*—! Yes, as I said, Idzimba *and* the 'old man' chacma baboon face to face, almost nose to nose, watching with one eye apiece the horrified sand-grouse exploding rocket-wise from between them, and with the other eye, amazedly, each other.

Till that ill-omened instant neither beast had possessed the faintest suspicion of the proximity of the other. If they had, you can take it from me, they would have gone very far to avoid so embarrassing a meeting—they who were, in fact, anathema to each other. But then, perhaps, you do not know the chacma, that dog-faced calamity, half devil, half monkey, nearly as big as a man, with the strength of three men and the wickedness of thirty. Even Idzimba, that incarnation of silent-footed, lightning death, had cause to know and respect the chacma's power. (Besides, the small matter of a baby baboon, snatched in the blackness of a rain-squall from its sleeping mother's breast only seven nights ago, might still have to be paid for.)

Then was seen that super-agility of the leopard-people which never fails to amaze every time it is witnessed. It was almost exactly as if an enormous ball of thistledown had been caught by some sportive puff of wind and blown up the cliffside. In point of fact, it was Idzimba. He was facing the brutish scowl of the baboon one instant. The next—he was crouched, with tail lashing, wicked ears folded back, fangs glinting, fifty feet above. He seemed to have made no effort in getting there—to have occupied no time. He was not there. He was.

Then the 'old man' chacma coughed a hoarse bark, and ere its echoes had ceased the side of that hill was alive with male chacma baboons, all hurrying to his rally-call. (The females and young were over the ridge, all running the other way.) If they could have cornered Idzimba, they would have torn him into unholy strips, for he was the bogey-man, he, of the baboon babies, the death they could not see through the viewless nights, the maker of the scars more than one among them would carry to the day of their death.

Wherefore Idzimba faded backwards discreetly into the gray shadow of a narrow cave. They could come at him there—if they dared; but must face him singly, him who was Nature's last word in perfection for the cramped fight. They did *not* dare. With the glimmerings of a soul, the germs of an imagination, not a baboon among them but feared the unknown terror of confined spaces.

II.

A little before the almost precise six o'clock sunset of those parts that should relieve the gasping red earth of its torment somewhat, Idzimba, the hill-leopard, woke up.

From where he lay he could view the wilderness spread out, all bird's-eye-view-wise, as it were, at his feet; could see the strings of antelope—buffalo-like gnu, fiddle-faced hartebeest, stag-like waterbuck, stately Grant's gazelle—the

 [*All Rights Reserved.*]

kicking, bucking zebra, the supercilious ostrich, the towering giraffe—all filing down, under endless drifting dust-columns, along the age-old game-paths, to water. He could even hear the nasal laugh of the zebra, the resonant 'Quank' of the gnus, the rattle of horn against horn as the bucks made play. And Idzimba yawned prodigiously in the bloodshot eye of the sinking sun. He stretched a lean paw, and scraped unsheathed claws. He had beheld it all before, that scene—bush and plain, impenetrable thicket and stilled waste, beast and bird; how often had hearkened to the unoiled cackle of the guinea-fowl going to roost, and the ringing triple call of the bulbul bird. He had seen and heard it all before, and it bored him unspeakably, in his sleek, cynical comfort, as only a cat can be bored, and —and then, suddenly, his gaze became fixed, focused. What was that—that tawny speck that appeared for an instant in the path amid the patch of phœnix palms leading from the native village to the water? By fangs and whiskers!—two tawny specks, looking darker than usual at that distance. Leopards! As Idzimba lived by bloodshed, the specks were leopards! Leopards assuredly; and who should know, if not he, that they were male and female leopards? They vanished in an instant; but he had seen enough—enough to jerk him up on his feet, growling, eyes aflame, restless tail twitching, as if they were at his very side, instead of a mile or so away.

Now, the leopard begins his scalp-hunting much earlier, as a rule, than the lion, who can fairly safely be depended upon—always excepting a man-eater—not to make things dangerous before about 9 P.M. Moreover, the spotted one is of a strangely silent—as he is of a lonely—disposition; whereas *Leo Rex*, who is more of a sportsman than most people give him credit for, generally announces in bass thunders, which none save the stone-deaf for miles can fail to hear, that the king is coming for his cess. The short twilight of the tropics had not yet completed its transformation-scene when Idzimba, the hill-leopard, earlier than usual even, floated —I have no other word for it—from the hills and his cave down to the darkening plains. None saw him go. Nobody heard the click of a displaced stone even, nor swish of camphor-bush. Even the Chanler's reedbucks, those delicate antelope spirits of the rocks, whose enormous ears and high-set eyes miss so little, failed to give warning of his passage. He passed as a bad dream might pass—leaving, as a bad dream might leave, only uneasiness and trembling behind.

But if Idzimba's descent from the hills was (seeing that it was still day) one miracle in its stealth, his progress to the path among the palms where the yellow specks had momentarily appeared nearly a mile away was another miracle, and a greater. From the moment that the spiked mimosa thickets embraced him at the foot of the *koppjes*, save for one quick chatter of a pretty golden-red and black Sykes's monkey seated high upon a juniper-tree, and the sudden, startled 'Go away! go away!' warning cry of that feathered mop, a gray lory, there was no sight or sign, not the ghost of a sight or a sign, of his passage, till his appearance, with as startling suddenness, as incredible swiftness, in the native path leading from the village to the river. He was sniffing at the tracks of those two yellow specks—leopards, male and female, as you will remember.

What followed was a white light upon the ways of the leopard-folk. Still sniffing the ground with more than the patience, but none of the celerity, of a hound, Idzimba followed the trail into the heat-blasted thorn-scrub at the side of the path. For perhaps a couple of hundred yards, always painfully slowly, always in dead silence, frequently from tips of twigs and grass-blades as high as himself, he followed it, among thorns six inches long, straight and curved, capable of vandyking the insides of infants, till he came to the foot of an immense baobab-tree—large, round, almost, as a house—and here he stopped and looked up. The trail ended at that spot.

III.

Now, any other beast would not, probably, have looked up. If it had, it would not have seen anything. Nor, indeed, would Idzimba if he had not remained looking up, absolutely motionless, for at least five minutes. Then he saw, far above, the twitch of something black and small moving backwards and forwards quite regularly. It might have been the movement of a mouse or a big black-beetle. It was, as a matter of fact, the restless twitching of the very extreme tail-tip of a leopard—only *that* could be seen. The movement revealed it. Yet the whole of the beast was in plain view really, though deathly still—tawny and black, where tawny sun, dappled with black shadow spots, shone among the branches.

The leopard is a marvellous beast, but one is not, unless one knows him very well, led to expect him to run up the smooth, perpendicular trunks of trees, branchless, as the baobab was, to near its vast platform-like top. Here the branches stuck upwards and outwards at all angles; and here, couched, silent, motionless, reclined two leopards.

I have used the word 'couched' advisedly, because there is nothing in the English language that exactly covers that favourite position of all the cats, which is neither lying down exactly nor sitting up.

But cats, anyway, are funny things. Though they must have felt surprise, and *may* have experienced joy, at Idzimba's somewhat dramatic arrival, those two showed neither. They did

not move, in fact, except their heads, to watch him with inscrutable green eyes; and they never said a word at all. It was most uncanny, and savoured somewhat of the unreal.

Then Idzimba couched down too and looked at them, and—well, there you are, don't you know. They couched and stared, and there, so far as they were concerned, seemed to be an end. Very few Sphinxes can have shown less life than did those three ornaments of the great cat tribe thereafter.

The dusk brushed her wings drab across the face of the country, and a cock-ostrich began booming very far away out on the purple plains like a native war-drum, or a throbbing vein in a fevered head.

Idzimba got up and took three steps towards the female leopard. She was only a miserable little specimen, scarcely over five feet long, tail and all, and could not have weighed above fifty-four pounds at most; emaciated, thin-eared, but with a smouldering light in her eyes that was not nice at all. Quick as thought she half-rose, and with unsheathed claws struck—wheep—wheep—two round-arm blows with her right forepaw that, if they had landed, would have carried half of Idzimba's beauty away. And Idzimba? Oh, he never moved his body—only his head, drawing back in the nick of time one inch and a half, letting the blows whiz past his nose with half-an-inch to spare. That was all—as fine a piece of cool, arrogant judgment as ever you beheld.

Then the dog came down the path below—the starveling, half-wild, slinking effigy in canine guise of the usual negro village dog. One would have thought he was not worth anybody's kick, but all leopards are inordinately fond of dog. Indeed, the female leopard plainly showed her wishes by half-rising as if to spring, and drawing back with a wince and a snarl in a peculiar way as though something hurt her.

Idzimba, anyway, took her movement as a hint, and, being anxious to forestall the other male leopard — M'balana, the leopard of the plains — in that little, wicked she-beast's affections (as if she could have affection for anything in her cruel heart!), dropped like a stone, and with beautiful precision, smack upon the lean pariah's back beneath.

It was all over in three seconds. A streak of orange, an agonised howl, an electric convulsion of bodies among the dust, and dog *and* leopard flying up the huge trunk of the baobab again almost as quickly as the latter had come down—the dog in the jaws of the leopard.

But Idzimba reckoned without two important points. The howl. He should have choked the howl completely when he seized the important jugular. Also the Elmoran. Five of the Elmoran, each carrying the usual venomous spear, with its blade almost as long as its haft, had been walking down the path a hundred yards behind the dog—*their* dog. Had they been Indians now, they might have yelled and fled; but they were Elmoran, the young men of the Masai tribe, and the beast, lion or leopard, who would slay one of them, or theirs, and survive did not exist. 'Twas their boast. 'Twas their pride. They, the Elmoran, the young men of the proudest, most war-like, tribe in Africa, perhaps.

Before Idzimba had gained the platform-like top of the baobab, a shout spun him round, rigid as a steel-bar, in mid-climb. A spear gleamed in the last of the sun, blood-red, and stuck quivering in the bark by his side. The soft whisper of naked running feet—and who on all the earth can run like the Elmoran of the tall, proud Masai?—sounded below, and Idzimba, dropping the dog, leapt, leapt for his life, leapt far out and flying almost like a bird, a wonderful leap to the ground.

The next two minutes he spent moving from place to place in the thorn 'bush' on either side of the path with that flickering agility attainable only by leopards; while the spear-blades shimmered all around him, and everywhere he looked there seemed to be the dancing, dodging, ebon legs of men.

Fortunately no spear hit him. They all struck between the leaps, so to say. If even one had found him, it would have ended certainly one man's life, Idzimba's too, and this story. As it was, however, he got away, eyes blazing green-red, ears flat, tail whipping the dust like an angry snake, and in a vile temper even for a leopard.

Idzimba did not stop going for half a mile, and when he did, the night and a perfectly impenetrable reed-bed hid him together.

(*Continued on page 202.*)

THE FOLK OF THE 'MAYFLOWER.'

PART II.

V.

THE *Mayflower* was kept waiting at Southampton; but, after certain difficulties and squabbles among the merchants and the guarantors, the adventurers sailed 'about 5th August,' distributing their company of one hundred and twenty between the *Mayflower* and the *Speedwell*. It was found, however, that the lesser ship leaked badly, and her master refused to go farther without attention to necessary repair; so they resolved to turn into Dartmouth, where they lay for eight days, entailing loss of money, time, and fair wind. Again they set out; but when about a hundred

leagues from Land's End, the *Speedwell*, very falsely so called, could scarce be kept free of water, even by constant pumping. Both ships bore back once more—this time to Plymouth. There the *Speedwell* was declared unfit for such a voyage; so, after transferring some of her people to the larger ship, she went back to London; while the *Mayflower*, with a hundred souls on board, sailed on 6th September, hope at her prow and resolution at her helm.

On the outward voyage, after some days of fine weather, they encountered cross-winds and fierce storms, which bore upon her so heavily that the upper works of the *Mayflower* were strained to leakiness, and her mast cracked. She remained sound in hull, and accordingly, the mast mended by means of a large iron jack-screw which one of the company had brought with him from Holland, and the leaky planks caulked, they resolved still to go westward, though for days she could not bear a rag of sail, and drove, a bare hulk, before the gale. In all this one sailor died; one voyager, named Howland, was swept overboard, but clutching a halyard, was saved, to be a very useful colonist; one youth, a servant, died. Two births are recorded—one, Peregrinus White, born 'on board ship,' probably in the creek at Cape Cod, as the other, Oceanus Hopkins, is noted specially as 'born at sea.' Poor little Oceanus, however, died shortly after touching land.

They tried to run down southwards, seeking the mouth of the Hudson, but they fell into dangerous shoals and roaring breakers, and so struck northwards again for Cape Cod, getting next day, 11th November, into safe harbourage.

It was a grim welcome that winter gave them in that dripping ship. Winter had been waiting for them in a land of storms. The desolate wilderness lay before them, and behind them beat the gray and greedy sea. 'Sumer being done, all things stared upon them with a weather-beaten face.' The forests were full of questions of savage wrath and risk, and the master of the *Mayflower* was in haste to turn again for home, daily urging them to land and settle. They must get out and see where they might find a suitable place, near a creek which seemed to offer the advantage of a river, where, in days to come, trade might find a traffic-way. So, on 15th November, sixteen of them went forth to explore. They were fortunate in having with them a man inured to war, little of body, but big and brave of heart, fearing no man's face, and shrinking from no track, however lonely and awful—Miles Standish—who had trailed a pike in the Low Countries for Queen Elizabeth. They saw savages, found fresh water and good harbourage, a clearing and some Indian graves, and, under the sand, a cache of Indian corn in baskets, some of which they brought with them, thinking how the spies of old carried the grapes from Eshcol. On 6th December ten of them, with some seamen, set out in the shallop to explore the bay of Cape Cod, on the shore of which they saw some Indians. They encamped for the night, with careful barricadoes and sentinels, the experience of Standish keeping watch. The night was pierced with startling and hideous yells; the next day, as they were departing, the Indians attacked them with showers of arrows, but were driven off after a sharp fight. The handful of white men 'left some to keep the shallop, and followed them about a quarter of a mille. This they did that they might conceive that they were not affrade of them, or any way discouraged.' Their return voyage was full of danger. It began to snow and rain; the sea roughened overmasteringly; they broke their rudder, and with great difficulty two seamen steered with oars. The pilot had hopes of a harbour, of which he had hearsay knowledge; but their mast broke, their sail fell overboard in a swelling sea, and the shoreward-driving flood bore them into a creek. It was immediately found, however, to be a cove full of breakers, perilous before the wind; so, with a superhuman endeavour, they turned about for the Sound; and, though it was very dark and raining heavily, they struck shelter under lee of a small island, remaining there till morning.

The day broke in sunshine, and, landing, they rested over the Sabbath. They found the harbour fit for shipping, and marched into the land for a space, discovering some fields where corn had been, and 'litle runing brooks.' So they returned, glad of heart, with a report full of hope. And then they bore up in the *Mayflower* on 15th December, and next day reached the haven. They landed, according to tradition, on Forefathers' Rock. In 1741 a contemporary of the Pilgrims, the venerable Elder Faunce, identified the rock. Legendary reminiscence gave to John Alden the honour of being the first to land. It was the 21st of December.

IV.

They had hard and terrible beginnings. Their lot had cast them, in the worst possible season of the year, upon this shore, and the little company was kept from despair only by what Bradford calls 'the wisdome, patience, and just and equall carriage of things by y^e^ Governor and better part, which clave faithfully togeather.' But they had the awful trial of death early among them, so that in three months half of their number perished, for the most part of scurvy, sometimes at the rate of two or three daily; while, of those who remained, only about six or seven were able, imperfectly and with great difficulty, to help the others. Of these few, the Elder Brewster and Captain Standish are especially mentioned. They were very notable colonists, for in the general affliction they were not touched by sickness or misery. The

Pilgrims' first burying-place was Cole's Hill. The precious grave-plots were levelled, and sown with grain, lest the Indians should count them, and see how thin the ranks were growing, or should desecrate the holy dust. Add to the wretchedness of dwining sickness the skulking enemy, like shadows, creeping about close at hand, till one Samaset, who had been associated with Englishmen, and could speak the white man's tongue, came near to help them. He brought the great sachem Massasoyt, and Squanto, who was a constant interpreter and guide thereafter. The Indians nearest the settlement were at first not friendly, as they had been molested by an Englishman named Hunt, who had carried away some of them to Spanish slavery. Squanto had been one of those unfortunates, but, having escaped, he had somehow reached England, and had been brought back again as a servant to Captain Dermer.

In April 1621 John Carver was elected governor; but when, after strenuous labours and enlightened rule, he died, William Bradford succeeded. On 12th May of that year took place the first marriage in the colony.

Hobomack, a friendly Indian, and Squanto, having gone on business together, were waylaid by Corbitante, who hated the pale-face. Hobomack escaped, and brought tidings to the colony, fearing that Squanto had been slain. Stirred by the resolve to show that their messengers were sacred, the settlers sent forth the redoubtable Standish with fourteen men, to prove to the sachem that he was up against a new condition of things. They pressed through the forest, and surrounded his house. He was absent, but was impressed alike by the promptitude of the action and its forbearance also; for Standish, having severely wounded three Indians who had attempted to break through the cordon, brought them off with him, and when they had been healed in the colony, returned them to their own folk.

The contracts which had been come to with the guarantors in England now began to be fulfilled, by sending oversea clapboard and beaver-skins. The settlers were stirred also to the necessity of providing for defence. For, one day, from the Narragansetts, came a messenger with a bundle of arrows tied in a snake-skin in token of challenge. But the governor at once sent back the snake-skin with bullets and powder in it, an answer which the arrogant Indian would not accept, for fear. This challenge, however, impelled the colonists to enclose their settlement with a palisade, with gates and guards.

Some new blood had to be dealt with. The fresh arrivals were of much lighter stuff than the original company, many of them coming out after castles in the air. Sometimes there was a quaint humour in their treatment. For example, on Christmas Day the governor called all out to labour; but these declared it to be against their conscience to work on that day. On such a ground he at once excused them. But when he and the rest returned, tired, at noon, he found the conscientious ones at various sports. So he took away the implements of their games, telling them it was against his conscience that they should play while others worked. And the hint went straight to the mark.

1623 saw the colony hungry. A ship came with some of those who had been left behind; but when they saw the condition of the people ashore, they were 'danted & discoraged, distressed and greeved, . . . many were ragged in aparell, and some litle better than halfe naked. . . . But for food they were al alike. . . . The best dish they could presente their friends with was a lobster, or a peece of fish, without bread or anything else but a cupp of fair spring water.'

Undoubtedly the original settlers were built of the stuff of victory. For eighteen years all laws were enacted by the colonists in general assembly. Each member had to take his share of public service, and was fined if he refused to bear the burden. With all their progress and courage, however, it was little wonder that there were flies in their amber. They had to stamp out sins of the old world that crept into the settlement of saints, as foul bilge, over the sea.

In 1691 they joined with the Puritans who in 1629 had formed a settlement in Massachusetts Bay; and the colony of Massachusetts was thus brought into being.

Their enterprise is worthy of remembrance by all. As one of the letters to them from home put it: 'Let it not be greeveous unto you y^{t} you have been instruments to breake y^{e} ise for others who come after with less dificulty. The honour shall be yours to y^{e} worlds end.'

The few pages of record of the folk and their fortunes at the end of the book can scarce be read without a lump in the throat. The book bears the marks of a scholar, and has references to Marcus Aurelius, Plato, Pliny, and others.

It is hoped that at all celebrations hereafter may be sung the words with which Bradford closes one of his chapters:

'*Our faithers were Englishmen which came over this great ocean and were ready to perish in this willdernes; but they cried unto y^{e} Lord and he heard their voyce, and looked on their adversitie. Let them therfore praise y^{e} Lord, because he is good, & his mercies endure for ever.*'

Nothing could more finely express the splendid faith which lifted them over the trembling edge of venture, and the spirit which made them persevere and endure.

THE END.

BIRD NOTES FROM THE BRITISH NORTH PACIFIC COAST.

By Charles E. Alford.

I.

THE portion of the North Pacific coast to be dealt with in this article extends, roughly, from the mouth of the Skeena River, between the 54th and 55th parallels, southwards to Vancouver and Victoria, the latter city lying slightly north of latitude 48°—a distance of approximately 500 miles—and comprises those regions that lie to the west of the Coast Range and the Cascade Mountains, including the Queen Charlotte and Vancouver Islands.

From the Skeena down to the northern limits of Vancouver Island and the adjacent mainland, the country is mountainous, densely wooded, and sparsely inhabited. The summers are mild and humid, but the winters vary in different localities, being generally less severe on the islands than on the mainland, with a precipitation averaging from seventy to a hundred inches, most of which is rain.

South of this region, however, we get into a more civilised zone. Though the country still presents a rugged appearance, large tracts of cleared and cultivated land and thriving little townships, with their quaint wooden dwellings, form pleasing gaps in the grand but monotonous panorama of the forest. The rainfall, too, gradually decreases as we go south, until at Victoria we find an annual precipitation of only twenty-eight inches, with a climate very similar to that of Devonshire, but drier and brighter. At Vancouver, on the mainland, and only about sixty miles north east of Victoria, the rainfall is much greater, averaging no less than sixty-one inches, though in other respects the climate is very similar. Throughout the coastline, nearly all the rain falls during the winter months.

The scenery in the more wooded and mountainous regions strongly resembles that of the Scottish Highlands, but on a grander scale, the timber consisting chiefly of cedar, spruce, and Douglas fir, a tree that often attains a height of 250 feet. The more open and cultivated districts, on the other hand, have a rather homely, 'Old Country' air about them; and though the fields seem strangely silent without the trill of the skylark, and the absence of our familiar hedgerows gives a somewhat unclothed effect to the landscape, the country-side wears, on the whole, a very 'English' appearance. The coastline, throughout its length, is very broken, the numerous bays and inlets affording shelter for many species of water-fowl, which come southwards in the winter months from their breeding-grounds in the chilly north.

From the foregoing it will be seen that, from both a climatic and a physical point of view, the conditions in the Old Country and the coastal regions of British Columbia are not at all dissimilar—a circumstance that makes a comparison of the bird-life in these two widely separated portions of our Empire a subject of particular interest. There is, however, one difference: Great Britain is an old country; British Columbia is an entirely new one. And when one considers the development that is now in progress throughout this part of the world—when one gazes upon the wide stretches of meadow and orchard that were but recently a mass of tangled undergrowth, and the vast tracts of virgin forest that still remain to be cleared—it is reasonable to assume that the feathered population of these regions has not remained entirely unaffected. There can, indeed, be no doubt that, as regards both their diet and their general habits of life, the birds of western Canada are rapidly adapting themselves to the changing conditions; and I find that, in the 'Wild West' as in other parts of the world, it is amid the habitations of man that we must search for our feathered friends, and that the forest, with certain exceptions, has little to offer in the way of bird-life.

II.

Though one sadly misses our favourite songsters, they are represented in several cases by other, if less attractive, members of the same family. In place of the throstle, for instance, we find the russet-backed thrush, a quite diminutive member of the *Turdidæ*—being but seven inches in length—and a summer visitor only. Apart from its smaller size, however, it bears a strong resemblance to our own bird, being a typical thrush, in both song and habits, though its vocal powers are not to be compared with those of its British cousin.

Instead of the blackbird we have the western robin—a pale variety of the American species—with a bright-red breast, yellow bill, and upper parts of a dark slate-gray. Abundant everywhere, it possesses the usual characteristics of the family, including a fine voice; but the notes are rather harsh, and recall more vividly the wild strain of the missel-thrush than the flute-like music of the blackbird. A considerable migration occurs during the autumn months, at which period large flocks of these birds may be seen everywhere. But the movement is more or less local, and others appear to take the place of those that have departed.

There is no familar redbreast, unless some of those imported from England a few years ago have survived. But a distant cousin of his, the bluebird, holds much the same place in the popular imagination, being not only an

extremely beautiful creature, but—like the redbreast—of a sociable and confiding disposition, preferring the habitations of man to the dreary solitudes of the forest. To attract him to your garden it is only necessary to provide a few nesting-boxes, and he will show his appreciation of your hospitality by remaining with you all through the summer, and helping to rear two—perhaps three—families before the breath of winter drives him southwards. In the southern parts of Vancouver Island, however, a few remain throughout the winter, though at all seasons of the year I have lately found the bluebird less plentiful than it used to be.

The western variety of this species has the upper parts a rich blue—'bluish lilac' may, perhaps, give a better idea of the shade—with the breast pale reddish. The song, though weak, is sweet and restful, like the singer; to me he is the very embodiment of peace and beauty—a 'Peter Pan' bird, sent from the 'Never-Never-Land' to soothe the hearts and delight the eyes of mortals.

The skylark, like the redbreast, was imported several years ago, and is said to have been heard quite recently in the neighbourhood of Victoria, but I have not had the good fortune to meet with it. The meadow-lark (*Sturnella magna*), which abounds at all seasons in the fields and open spaces of the West, is not a true lark, but belongs to the starling family. Though a poor substitute for the glorious songster of our homeland, he is a fine musician, and sings, moreover, all the year round; no weather, indeed, seems sufficiently cold and dismal to damp his spirits, and I have watched him pouring forth his cheerful ditty from the top of a telegraph-pole in the teeth of a north-east gale. He is a pretty bird—brownish-gray above, and bright sulphur-yellow beneath, with a black crescent on the breast.

Of all the singers of the West, the nearest approach to the nightingale is found in the rusty song-sparrow, a relative of the bunting family—as are most of the American 'sparrows'—and a common resident. He is, without doubt, the finest songster in western Canada, the purity and fervour of his liquid notes, and the intervening 'chug-chug-chug' that recalls so vividly the music of Philomel, entitling him, in my opinion, to a place in the front rank amongst the feathered minstrels of the world. Like other fine performers, he is modestly clad—rusty-brown being the prevailing colour of his garb, with a white breast streaked brownish. Though found in all localities, he prefers the neighbourhood of water; indeed, the individual that inhabits my garden seems to regard as his own particular property the bird-bath which I have provided for the use of my feathered visitors, and drives off all intruders with angry pecks.

Another member of the same family is Nuttall's white-crowned sparrow, one of the most abundant species on the coast during the summer months. The plumage of the body is not particularly striking, being yellowish-gray above and ash-coloured beneath, but the crown is a vivid white, bordered by a black streak on either side, which gives the bird a very distinctive appearance. The song, a feeble affair, may frequently be heard during the night.

III.

A large number of warblers visit the North Pacific coast during the summer months, but they differ in many respects from the true warblers (*Sylviidæ*) of the Old Country, being, amongst other things, more brightly coloured, and possessing nine instead of ten primaries. The lutescent and yellow warblers are the species most commonly met with. The former is of a beautiful olive-green all over, and builds its nest on the ground. The yellow warbler, on the other hand, nests in bushes, and is of a bright canary-yellow, with red streaks on the breast in the case of the male; but the female is olive-green all over, and can hardly be distinguished from the lutescent warbler.

The goldcrest is represented by the golden-crowned kinglet, an almost identical bird; and it may generally be seen with the flocks of chickadees during the winter.

Of the titmice, the chestnut-backed chickadee—a close relative of our marsh tit—is the only common representative found in these parts. In the winter months it roams about the country in flocks, and the cheerful 'Chee-chee-chee' of a troop as it passes through the garden, busily searching the nooks and corners of the bushes for the small insects on which it feeds, makes a pleasing interlude to the silence of a dull winter's day.

The wren is represented by *T. hiemalis*, a bird so similar in every respect to our own species that it is difficult to see exactly what is the distinctive feature that entitles it to specific rank.

A handsome species that is commonly met with on the coast is the cedar bird, a small edition of the waxwing that occasionally visits Great Britain. Of an extremely sociable and amiable disposition, it travels about in flocks, the members of which display an extraordinary attachment for one another. In this connection Nuttall relates an amusing story of a number of these birds, which were perched in a row on the branch of a tree, refusing to eat an insect caught by one of their companions, each one being too polite to accept the proffered morsel, and passing it on to its neighbour! This species utters a peculiar lisping sound, which makes its presence unmistakable, though it can hardly be called a song.

Of the swallows, three species are commonly met with, the most observed being the violet-green (*Tachycineta thalassina*), with upper parts of a beautiful velvety-green, and pure white beneath. The barn swallow (*Hirundo erythro-*

gaster) is hardly to be distinguished from the swallow of the Old Country, and is equally plentiful. The rough-winged swallow (*Stelgidopteryx serripennis*) is a sober-coloured bird, resembling our sand-martin, and, after the manner of that species, nesting in holes in sandbanks.

The house-sparrow is, unfortunately, increasing, though not yet nearly as abundant as it is in Great Britain. In its place we have the Oregon junco, a little brownish bird of the same size, with jet-black head and neck, gray breast, and horn-coloured bill. Though not a true sparrow, it possesses the same quarrelsome disposition, and is, moreover, a common resident, being especially plentiful during the winter months in the vicinity of houses and gardens.

One species that should be mentioned here, because it is so abundant, is the Oregon towhee —or 'chewink,' as it is locally called—a handsome member of the *Fringillidæ*, about eight inches in length. It has the upper parts, including the throat, a rich black, with a few white spots on the wings; a red iris; flanks bright red; breast and belly white; and a long black tail. A distinguished-looking bird, it rather reminds me, at a distance, of a bullfinch with a very long tail, though at close quarters its appearance is entirely different. Essentially a bird of the undergrowth, it spends all its time scratching amongst the leaves, and, being extremely shy, is more often heard than seen. It sometimes makes a sound not unlike the 'mew' of a cat, but the usual call-note is a mournful 'Too-ee, too-ee,' constantly repeated, and is one of the most depressing sounds imaginable.

The jay found in this part of the world is a very beautiful creature, with plumage of a rich, dark blue, shading into black towards the forepart of the body, and with a conspicuous black crest on the head. Contrasted with that of the British species, his is a richer, more exotic type of beauty, and by many he might be considered the more handsome bird of the two; but it is like comparing the orchid with the rose, and I would rather have our more homely-looking, but no less beautiful, British species than fifty blue jays. Retiring to the seclusion of the bush during the nesting period, he spends the remainder of the year wandering about the country in little parties of four or five individuals, creating disturbance wherever he goes; indeed, the constant screeching he keeps up outside my study window sometimes becomes almost intolerable. In the suburbs and outlying districts of Victoria last autumn they appeared literally in hundreds—dozens of them being seen in every street—and in a letter to the local paper a well-known naturalist of the district spoke of it as 'an invasion unparalleled in the memory of the oldest observer.' This species is a perfect tyrant over the smaller birds, and a terror during the nesting season, and that is why I don't love him.

Another common species, though not so plentiful as the last, is the Oregon jay, a gray-and-white bird, about the size of a missel-thrush. Better known as 'Whisky Jack,' he is a familiar visitor to the logging-camps on the mainland, but seems to avoid the vicinity of the sea and the adjacent islands.

The rook is unknown, but in its place we have the north-west crow, a closely related species, but somewhat smaller, and more partial to the seashore. Here it spends most of its time, either picking about the rocks for the shell-fish which form so large a part of its diet, or else robbing the gulls and generally making itself objectionable to all birds that happen to cross its path.

In a country so densely wooded, it is not surprising that the woodpeckers are well represented; and of the nine species that are met with along the coastline, four, at least, may be called common, and will be mentioned here. The northern pileated woodpecker is a large, handsome bird, having a dark-brown body, relieved by a white stripe down each side of the neck, and a crown of deepest crimson. An inhabitant of the thickest and most lonely parts of the forest, it is extremely wild and difficult to approach, and, though still tolerably plentiful in suitable localities, is one of those species that the march of civilisation is gradually driving towards extinction. Another, but more abundant, member of the family is the flicker, a bird about the size of our 'yaffle,' but of quite a different appearance. It has the upper parts brown, barred with black, and the head and neck gray, with a conspicuous crimson patch beneath the eye; the breast is pinkish-white, spotted with black, and adorned with a large black crescent. This species has a curious habit of picking at the woodwork on the outside of houses, and sometimes does a considerable amount of damage. For some time I was unable to discover the object of these attacks, but I have recently been informed that the timber used for building purposes harbours a special kind of maggot—which, of course, explains everything. The two remaining species—Harris's and Gairdner's woodpeckers—are hardly to be distinguished, at a distance, from the barred and great-spotted varieties of the Old Country, though a closer inspection of the plumage reveals obvious differences. They are both plentiful.

IV.

In one respect the bird-lovers of the West have some cause to exult over their brethren of the Old Country, for they can boast one species of feathered visitor that is altogether unknown in the Old World. This is the rufous humming-bird—a little creature about three inches long—that arrives from the south with the first warm days of spring, and penetrates as far north as Alaska. To those unacquainted with the

humming-bird, it may best be likened to the British hawk-moth of that name, which it resembles, both in its manner of flight and in its appearance, at a distance, when on the wing. To describe with any accuracy, however, the plumage of such a gorgeous creature would tax even the vocabulary of a Meredith; but the distinguishing feature of the species under notice is a gorget round the throat, that reflects in the sun's rays almost every shade of gold and crimson, and simply dazzles the eye with its splendour. Arrived in its summer quarters, it loses no time in settling on a nesting site—frequently amid the haunts of man—and here it builds a most beautiful, cup-shaped little nest, composed on the outside of moss and lichens, and lined with plant-down. It is placed on the horizontal branch of a bush or a sapling, and may be found in the most public situations, such as the front garden of a bungalow, or in a tree by the side of a busy thoroughfare.

It is strange that all efforts to acclimatise the humming-bird in Great Britain should have invariably failed, because the average summer weather in the Old Country is certainly not more severe than that prevailing in some of the regions visited by this species in its northern migration.

The *Alcedinidæ* are represented by the belted kingfisher, a larger and less brightly coloured bird than the British species, but a handsome fellow, nevertheless, in his soft gray-and-white plumage, and magnificent crest. Of a noisy disposition, and abundant everywhere, there is hardly a stretch of seashore or river on the coast where the harsh, laughter-like cackle of this little angler may not be heard. One little chap frequently takes up his perch on the dead branch of a tree in my garden, which overlooks the sea, and will sometimes remain there for an hour or more, apparently lost in a reverie. When I appear on the scene, he blinks down at me in such a comical way, and appears so confiding and trustful, that I have become quite fond of him, and look forward to his visits with much more pleasure than I do to the calls of my neighbours.

The cuckoo (*Coccyzus Americanus*) that visits the North Pacific coast is a more respectable individual than the European species, preferring to build a nest of its own, and otherwise attending to its family duties, instead of thrusting them upon some smaller but more worthy parent, after the manner of its British cousin. Though not uncommon on the mainland, it is rather rare on the islands of the coast, and avoids the more northerly latitudes.

Of the order *Striges* the California pigmy owl is the species most commonly met with. A little, insectivorous bird—barely seven inches in length, and diurnal in habits—it may frequently be seen perched on the telegraph-wires in the noonday sun. It possesses a rapid flight, and appears to have the habit of returning to the same perch after each excursion in the air.

Other common owls include the western horned, dusky horned, and short-eared.

Of the *Falconidæ*, the bald eagle still holds its own in the more inaccessible regions, where rocky precipices rise abruptly—like great walls—from the bays and inlets of the sea. In such localities it may often be observed, sailing majestically along at a great height, and providing, in my opinion, one of the finest spectacles in bird-life that nature has to offer. In the Old Country I have made many efforts to see an eagle, but so far without success; and it was in Canada that I was destined to have my first view of this magnificent bird in its natural surroundings. Though I have yet to make the acquaintance of the golden eagle of my own land, I have had the good fortune on several occasions in this country to watch the bald eagle through a strong pair of glasses—a magnificent sight as it glides beneath the blue vault of heaven, turning its head downwards at intervals, to right and left, in search of its finny prey; for, like the osprey, it is a fish-eating bird. About the same size as the golden eagle, it has the head, the neck, and the tail pure white, and the remainder of the body dark brown.

Like other splendid specimens of its race, the bald eagle is much persecuted by those degenerate individuals who, whilst admiring a stuffed carcass, quite fail to appreciate the real beauty of life and movement with which it was once endowed; and though it is in no immediate danger of extinction, the large number of stuffed specimens to be seen in the offices of hotels and other public places throughout the country hints darkly of the future.

Another fine bird that is, fortunately, not uncommon at present is the osprey, to be found in most suitable localities.

Of the smaller birds of prey there are several species, all more or less plentiful. Amongst them may be mentioned the sharp-shinned hawk, about the size of a large thrush; the marsh hawk; the red-tailed hawk; and sparrow-hawk, the last mentioned being related to our kestrel, and a very pretty bird.

During the winter months the numerous bays and inlets of the coast literally teem with duck of all descriptions, and afford a good opportunity of studying those species whose breeding-grounds are situated in the remote regions of the interior, and of whose habits and mode of life so much has yet to be learnt. The mallard, the harlequin duck, and surf and white-winged scoters remain throughout the year.

Amongst the more abundant winter visitors to the coast may be mentioned the scaup duck (bluebill); the buffle-head, a very handsome little duck, with vivid black-and-white plumage; the American golden-eye; and the red-breasted merganser, the last mentioned remaining throughout

the year in some districts. Of the geese, the black brant is the one most commonly met with. I have spent hours watching these ducks diving, and have many notes on their habits in this connection, and their behaviour under water, so far as it has been possible to observe it. But information of this description, to be of any value, must be based on many years of observation.

Game birds include the common pheasant, the sooty grouse, and the Oregon ruffed grouse. The pheasant is very plentiful, penetrating even into the outskirts of towns, and during the summer I have heard them constantly on the vacant lots and building-sites in the suburbs of Victoria. The partridge of the Old Country is unknown, but there are two varieties of quail—the California and the mountain species—hardly to be distinguished from each other at a distance, though the former has the plumage somewhat darker. They are handsome little birds, with a pretty black crest on the crown, and have the habit of perching in trees. The call-note resembles the words 'get right back' or 'get right out.'

There are a great many gulls, of which the glaucous-winged is the most abundant, although the American herring-gull is almost as plentiful. But my favourite is Bonaparte's gull—a small, neatly built bird, only half the size of the herring-gull, and in my opinion the most beautiful member of the family—excepting, perhaps, the kittiwake. Breeding in the interior of the province, it visits the coast only during the autumn and winter months, and at these seasons has the mantle pale gray, and the remainder of the plumage white, with the exception of a black spot on the ear-coverts. But in summer the head and the neck are black, and make a beautiful contrast with the gray and white of the body. It is an active little bird—even for a gull—seldom resting upon the waters like the larger species, but constantly circling overhead, and swooping, at intervals, to the surface to seize the small fry upon which it feeds.

Amongst other species of water-fowl, all more or less plentiful, may be mentioned the violet-green cormorant, the tufted puffin, the loon, the pigeon-guillemot, and several kinds of grebe, of which *Podiceps auritus*—the horned grebe—is the most abundant.

With a few exceptions, the birds described in these notes represent the quite common species that one meets with every day. There are, of course, many more; but to describe in detail the life-histories even of those mentioned in this article would fill a volume. And though, in the case of some species, lack of space forbids more than a mere mention of their names, enough has, perhaps, been written to afford the reader at least a glimpse of the bird-life of the North Pacific coast.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER III.—*continued.*

IV.

BOTH Heloise and the companion had gone up to their rooms a prey to emotions. Heloise's emotion was not altogether unpleasant. She was agitated at the prospect of an intimate talk with Clement Seadon on the morrow; but, like all people who trample on their feelings in order to bolster up their pride, she felt relief that this condition of chilly aloofness between them was coming to an end. As Méduse Smythe had told Mr Neuburg, Heloise did not know exactly what her feelings were towards Clement Seadon, but she did know enough to realise that a renewal of their old companionship would be an extraordinarily pleasant thing.

Méduse Smythe's agitation was of a different order. There was fear and mystery in it. She had received an imperative message from one of the conspirators; he wanted to see her in the hotel lobby. That fact in itself was disturbing. Joe, who had made this demand, would not have exposed himself unless the matter was crucial. Also, he had disguised his handwriting. She hurried swiftly to the lobby—and there was no Joe. Nobody was there wanting her. What did it mean? Had Joe been frightened away? Or—or was it some ruse? She did not know. She was puzzled, scared. She felt that her own wits were not capable of dealing with this matter.

She left Heloise (grappling with the feminine complications of preparing for a walk) in her room, and passed swiftly across her own. She slipped ajar her door of the bathroom that led to Mr Neuburg's room, and scratched stealthily on the inner door. That was the signal. She repeated it several times. It was not answered. Mr Neuburg was not in his room. She half-expected that. That might be the reason why Joe had sent in to her. Quickly she returned to her own room, closing the bathroom door softly behind her. Her anxiety was increased. She must see and speak to Mr Neuburg. It might be a matter that did not brook of delay.

Méduse Smythe's agitation developed steadily until both ladies got down to the lobby again; then, with a gasp of relief, she said, 'Oh, there's Mr Neuburg. Do you mind, Loise? I do want to speak to him about something before it slips out of my memory.'

She went across to Mr Neuburg, who rose from his chair and bowed with all the affability of a mere chance acquaintance. In quite an ordinary voice, as though discussing the weather, Méduse said, 'I am going to give you a slip of paper. It seems important. Can you take it from me without being seen?'

Mr Neuburg, with all the charm of a genial man of the world, and all the acuteness of a master-rogue, bowed at once, led her to the magazine-counter to the right of the lobby. 'My dear Méduse, as I select a guide-book for you, lean across me to reach those post-cards; then you can drop your paper.'

The call-form that was supposed to have come from the man Joe was dropped. Mr Neuburg picked it up with a guide-book. He read it. He opened the guide-book, as though in search of some locality, pointed to a page with his fat finger, and said, 'When did you get this, Méduse?'

'It was brought to me by a page, just after I had sat down to lunch.'

'Ha—and you went out at once, and Joe—he was not there, of course. He would not be there. This is a thing he would not do.'

'He was not there,' said Méduse.

'And when you came back from this false call, how was the girl?'

'She was alone—as I left her. She seemed the same.'

'She said nothing to you—about anybody speaking to her, I mean?'

'Nothing at all.'

'And the Englishman—did you see him in the dining-room?'

'No, I did not see him. But, then, I did not look very keenly. Surely the Englishman does not know about Joe?'

'Somebody knows about Joe,' said Mr Neuburg, his voice hard in spite of his intensely amiable attitude of a man giving local information to a lady. 'Somebody knows so much about Joe that he recognised that the name was enough to get you away from Miss Heloise into the lobby at a run. Who do you think would pull off a trick like that, my mild Méduse?'

'But the Englishman cannot know about Joe,' said the woman sullenly.

'Certainly this is your day for being triumphantly dull, my dear. This Englishman has bewitched you.'

'But how could he know about Joe?'

'Ah, my mild one, that is a thing that even I cannot tell you without finding out. It is to be found out. Now go back to the girl with this guide-book; tell her the pleasant Mr Neuburg has recommended it as the best of its kind—and remember that if your brain has turned into wool, you have the support of mine, which is particularly acute. That may restore and stimulate your wits.'

V.

When the two ladies had gone out, Mr Neuburg sat and smoked, and considered this unexpected happening deeply. His was a quite exceptional brain, and he had mastery over his thoughts and his memories. It was while he was going over his memories that the smoke of his cigar suddenly ceased to puff. That was the only sign exhibited by his impressive, placid, and genial bulk. He was a traveller taking things easily—only, suddenly, his cigar ceased to puff.

At once he rose indolently, walked across the lobby to the reception-desk. He asked in his affable way if he could see the room bookings. He looked through them. He stopped when he came to the name 'Clement Seadon.' He stopped with reason. He saw that the number of the room booked against Clement Seadon's name was 362—the room next to his own. He stared at that number for a moment, said 'Thank you' very politely to the reception-clerk, and mounted to the gallery on which his room stood.

He went not merely to his own room, but walked round the corner of the gallery to the door of Clement Seadon's room. As he stood there regarding it contemplatively the chambermaid passed by. He looked at her, or, rather, across her shoulder, with that smile which was quite charming, but had not the slightest tinge of human emotion in it, and he said, 'There is, I think, a blind in that room which is making noises in the wind. It destroys my nap. I have knocked on the door, but the occupant of the room is not there, apparently. Would it be asking you too much to go in and pull up that blind, so that I can have my beauty-sleep undisturbed?'

He backed his appeal with the weight of a half-dollar piece.

The girl smiled back, nodded, felt in her pocket for the key of the room. She began to open the door. With a polite, 'Thanks enormously,' Mr Neuburg slipped away from her with his extraordinary swiftness. He went into his own room. He opened his one of the double doors between his room and Clement Seadon's bathroom. He listened at the other door. He did not hear as well as Clement had heard, for the bathroom was between him and the Englishman's room. But he heard. He heard the movements of the chambermaid, heard her rattling at the windows. He heard quite distinctly.

When the chambermaid came round the corner of the gallery to ask if it was all right now, he was at his door beaming—but this time, perhaps, with a more natural good-humour.

'Yes, that is satisfactory—*very* satisfactory.'

And indeed he thought it was.

VI.

As the massive Mr Neuburg sat in his room certain that things were satisfactory, and thinking these satisfactory matters out, Clement Seadon, with much the same emotions, was searching for and finding the glue-maker's in the Sault Algonquin.

The street was as unprepossessing as he imagined it would be. It was a narrow canyon, indescribably gloomy and muddy, between the tall, old, straight-faced houses that lined it. It was farther round the toe of rock that made the jutting mass of the historic old town than he had imagined. It was right round under the splendid old seventeenth-century hospital, the austere Hôtel-Dieu, and in the area of the docks, too. From the docks it got some of its mud, and, perhaps, some of its lowering air. It looked a darkling, brooding, sinister street. Clement found it quite easy to imagine it a place where, in the grim old days, bravoes quietly and expeditiously slit throats, or where fur-hunters had been lured to be despoiled of the earnings of long, lonely months of trapping in the virgin wilds of the young colony.

In this old and moody street, and in the grim and reticent houses that bordered it, almost anything might have happened in the early days of Canada; but most of those things, Clement thought, would have been evil. The street had an aroma of crime. One felt it, as it were, in the air, just as though centuries of wickedness about its narrow, greasy side-walks had saturated it with an essential aura. It was a street fitted to be the headquarters of Mr Neuburg and his gang of ruffians.

It was a short street, and it was easy to find the glue-maker's. There were only two other business premises. The glue-maker's, No. 7, was a tall, depressing house that was even dirtier than its neighbours. It had the distinction of keeping all its windows shuttered. The shutters were the lattice-like jalousies of France; but whereas the neighbours kept theirs open, No. 7's were tight closed, as though its inmates were determined to keep themselves to themselves. It had one window on the ground floor; the shutters were back from this, but as it was filled with trade samples and backed by trade advertisements, a view of the room behind was impossible. There was no doorway on to the street. Entrance was effected through a cartway. A heavy wooden gate covered this, with a smaller door for humans in it. As both were shut, Clement surmised that, having passed through this gate into the cartway that ran under the building (which made one of a block embracing all the houses on that side), one entered the house itself by a doorway on the left.

However, this cartway told him one thing. In spite of the fact that the cliff seemed to rise up right behind the house, there must be a yard at the back of the glue-maker's. Glancing along the face of the houses, he obtained confirmation of this. There was no iron fire-escape stair in front of this house and its immediate neighbours, although farther along the street this inevitable disfigurement of Western cities zigzagged down the faces of the buildings. That meant that the fire-escapes—by law enforced—were at the back, and that there were yards there into which people could escape.

Getting round to the back was not easy. He found he had to climb up the cliff, and when he arrived on top, he had to trespass into a builder's yard in order to look down on to the backs of the houses in the Sault Algonquin. Not wishing to be disturbed, he hid behind a pile of scrapped rubbish, and from there took a leisurely survey.

As he had thought, the farther end of Algonquin ran very close up against the cliff, and there were neither yards nor fire-escapes. As the street ran westward, the yards appeared and grew bigger, and the fire-escapes also showed.

No. 7 was easy to find. It was under the cliff where it sloped down rather less steeply. Clement noted that. At a pinch an active man might find a way down there. The yard was a fairly large one, littered with the rubbish of manufactory, and partly filled by a single-storeyed building, of very much later construction than the house itself. This had a flat roof and square walls; a jet of steam came out of a thin exhaust-pipe. Here, undoubtedly, were carried on the mystical processes of glue-making.

Clement studied the back of the house, and particularly the outbuilding, with care. Having shinned down the cliff, would it be easy for an agile man to leap from the cliffside to the roof of that outhouse? It looked possible; but, of course, one might be misled from here by the angle of sight. If one got on to that roof, one might avoid the embarrassing necessity of getting into the house by a door. A window, loosely jalousied, as were all the windows, was flush with the outhouse roof. If that window was no good, then the fire-escape could be used. The fire-escape was directly in line above the cart entrance, its loose lower section pulled up out of the way as usual. An active man would find a spring from the outbuilding roof to the last zigzag of the escape's permanent structure child's-play, and once on it, one had a choice of a window on every floor up to the roof.

If one had to force an entrance into the glue-maker's of Algonquin, that surely was the most discreet, and, indeed, the only, way; and a kindly dusk would make such an entrance easy. Clement Seadon felt that probably he never would have to undertake that action, but, as great generals and quite a number of other people know, it is always well to be prepared for any eventuality, down to the smallest detail.

(*Continued on page 197.*)

THE LAST VOYAGE.

By Ralph Durand.

I.

THE steam-tramp, ex-mine-sweeper, *Ocean Queen*, under orders from the Shipping-Controller to proceed to Genoa for transfer to the Italian Government, was butting heavily into a north-west swell, driven before a gale that blew keen and cold straight off the Alps. In the fuggy comfort of the engineers' mess, where the atmosphere was so thick that it might almost have been cut with a knife and handed round in slices, no mention was made of the weather. Custom debarred, during the dog-watch, topics in any way connected with 'shop,' and any reference to the gale would have brought up the question of the probability of something in the engine-room 'going West' if it continued.

The first-mate lounged in for his evening game of cribbage, and took a seat at the table. 'You two fairly give me the hump,' he said. 'One would think, to hear you fellows talk, that there was no place in the world but Bonnie Scotland. What 's the chance of getting home for Christmas, "chief"?'

'You ought to know better than me,' said the chief-engineer. 'Haven't you taken an observation lately? When d'you reckon we 'll get to Genoa?'

'Not before to-morrow night, unless the weather improves. But what I want to know is, will they let us hand over the ship and push off home as soon as we get to Genoa, or will they keep us messing about while they chew the rag and fill up forms and that sort of thing?'

'Why don't you ask the skipper?'

'I did. This morning. Fairly bit my head off! Called me everything in a farmyard except a duck! He 's more like a bear with a sore head than ever. Why don't you ask him, "chief"? You want to get home for Christmas as much as the rest of us.'

'More, probably. I haven't had a Christmas with my kiddies for five years. But he 's got so nasty-tempered that I don't care to speak to him more than I 'm obliged.'

'But you 're the best man to ask him. If I get him riled, he reads my log and passes nasty remarks about it, or asks me when the hell I 'm going to get finished with tarring the deck—as if any one in his senses would tar this weather! But he can't interfere with your job. You go and ask him.'

'If I did, as like as not he 'd make me say something I 'd be sorry for afterwards. Then, if he got spiteful, he might say something to the owners that wouldn't do me any good.'

'Well, I 've asked him, and he won't tell me. Come on, "chief." He can't eat you. Be a sport!'

Very reluctantly the chief-engineer undertook the errand. A blast of air that lowered the temperature by ten degrees rushed in as he passed out on to the deck, and the chief-mate ungraciously slammed the door on his heels.

The night was dark as the hobs of hell; only a confused blur of white water overside and a glimmer of light from the cook's galley showed in the gloom. The 'chief' grabbed hold of a stanchion and ducked his head as a wave struck the side and slapped the deck with a ton or so of ice-cold water.

'Streuth! If this is the Mediterranean,' he muttered, 'give me the North Sea.'

II.

The dingy apartment known as the captain's state-room was situated right aft, immediately above the propeller. As the chief-engineer entered it the captain looked up from a game of patience, grunted, and went on playing. The discourtesy was intentional, but to a certain extent natural. He and the 'chief' had been cooped together in the same ship almost without intermission for five years. They had long exhausted every topic of conversation that did not bear strictly on their business, and each had grown to have a strong distaste for the very sight of the other. The engineer stood with his back to the stove, his hands in his pockets, swaying easily to the motion of the ship, and staring at the faded photographs of ships and crews that were nailed to the bulkhead. Wearying of this—he knew every detail of each so well that he could have drawn them from memory—he turned his attention to the captain's canary, an apathetic-looking bird that had the appearance of having long given up all hope of ever finding any interest in life.

'Sing, Dickie!' said the engineer, and whistled a bar or two by way of encouragement. 'Come on, pretty bird. Sing!—Why don't that bird of yours sing, captain?'

'Got the hump, same as the rest of us, I suppose,' answered the captain.

He fumbled amongst the cushions of the settee, and produced an empty bottle and a cork, moistened the latter in his mouth, and by rubbing it gently on the glass produced a noise that more or less accurately represented the bird's normal note. With this to encourage him, the canary chirped half-heartedly for a while, but soon relapsed into melancholy. The captain resumed his game, and the engineer watched him.

'You can't build a knave on a king,' said the engineer presently.

'Who 's playing this game? You or I? I suppose I can play it any way I like.'

'Well, there's no sense in cheating, even if you're playing by yourself.'

'I play to amuse myself, not you. What's wrong with your blasted engines? Got the hiccups?'

'They'd have chronic appendicitis if anybody but me handled them. They're not fit for a steam-laundry. I told you last voyage they needed overhauling.'

'Well! And I told the owners, didn't I; and didn't the owners say that she'd have to carry on? If the Italians want the ship in such a hurry, let them overhaul her.'

The deck beneath them heaved mightily, the state-room shook, and all the hanging crockery in the captain's tiny pantry jangled. There was a crash and the sound of tons of water, racing along the deck overhead. The ship seemed to cower under the blow; then, as the wave passed, the propeller almost directly beneath their feet raced furiously, and the state-room rattled again more violently than before. Both men raised their heads and listened anxiously, but seemed reassured when they heard the engines, silenced for a moment, resume their irregular rhythm.

'We'll have to slow down some more if this goes on. The engines won't stand it,' said the captain.

'The engines'll stand it all right,' protested the engineer, with an anxious note in his voice. 'I'm watching 'em.'

'It's all very well to talk, but you know darned well that if anything goes wrong in the engine-room, we'll finish the voyage at the end of a tow-rope. I've got my duty to the owners to consider, and so have you. Come, out with it. You didn't come here to look at the canary, I suppose? What is it you want?'

Anxiety overcame the 'chief's' fear of a snub. 'What's the chance of getting home for Christmas?' he faltered. 'It's a two days' train journey from Genoa. If we get in to-morrow and they let us go the next day, we could do it. You know what the orders are. Will they let us hand over as soon as we get in?'

'What the hell d'you want to get home for Christmas for? D'you want to pull crackers and put a paper cap on your head, and look more of an ass than usual?'

'I've got kiddies, as you well know,' retorted the engineer angrily, 'whereas I suppose one pub's as good as another for you to get drunk in at Christmas-time.'

The captain had his weaknesses. When aboard he touched no liquor, and allowed no one else on board to touch it; but ashore, when he had no duties to owners or agents, he would sit by the hour in public-houses or wine-shops, speaking to no one except when he called to have his glass refilled. Not infrequently the effort to persuade him to go at closing-time resulted in broken furniture and broken heads. At the engineer's sneer he looked up savagely from his cards. 'You'd best keep a civil tongue in your head, Mr Andrews.'

Just then another great sea struck the ship. It roared overhead, and, instead of passing off through the scupper-holes, washed to and fro on the deck above them. The ship lost her way, and lay wallowing, half-submerged.

'That settles it,' said the captain. 'We'll lay-to till the weather moderates. Go forrard as soon as the worst of the water's off the deck, and slow down till you've only got enough revolutions to keep her head to the wind.'

'The engines'll stand it,' protested the 'chief' nervously. 'A wave like that don't hurt them to speak of. We're only going half-speed as it is, and I'm nursing them carefully.'

'My orders are to deliver a ship to the Italian Government—not a tank full of scrap-iron. I've just one more word to say to you, Mr Andrews. You'll either go to the engine-room and carry out my orders, or you'll go to your bunk and stay there under arrest until the British Consul-General at Genoa deals with you.'

'But, damn it, captain! it's my job'——

'That'll do!—Steward!'

In response to the captain's bellow a greasy individual appeared from the pantry, putting on his jacket as he came.

'Go forrard and tell the engineer on watch to put the engines at slow ahead,' said the captain. As soon as the steward had reached the deck he continued: 'Mr Andrews, you can consider yourself under arrest till I have you up before the Consul-General. Think yourself damned lucky that I don't shame you in front of your officers by confining you to your cabin. Now, get to hell out of my state-room.'

III.

Andrews obeyed sullenly, and made his way forward. All chance of spending Christmas with his family was now gone—and all because of one momentary flash of anger. Now, even if the *Ocean Queen* reached Genoa in good time, he would be kept hanging about there for days while the Consul-General took depositions and made out reports to forward to the Board of Trade. And when he did get home . . .! The owners would back up the captain. What did they care about a man spending Christmas with his family? He would be sacked from the company after fifteen years' service, and would be lucky if he got to sea again as second or even third engineer at a wage that would barely keep his family from starving.

As he crossed the streaming deck he noticed not only that the ship was riding more easily—the slowing down would account for that—but that the seas were lighter, the wind less strong. Even as he stood to look round him before leaving the deck, a rift appeared in the clouds,

and for one moment a star that seemed to race past the breaking clouds shone out.

'Gale 's breaking up,' he muttered. 'Damn and blast my infernal luck!'

IV.

At about nine in the morning of the next day but one the *Ocean Queen* dropped anchor in the outer harbour of Genoa. The captain issued a general order to clean up, brushed his shore-going bowler, hailed a shore-boat, and left the ship. As soon as his boat was clear of the gangway both mates and engineers crowded round Andrews to ask whether he had condescended before leaving to throw any light on the burning question. Since the 'chief's' anxiety on the subject, that had seemed so important the day before, was now merged in the greater problem of how he was to support his family in the future, he had little sympathy to waste on them, and, cursing fluently, they dispersed to their various duties. Their hopes rose slightly when, about midday, a clerk from the agent's office came off to the ship with a couple of barges and orders to the first-mate to start unloading the cargo and be prepared to work all night; but they lost what little comfort they derived from the order when the clerk told them that their chances of getting places on the Paris express were of the slenderest, since seats were usually booked a fortnight in advance.

It was midnight before the captain returned to the ship, and as he had to be helped up the side, nobody dared to ask him questions. When he reached the deck, however, he proved to be not so drunk as he appeared. Instead of going straight to his cabin, he lurched to the chart-room, flopped on to the settee, and sent for the ship's officers. One by one they entered, wilted under his stony glare, and stood silent, wondering what he had to say to them.

'All present?' grunted the captain.

There was a respectful murmur of assent.

'It seems you all want to get home for Christmas?'

Another murmur passed round the group.

The captain glared more savagely than ever. 'Pleasure! That 's all you fellows think about! Not a damned thought about what you owe to the ship! Not a care about your duties to the owners!'

The first-mate opened his mouth to protest, then wisely shut it again.

'Well, I 've worked it for you,' snapped the captain. 'You 're free to leave the ship as soon as the Customs open in the morning. That 'll give you time to buy rubbish in the shops to take home with you. The Paris express leaves at midnight. I 've badgered the agent into getting seats for you all. He had to oil somebody's palms to work the trick, so it 's up to each of you to give him ten liras, or thereabouts, for *backsheesh*. That 's all I 've got to say to you. You 'd best be getting your dunnage ready.'

The ship's officers murmured their thanks and hurried off, but the chief-engineer lingered.

'What about me, sir?'

'You? Oh, I 'll talk to you in the morning.'

With a heavy heart the 'chief' went to his own quarters. The younger men were talking and laughing as they sorted their belongings into what was worth taking home and what was only fit to be dumped over the side.

'Skipper's none so bad after all, is he, "chief"?' said the second-engineer as he started to polish his shore-going boots. 'What are you going to take home to the bairns?'

Andrews did not answer. Bad news was what he had to take home.

V.

The steward put his head in at the mess-room door.

'You 'd best go aft to the captain, sir. 'E 's 'urt 'imself.'

'How? He was all right a moment ago.'

''E was passing the after-'atch just as they was getting a sling-full of rails over the side. I dunno wot 'appened. Slipped, perhaps—there 's plenty ice on the deck. Or 'e may 'ave been dazzled by the cargo-light, or, bein' a bit fresh, didn't watch where 'e was goin'. Anyways, the rails swung towards 'im, and the sharp corner of one of 'em caught 'im in the side, just above the 'ip. 'E 's bleedin' something 'orrible.'

The 'chief' hurried aft, and found the captain lying groaning on the state-room table. The first mate was already there, stanching the wound with one hand, and with the other turning over the pages of *First Aid and Simple Remedies—a Guide to Master-Mariners*. The two did what they could, and then sat down to wait for the return of a boat that had been sent for a doctor. When the doctor came, his verdict was decisive. With care the captain would live three days, perhaps four, certainly not more than five, since it would be impossible in his condition to let him take either food or drink. The captain himself received the news stoically, and said nothing, except to give orders that word was to be conveyed to the chief agent to send a responsible clerk on board at the earliest possible moment.

The engineer sat down to watch by the side of the dying man, and passed the weary hours speculating how the accident would affect his own future. If the Consul-General had already been informed that he was under arrest, a report must go to the Board of Trade, and would eventually reach the owners. The owners, hearing only his version of what had happened, might possibly let him off with a reprimand. If the Consul had not been told—— But there would be the formal entry in the captain's log recording what had happened, and the owners

would inevitably see it. That would be enough to cause trouble even if nothing further were done. There was one gleam of comfort. Few master-mariners ever bothered to keep their logs up-to-date, and there was just a chance——

The lights of the state-room were dimming in the growing daylight when the captain next spoke. 'Did you tell any one you were under arrest, Andrews?' he asked.

'Not me. Was it likely?'

'Well, I didn't either, and I didn't put it in the log. We'll call it washed out. I just wanted to give you a lesson, that's all; there's nothing to hinder you pushing off as soon as you like.'

He closed his eyes and seemed to doze. The engineer noiselessly tiptoed round the cabin, turning off the lights. Then he opened the door, hesitated, turned and looked at the dying man, hesitated once more—and resumed his seat. When the agent's managing-clerk came on board, the 'chief' went to his bunk, lay down fully dressed, and slept. He roused himself at midday, packed his kit, carried it on deck, and hailed a shore-boat. He paced the deck impatiently till it arrived, then suddenly changed his mind, dismissed it, and went slowly back to the state-room.

'Why haven't you gone ashore, Andrews?' said the captain faintly as he entered. 'I told you you were free to leave the ship.'

'Oh, I'm in no hurry,' said the engineer.

'Thought you wanted to get home for Christmas?'

'So I did; but is it likely I'd go after what's happened? We've been shipmates five years and more.'

'Don't be a sentimental ass. D'you think I can't die without you to help me?'

The 'chief' did not answer, and the captain, exhausted with the effort of talking, closed his eyes. At four in the afternoon he spoke again.

'Why, damn it! you're still here, Andrews,' he said. 'What are you waiting for, man? You don't want to be at my funeral, do you? Do you suppose it will make me any happier to have you, with that long face of yours, slow-marching along the street behind the coffin? I've got no kith or kin for you to take the news to of how I was put away.'

'Hang it, captain! you can't expect me to leave a shipmate when he's dying.'

The captain murmured something about 'damned foolishness,' and lay still, staring at the ceiling.

VI.

At six o'clock the agent's clerk was called away to a meal in the engineers' mess-room. When he had gone the captain spoke again. 'I'll get you to do something for me, Andrews,' he said. 'Just come and loosen these bandages a bit. They're hurting me something cruel.'

'It can't be done. The doctor said you wouldn't live three minutes if the bandages were loosened. You've got to bear it.'

'Have it your own way, then. Are there any other officers left on board, Andrews?'

'None of them have gone ashore yet.'

'Blasted sentimental fools! I want 'em all to be home for Christmas. Tell 'em to go.'

The ship's officers were congregated in the engineers' quarters talking disjointedly, and much bored with each other's society. They listened to the captain's message, but each declared that he would 'stick it out.' The 'chief' took the opportunity to share the agent's meal, and together they went back to the state-room.

'Have they gone?' asked the captain.

'No. They don't care to.'

'Send word to them all to come aft.'

In a body the mates and the engineers entered the state-room, took off their caps, and grouped themselves round the table on which the captain was lying.

'I suppose you're hanging about here on board because you think that, as the ship's crew's breaking up, you can't buzz off till we've had a parting glass together,' said the dying man. 'All right, then. Tell the steward to bring glasses.'

In silence the glasses were handed round to each man present except the captain.

'What about me, steward?' he said.

The steward looked embarrassed. 'Doctor's orders you wasn't to drink anything, sir.'

'Doctor be damned! Give me a glass.'

The steward obeyed, and waited for further orders.

'You've got my keys, Mr Agent. You'll find a bottle of whisky in the starboard locker. It ought to be good. It's been aboard five years.'

As the bottle passed from hand to hand, those who knew the captain's weakness wondered at the resolution that had enabled him, with liquor aboard and available at any moment, to keep, while at sea, the iron rule of total abstinence that he enforced on himself and his crew.

'Here's luck,' said the captain when the glasses were filled. 'Merry Christmas to all.'

He drank and fell back with a deep groan. The glass fell from his fingers and smashed on the floor.

'Great Scott, look at that!' said the first-mate, pointing.

They all looked. A steady stream of blood was pouring from the table to the floor. They threw off the bedclothes, and wondered as they saw the wound exposed. The fingers of the captain's left hand were gripping the bandage that had covered it. With an immense effort of strength and will he had torn it off the wound.

The agent was the first to speak. He pointed to the captain's face. It had already become rigid, and the wide-open eyes stared unseeingly at the hanging lamp above him.

'There's nothing to keep you from catching the train now,' he said. 'He's done for himself. His last voyage is over.'

Chambers's Journal
SEVENTH SERIES

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

THE title of one of the daintiest books of my recent acquisition is *Madrid: Guia Sentimental.* Within the covers of black leather nicely embossed are graceful sentences and delicate thoughts to match. It is but a four-inch booklet. There is a little sketch at the beginning of my friend 'Azorin,' the author, a serious and solemn fellow, seated at his writing-desk, meditating upon these thoughts of Spain and her own Madrid, which he loves like the best of his people. 'Azorin' has written under the picture of the philosopher, who is himself, that he dedicates this copy cordially to me. For that I value it, but also because these thoughts within have assisted me to think a little more when in Madrid, and so the addition of my impressions and notes upon some passing fancies make of this little volume, that might almost be contained in a lady's purse, a veritable encyclopædia in its potentiality, more massive in its material for philosophy and reflection than any other of those appealing volumes we find in these days in the libraries of Madrid, where literary and publishing activity is great. Among the serio-sentimental writers, the gentle philosophers, those who lead us kindly to back-waters of this rushing existence, and there are pensive with us upon changing scenes and manners, calling up to our memories once and again some chaste and delicate trifle from the past, 'Azorin' seems to me the nicest, as he is the most popular, in all Spain. His style has much of the grace of that of Anatole France, wherein one pays to him the finest compliment; his essays have something of the same keenness of feeling, the rare perception of old sentiment. So also there is a light play of cynicism on nearly every page; but in this 'Azorin' is gentler than the others, restrains himself more. I became a spiritual friend of 'Azorin,' though I had not then met him in the flesh, on reading in a volume of his essays a dainty paper with the title 'Primavera, Melancolia,' a kind of account, with an enthusiasm suggested, of a friend who had wandered over Europe, and now, on returning, came to tell of the life he was about to lead in the little country place he had in Spain, the many things he would do in the house, the garden, and the fields every day; little things, common things; but dear and delightful things to the soul of this man who had just strayed about the continent of Europe and beheld its beauties and magnificences. He will take long walks over his property; he will observe and enjoy the country in its many aspects. In the evening, when the stars begin to shine and all is silent after the labour of the day, he will wend his way home again. Reaching his village, he will pass down some solitary street and hear played in the gloaming the notes of a piano, giving gently forth some old and romantic composition —played by white and delicate hands—and then he will feel a sadness, such a slight and indefinable sadness, invade his spirit. Within two hundred or three hundred years other notes as melancholy as these, as long, as suave, will be played in this same street, in this twilight, he thinks. Who will listen to them then? What dreamy hands will play them? What visions, what melancholies, will arise? And, with thoughts on an older and, as it seems in my memory, a better London of a generation since, I feel wondrous kind towards our 'Azorin' when he, too, tells me in this little 'sentimental guide' of his of the top back-room in Madrid of a long time ago, when with the sparsest possessions and materials, but an immensity of hope, he also wrote his first papers, and made his bold appeal to the Madrilenian editors. But 'Azorin'—who is indeed better known as such than as Martinez Ruiz, which, as a matter of law and baptismal actuality, he really is—looks back with gentle indulgence upon those pulsing, throbbing days, when, now a Member of Parliament, representing, as one would think, the constituencies of Philosophy and Remembrance more than any geographical district, he sits in his corner seat in the Congreso de Diputados, immediately behind his famous leader in high-class Spanish Conservatism, Don Juan de la Cierva. It seems to me, watching from the President's gallery at times, that while the Socialists and the Republicans are thundering out their challenges to Ministers on the blue cabinet bench, he must be dreaming there of those pulsing, throbbing days in old Madrid. It is inevitable. His little book indicates to me in many ways the likeness between the city of his adoption and my own. Its peevish critics

 [*All Rights Reserved.*]

suggest at times that Madrid is not a typical capital of Spain, that it is just there that the parliamentary and bureaucratic opportunists congregate to spend the money squeezed from the suffering provinces; but it is the centre of thought and all intellectual, artistic effort, as much as is London or Paris. Here youth with its determinations and its illusions comes; up from Galicia in the north-west it comes, up from sweet Andalusia, up from discontented Catalonia too. Youth when it comes speaks proudly and in some separatist manner of its native places. This fine young fellow is of Orense, this other of Seville, yon comes from Valencia, each repeating the name of his town with that sharp and peculiar emphasis that Spaniards always apply to the mother-name, *España*, and to their own quality as *Español*. There is such a crack of tone upon the central syllable, culminating with an explosive defiance upon the tilde 'n,' as is never heard on other people's lips, and with a glint in the eye, following upon the proud '*Soy Español!*' it seems to tell me always: 'I am Spanish of the great Spain of old and the Spain of to-day, still great despite her sufferings, rising to a new height again, with dignity and ideals always—*España!*' The artists, the writers, the political people, the ambitious of every kind, come to Madrid, bringing with them their local and general prides. Their country homes hold their affections and loyalty to the end, but Madrid becomes their intellectual home; the romance of their own effort is wreathed about it in their old memories; their attachment to it then becomes of the passionate kind. That is one reason why I treasure 'Azorin's' little sentimental guide and the personal inscription upon it, as from one of a kind to another of the same, if humbler. And upon a reaction, it sends me rummaging about Madrid, and wondering again upon the features of the new progress, the swift change that is taking place from the old Madrid of twenty years ago where Martinez Ruiz made his first pen struggles, the Madrid that seems to him, as he thinks upon it on his cushioned seat in the Cortes, to have been a symphony of the intellectual joys of life.

* * *

Feeling, after reveries of sentiment, we should for a spell be practical, let us turn to something most material in Madrid. There is an abundance for selection. It might be suggested that we have materialism in intensity at the banks. These of all things surely stand for mammon; it does not appear that there can be place for banks in any heaven, even though financiers themselves, with forgiven sins, were yielded eternal tranquillity there. And, as it happens, nothing could better prove some of our arguments upon the advance of Spain and the transformation of Madrid than a consideration of the banks of the capital, the new banks, most magnificent things that impress and dazzle every new-comer as hardly anything else in this changing, leaping city. The guide-books may give you to understand that, while there are the most magnificent cathedrals in all other cities of importance in Spain, and in some ancient places, like Toledo, which, held in turn by Romans, Visigoths, Moors, and Christians, have died away to a sleepy nothingness, there is none in the capital of the kingdom. It is an omission upon which Madrileños have at times experienced some twinges of their conscience, and the ecclesiastics, seeking to repair what they feel to be a peculiar and unhappy distinction, are building one near to the edge of the cliff of Madrid, by the royal palace, overlooking the vast plain that stretches to the west. But though Spain be a 'good Catholic,' as each of her individual children says of himself, the establishment of cathedrals is a slow affair in these present times, and this one lately seemed to be little more advanced than when I first contemplated it some seven or eight years back. Really Madrid is full of cathedrals; only, they are not like other cathedrals. The trend of things in Spain is progressive, commercial, materialistic if you will. Hence it seems to have been agreed that in the building of the new Madrid, that magnificent process which is advancing so rapidly and to the astonishment of occasional visitors, there should be many cathedrals, but that they should serve utilitarian ends. That is the general principle of new Spain. Thus we find that several of them, buildings as magnificent in exterior appearance as in interior equipment—with such dignity and solemnity as impress a new view of finance upon me as, with bared head, I move stealthily down these lofty-pillared aisles—are devoted to public and commercial purposes. Most of them are banks, but it was rightfully considered that the chief of them, the most magnificent, should be given not to the interests of any private or public company, but to the general municipal service. Therefore it became the Palacio de Communicaciones, the general post-office, the most marvellous, most splendid, best equipped for efficiency in the world. There is no other city that makes such a display of new and magnificent banks, and in this circumstance there is a sign, a correction, to those who think of this country as still sleeping, 'decadent,' given up to the *corrida*, and caring not for anything; in it there is a valuable hint to folks of enterprise. Each fresh visitor is impressed immediately with the number and the splendour of these new banking institutions. On a day of my last sojourn in Madrid a new bank, yet another, was opened at a corner of the Plaza de Canalejas, a small but handsome square, all new, opening out for a space in the Carrera de San Jerónimo, in the heart of the city, in some respects the best, if not the biggest, street in Madrid. This new-comer was an

American bank, branch of a great institution with headquarters in New York. The building, in the style of the Spanish Renaissance, which is favoured for the majority of the new erections in the city, is splendid, and for a feature it has a massive mahogany balcony on high outside, which, I am told, of itself cost the equivalent of some three thousand pounds. The bank is staffed by experts drawn from branches in New York, Mexico, and South America. All the nations seem to be building new banks in Madrid, but Britain has yet but one of them. Not many yards from this new American bank, another aiming at heights of splendour is being raised at the corner of the Alcalá and the Calle de Sevilla, the most perfect position. This is to be the Banco de Bilbao, and Bilbao, seeking to rival Barcelona, would make a display in the capital. There are three or four more new banks in the Gran Via, and others in the building. In this new quarter, planned to be one of the finest streets in the world, the Germans have made an imposing bank; the Italians, the Austrians, and other peoples have more, all new and fine. And here is the one London bank. Some of the old banks are enlarging their premises, and you cannot walk more than a few yards in this part of the city, round about the Plaza de Canalejas, in the Calle de Sevilla, along the Gran Via, and on the slopes of the Alcalá without the attention being charged by some new and impressive banking enterprise. That likeness to cathedrals was little strained. As banks these are beyond the imagination of such as only know banks in England, France, or even the United States; and remember that they are mostly built by foreign nations, who thus express their belief in the future of Spain, and their desire to please and impress the people and the commercial elements now. The South American banks—here again a sign—are the most remarkable. Already we have spoken of one of them, the majestic affair the building of which presented a problem to Don Antonio Palacios. This is the Banco Español del Rio de la Plata, at the foot of the Alcalá, the issue from the instruction given to Señor Palacios that on the limited space of land here available he should build something that should bid defiance to the rest. From the street, from the roofs, from an aeroplane, from everywhere, this marvellous bank stands forth in its neo-Grecian style, with its Corinthian columns at seventy thousand pesetas each. The great entrance with its decorative iron doors or gates, twenty feet or more in height, is in itself a piece of splendour. Admitted to this cathedral, we halt awe-stricken upon the threshold, staring in surprise. Marble and brass, gilt and glass—nothing else it seems. Brass-edged counters of marble, floors of marble, lofty pillars, towering cathedral windows reaching high to the top, the whole just one great splendid hall from floor to stained-glass attic high overhead. A gallery of gilt surrounds it half-way high. There are no staircases, just several massive and quietly decorative lifts, nothing to impede the effect, to mar the most perfect convenience. I have adopted the cathedral fancy because I could not describe this place to British people in any terms of banks.

* * *

On the other side of the Calle de Alcalá there is the Banco de España, mother of them all, built a generation back when Spain believed more in herself than others believed in her, and this bank now holds two or three times as much gold in its cellars as ever it hoped to have. A bank indeed! Vast halls, endless corridors, luxurious chambers with wonderful carpets, and costly pictures by old masters on the walls; marble everywhere, majestic staircases, and a dim religious light falling from stained-glass windows above and at the sides. Clearly this is the Catedral de Santo Dinero! Humble and solemnified, a spell upon me, I wandered along these corridors out of banking-hours, when by some honest but stupid accident I stumbled into the secretary's private room, no person then occupying this imposing chamber. Appreciating the mistake, I was moving out again, when Don Orestes Blanco Recio, the very secretary, stood in the doorway. He met me, a foreign stranger, leaving the most particular and private apartment in the national Bank of Spain, at a moment when it happened that apartment had been unoccupied. These circumstances, with a significance and some infinite possibilities, swam through one's senses. Clearly, were not embarrassment relieved by considered action, the case might be troublesome. Señor Recio stood in the doorway, not threateningly, half-understanding and perhaps waiting, as it seemed. I explained, tried to apologise. And then Don Orestes by his manner and conduct taught me again, as I had been taught before, the full meaning of that glorious Velasquez in the Prado Museum, one of the greatest and most impressive pictures in all Spain, 'The Surrender of Breda,' wherein we see the sublimest Spanish courtesy, the utmost nobility in the expression and manner of the victorious commander towards his surrendering foe. This Spanish gentleman hushed my poor excuses, spoke gently, kindly, to me, and, taking me by the hand, showed me all the rest there was to see, relating the wondrous story of banking Spain. . . . Were such notes as these but an affair of stones and decorations, the space would be lost, but those who have need of business, and have brains for it, may think again.

* * *

Too often does it happen in modern communities that when commerce and manufactures surge, art and beauty are crushed or lapse to a vulgarity;

but there is evidence continually in these times of the flaming vigour of artistic Spain; always, indeed, a master-artist she has been. Lately there has been an exhibition in London of the works of Spanish artists past and present, which has been at the same time an infinite delight to our people and a grand surprise. This of itself has caused them to cast about and think of Spain in a different way, for they have said to themselves rightly that the nation that could do these things, that had this artistic soul, must be splendid still. In recent times I have been looking on newly painted pictures in exhibitions in Madrid, Seville, and other places; there is a life and a freshness in them that one scarcely finds so plentifully in the works of artists in other countries now. They are glorious, encouraging, animating in their colour; pride and hope are told in them, and something of the love of life and the beauty of it, even in these times when world-worn men and women so often doubt. Blues and grays of stern Galicia; energies of Catalonia; the reds and gold, the flashing eyes, the bewitching beauties of Andalusia—the Spanish painters with charmed brushes are setting forth the wonders of their land as only they can do. In music and literature Spain rises also. But a wanderer, especially if he know a little of the language, is often most impressed with the remarkable circumstances of the Spanish theatre. A traveller should always visit a country's theatres as frequently as his situation permits. It is a detail that it is one of the best ways to accustom himself to the language; he will also in this way as in no other learn much of the manners and customs, the thoughts and impulses, of the people. In all circumstances the theatre is an education; it is more than ever so to the foreign student of a nation. The theatre of Spain is a great and wonderful thing. Always a feature of the national life, always vigorous and in some respects more fecund than the theatre of any other country, it is remarkably so at the present time. Recently at the same time two Spanish plays were being acted in London, one the work of Martinez Sierra, the other of Jacinto Benavente, who is, if it could but be realised in England as it is elsewhere—the United States, for example—one of the finest dramatists the world has produced for a very long time. Again, it was said in London that it seemed strange that such good things came from Spain, and it was asked if there could be more of them. Truly so. Indeed, the Spanish theatre is a thing of itself. Now, the other night, at a quarter past ten, when the evening performances mostly begin, I turned into a theatre in Madrid, and had an excellent seat in the second row of the stalls, or the *butacas*, as they are called in Spain, to witness a representation of Benavente's famous comedy, *Las Rosas de Otoño*. It is one of the author's best pieces of work, belonging to his earlier period, satirical like all, but not so sombre as much of his later writing. For my seat I paid two pesetas, or one and sixpence, as one might say. Theatre-going is a very cheap affair in Spain. There was an absence of gilt and velvet; there was little of the richness of elaboration and decorative effect on the stage and off that we see in London; but the play, the acting of it, is the thing after all, and, this being well done, the rest did not matter. The piece is a favourite with the Madrileños. They are a strongly emotional and sentimental people, and this drama is a story of domestic misunderstanding and final adjustment. It is a satire upon middle-class married life—the husband inclined to go astray, the wife bitter and complaining, an ultimate understanding and complete reconciliation, with a long speech of adoration by a repentant male. It was this that so much touched the señoras near me, and made their husbands squirm. They saw themselves as Benavente meant them. He, who has the fecundity of the Spanish playwrights of the golden age, has written about a hundred plays or more; he produces them as easily as one might write light impressions of visits to their performance. I talked to him of his ways and fancies one afternoon in the reception-room of the Teatro Español, and jestingly complained to him that in that year he had produced but one new play, fine one though it was. 'Well,' said he, for excuse, 'with five last year, may I not be forgiven for but one this time?' A strange man is this, a little, nervous man, of strong independence and individuality. He writes his plays, his masterpieces (read *Los Intereses Creados* in Castilian, or even in translation, for full justification of the term), on any bits of paper that may be convenient, and he writes them in cafés, in omnibuses, in any place where he happens to be at a moment when a fancy seizes him. At two in the morning you may find him in a *tertulia* in a certain café—not one of the most elaborate—in Madrid. Benavente smiles pityingly upon the conventions and the stupidities of life. And there are many other distinguished Spanish playwrights. There are those famous Andalusian brothers, the Quinteros, surely the most extraordinary collaboration that dramatic literature has known. There are mysteries in this wonderful combination that seem at times beyond the comprehension of the admirers of the brothers, who one day in their flat in Madrid took some kindly pains to expound to this interested wanderer their marvellous secret—that of a perfect unity and sympathy to begin with, and then, above all, the abolition of every trace of *amour propre* as between themselves in their work, leading to the extinction of difficulties and to reserves in the determination when differences in point of view and desire had seemed to arise. Then there are Pedro Muñoz Seca, a writer of light comedies who has lately been stepping towards a kind of melodrama, and others. The

theatres of Madrid are a system to themselves, and admirable in their way. Some, like the Español, a sort of national theatre where all the classic Spanish dramas are played, municipally subsidised as it is, are very large; there is the Princesa, which is the fashionable theatre, and is generally occupied by the leading actress of Spain, Maria Guerrero, and her husband; there are big and handsome houses like the Centro and the Apollo, elegant places like the Eslava, and some old-fashioned and small establishments like the Infanta Isabel, where often good comedies are produced. In Madrid and elsewhere there are, according to the Spanish system, two performances a night at every theatre. The play staged may or may not be the same at each; in any case, the bill is frequently changed during the week. It is a system that is necessary to the people and the country. It would seem to put a strain upon the performers, but they are like the playwrights, wonderful in their capacity. The foremost actor of Spain, Enrique Bórras, a man of fine emotional capacity, told me that he could at any time, at a moment's notice and without any prompting, play any one of a hundred parts; and Ricardo Calvo, leading actor at the classical Español, assured me that at one time in the provinces he had played some fifty or sixty parts in a season. As I write, Catalina Bárcena is playing the heroine, Eliza, in a translation of Bernard Shaw's *Pygmalion* at the Eslava. A few nights ago I went to see it—at the afternoon performance, *por el tarde*—and observed that the lady had to take the lead in two other plays later in the same evening. But these are only as the beginning of the features, strange and impressive, of the Spanish theatre.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER III.—*continued.*

VII.

WHILE Clement was studying the house—in fact, before he had half studied it—he became suddenly conscious that some one else had entered the builder's yard where he had hidden himself. A young, slim man came casually into view, strolling with hands in pockets towards the edge of the cliff. Clement crouched closer in his shelter, and prayed that this workman—for that was what the young man seemed—had no business which would bring him round the pile of scrapped rubbish forming his own shelter.

Then, as he thought this, he noticed two peculiarities about the man. The first was that, in spite of his casualness, in spite of his air of being there naturally and by right, the young man had no more right to be there than himself. He was throwing keen, swift glances about him; he had a furtive mien, as though he were doing something that he did not want other people to see.

The second thing about him was the colour and the outline of his features, as well as the lithe slimness of his build. His face had a curious copper brownness that might have been sunburn, only it was deeper than sunburn. His features had a definite aquiline clear-cutness; rather individual features they were—like an Indian's.

Clement tingled as he thought that. And even as he thought it the slim man moved abruptly and swiftly to the cliff, glanced along it, and in a moment was descending the sloping face of it.

Clement stared and chuckled. And he muttered, 'Siwash Mike! By all that's lucky, it's Siwash Mike come to Quebec to report on the doings and whereabouts of Henry Gunning.'

There could be little doubt about it. The colouring, the features, the very furtiveness of the slim man (who was probably a half-breed with Siwash Indian blood in him) went to prove the fact. And he was making his way, in such a fashion as to escape detection, to the glue-maker's of Algonquin, the place where he was to report. From his hiding-place Clement followed the stranger's movements. They were sinuous and swift, veritably an Indian's. The man wriggled down the cliff by known footholds, reached the back-yard of the glue-maker's, poised for a moment just above it, and sprang lightly on to the flat roof of the outbuilding—then that was possible. Clement saw that there was a ledge along the cliff that made the take-off for the jump easy.

Once on the roof, the slim man again adopted his casual air. He was to all appearances an occupant of the glue-factory taking an airing on the roof. He dawdled about, hands in pockets, looking about him, up to the cliff, along the backs of the other houses. Then he strolled towards the house, poised himself on the edge of the roof just by the fire-escape. He jumped, caught it, scrambled on to the landing. Very calmly he walked up the iron stairway until he came to the fourth floor. The window of the fourth floor was shuttered, but apparently not bolted, for the slim man opened the shutters without effort, slid through them into the house, pulled them to after him, disappeared.

Waiting for a minute or two, Clement presently backed away from the shelter of his scrap-heap, and, without disclosing himself to the houses below, made his way out of the builder's yard.

He had discovered two very important things. The first, that Siwash Mike had returned to the glue-maker's to report the whereabouts of Henry Gunning. The second discovery was that there was a way into the glue-maker's from the back.

He hurried back to the Château Frontenac. He was anxious to know what the massive Mr Neuburg, his bedroom neighbour, made of the first fact, and how far his own knowledge of the second fact was going to help him to discover Mr Neuburg's future plans.

VIII.

While Clement Seadon had been active Mr Neuburg had not been idle. He had sat and smoked for a while. Then, having decided upon a plan, he rose and searched for something in his baggage. When he had found it, he opened the first of the two doors between his room and Clement's bathroom, and for several moments did something to the foot of the second—that is, Clement's—door.

Having done this to his complete satisfaction, he sat and smoked and thought again. Three minutes after the time Clement had seen Siwash Mike enter the glue-maker's, the telephone-bell rang in Mr Neuburg's room. With one glance at the floor near the door he had just shut and bolted, he rose and answered the ring.

What he heard over the wire gave him apparently a pleasant surprise, for, though his curiously impassive face showed no sign, he said, 'Eh, but you have been quick. I did not expect you for a day or two. . . . No; say nothing now. . . . I will see you this night, about ten o'clock. And now, listen'—— And in his slightly purring voice he gave a string of directions. They were very guarded—for telephones have eavesdroppers—but quite explicit to understanding ears.

He hung up the telephone, dropped back into his chair again, and thought and smoked. But after a perceptible minute this curious, immobile-faced man allowed himself the luxury of a great laugh. It was a terrible laugh, but a short one. It was perhaps well it was so, for very soon after he had indulged in it there came at the communicating door the scratch which betokened that the woman, Méduse Smythe, had returned to her room, and was ready to serve him.

He sprang up at once, and again glancing at the floor by the other communicating door, went across immediately and opened the door behind which Méduse stood. The woman said, 'I have come back by myself. The girl wished to go for half-an-hour's motor-drive alone in the Battlefield Park. . . . No, the Englishman was not with her. She may be going to meet him, but I do not think so. The whole thing seemed a sudden thought on her part. Can I do anything?'

'You will.' He smiled at her with his mirthless grin. 'This Seadon may be meeting her; but whether he is or isn't, I want you to go down to the lobby, watch for him coming in, and when he enters come up here as swiftly as you can and tell me. No, do not telephone up. Come yourself. I need you.' She made a step to go. 'When you join me in this room, don't be surprised at anything. When I say things to you, play up—play up; remember that.'

The woman Méduse left the room, and it seemed only a few minutes before she was back. Mr Neuburg came through the intercommunicating bathroom at the sound of the key in her door. He looked at her, indicating the necessity for quiet.

'He came in just as I reached the lobby,' she said. 'He did not see me. He came up straight to his room, I think.'

Mr Neuburg caught her by the wrist, and both very stealthily, and without the slightest noise, went back to his room. He led her close to the doors that communicated with Clement Seadon's bathroom. He paused, listened. He could hear no sound from the Englishman's side of the doors. He looked at her, grinned, and pointed to the floor near their feet.

On the floor was a yellow-painted lead pencil. It was lying alongside a white line Mr Neuburg had chalked on the floor. The woman Méduse stared down at it, wondering what on earth it all meant. And as she stared the pencil began to move.

There was no sound. The silence was poignantly profound. There was nothing to indicate a reason for the pencil's movement. And the pencil moved—slowly, silently, cautiously it moved away from the chalk-mark. It moved six inches, and then it stopped. Mr Neuburg looked into her face and grinned. His hand indicated the door leading to Clement Seadon's bathroom.

Then the woman, looking closer at the pencil, understood. Round the waist of the pencil was a thin line—a line of thread. The thread ran from the pencil under the closed door. Undoubtedly it was attached to the inner door of the pair by a piece of wax. She understood at once that the Englishman was in the bathroom. Thread and wax would be invisible in the dim light and in the almost imperceptible space between the double doors; but as Clement's door opened its movement would be shown by the movement of the pencil.

The pencil had moved. The Englishman had opened his door. He was at the opening of the door now, listening for what he might learn through the closed door of Mr Neuburg's room.

The woman Méduse in a flash understood how the Englishman had learnt the name of Joe, which he had used to get her away from Heloise

at lunch-time. Clement Seadon had overheard the conversation she had had with Mr Neuburg that morning. Mr Neuburg, in his brilliant manner, had solved that riddle.

Mr Neuburg, in his brilliant manner, was going to make the most of his knowledge. Very quietly he led the woman back to the door through which she had entered. He left her standing there with a soundless command of silence. He went to his chair and lowered himself softly into it. He picked up a newspaper and rustled it. He cleared his throat. He moved so that his chair would creak. He did this for a long ten minutes. Then abruptly he sprang up, making a definite noise, and moved towards her. 'Ah, you are back, my dear Méduse,' he said aloud. 'Where is the girl?'

Méduse played up—played up well.

'She wished to go for a drive alone in the Battlefield Park. No, the Englishman was not with her. She may be going to meet him, but I do not think so. The whole thing seemed a sudden thought on her part.'

'We cannot help it, anyhow,' said Mr Neuburg, smiling in his sinister manner. 'I do not think, on the whole, her seeing him will have much effect. I have good news—Siwash Mike has arrived.'

The companion Méduse was a little startled at that, but she played up. 'But—is that possible? You did not expect him for a day or two.'

'It is a fact. He has arrived, my mild Méduse. I had a telephone message from No. 7 Sault Algonquin this afternoon.'

He said 'No. 7 Sault Algonquin' precisely and clearly. He wanted the Englishman behind the door to hear it. Clement Seadon, behind the door, heard it, and chuckled silently. He was certainly having great good fortune. This was the second time in the day he had had the chance to overhear crucial conversations.

'Did—did Siwash say where he had found Henry Gunning? I suppose he has found him? That's what his coming here means?' The woman was not playing up so well. Mr Neuburg frowned bleakly; and yet, swiftly, he made her question serve his ends.

'Siwash knows better than to talk of matters like that over the telephone,' he said. 'I take it that he has discovered the lurking-place of our besotted friend Gunning. But I shall not know until to-night. I meet him at Algonquin at 10.30. He will report then.'

He said the last words very clearly. The Englishman was to hear them. Clement heard them, and congratulated himself. He was glad he had found out so much about the glue-maker's in Algonquin. If Siwash Mike was going to meet Mr Neuburg there at 10.30, talk to him about the whereabouts and the condition of Heloise's old sweetheart, Henry Gunning, then there should be much that would be worth hearing. He felt, indeed, that it was rather necessary that he should overhear. There was a pause in Mr Neuburg's room; then Clement heard the massive man speak again. 'What are you doing to-night—you and the girl?'

'O-oh,' said the woman, 'we are going to a concert of old *habitant* French songs. One of the ladies from the *Empress* told the girl she must not miss it for the world, so she booked seats. But if you wanted me at Algonquin, I could have a headache.'

'You will not have a headache,' said Mr Neuburg very distinctly. 'I do not want you at Algonquin. I want you by that girl's side. But—and attend to this carefully, my dear Méduse—if anything untoward occurs, you must come to the glue-maker's immediately. Understand that—you must come yourself. I will not have telephoning. I do not trust a woman on the telephone in so delicate a business as this. Follow carefully what I have to say. You may take a taxi, if you like, as far as the docks, but you *must not* take it into the Sault Algonquin, or to the door of No. 7. You understand? No curiosity, particularly that of the glue-maker's neighbours, must be aroused. For that reason you will not knock at the door, which, you know, is in a cart gate, or wait about outside. *All you need do is to push against the little door in the gate. It will be open. It will purposely be left open.* Now you understand that perfectly?'

The woman understood that perfectly. She repeated the directions to show that she had it perfectly. Mr Neuburg said, 'That is good. I do not think anything untoward will occur, but we must always plan for any event. And now that you know everything, you had better go back to your room and await the girl. We cannot risk suspicion of any sort. Let us hope that Siwash will bring us definite and good news of Henry Gunning, and that what I hear at 10.30 to-night may mean a speedy finish to our big scheme.'

Clement echoed the sentiments. He hoped—in fact, he felt certain—that what Siwash Mike would have to say about the vanished Henry Gunning would give him (Seadon) facts which, in addition to the other damning material he had, would enable him to settle the accounts of these rogues swiftly and for all time when he spoke of them in his talk with Heloise Reys to-morrow morning.

He felt, indeed, that it was all part of fate working on his side. Siwash Mike could not have come to Quebec on a more fortunate day. If he had come to-morrow, convincing though the facts were that would be put before Heloise Reys in the morning, they might have lacked full conviction; whereas Clement now hoped to get material this very night that would make the case against the rogues an absolutely shattering one.

Siwash Mike's coming fitted into the situation as neatly as if it had all been thought out. Clement thought it might have been thought out, ordained, by Providence.

And not only had good fortune sent along Siwash Mike to-day, but good fortune had also stepped in to enable him to make the most of Siwash Mike. To be present when that rogue reported to his master was not going to be child's-play, but it was going to be simpler than he had first thought. The way down the cliffside to the glue-maker's of Algonquin was a certain way in, but it would be difficult and dangerous in the dark. Now, thanks to his abounding good luck, he had overheard that all he had to do was *to push against the little door in the big cart gate of the glue-maker's, and it would be open.* Good fortune had favoured him with an easy entrance. How could he reject this offer of good fortune? He could not.

And Mr Neuburg, as he sat in his own room and smoked, thought much the same thoughts. How could this Englishman reject this offer which good fortune apparently had offered him? No, the fellow could not—and he would not. He would go to the glue-maker's of the Sault Algonquin at 10.30 to-night.

And Clement Seadon went.

He put on old clothes. He carried an automatic pistol in his pocket, and a very heavy and stout stick in his hand. He also wore rubber-soled brown shoes. His adventure was not going to be easy and without danger, and he was prepared for all eventualities. But, on the whole, his great good luck had given him an exhilarating sense of confidence, and as he passed through the dark streets of the lower town of Quebec, and into the canyon of lowering and silent blackness that night made of the Sault Algonquin, he felt sure of his success.

There was no one about. He reached the glue-maker's unobserved. The face of the house was black, enigmatic. There was no sign of life or light. He pressed upon the little door in the big cart gate. Yes, it was yielding—it was open. With a sharp movement he opened it wide enough to let his body through, slipped inside.

Under the arch of the house the cartway was a cave of almost impenetrable blackness. Moving very slowly and very silently, Clement stole to the left. The door of the house must be there. He felt along the house wall. There was no window. For yards there was nothing. Then his hand dropped into the recess of the door, slid across the woodwork, found the handle. Softly, gently, he turned. The door answered under pressure; it opened. Clement was inside a pitch-black room.

There was just a faint sound; something small fell—something as small as a pencil. Only in that terrific silence would he have heard so small a sound. Then complete silence—silence bearing down like a shroud. Slowly, cautiously, Clement closed the door behind him—took one, then another, then another step into the room. Something tautened and snapped across his instep—a thread. He half-lifted his stick.

A hoarse whisper—a sudden rush of movement. A torch clicked, wavered, struck into his eyes with its brilliant and dazzling light. There was a sweep of movement. Men—men—men bore down on him in a terrific rush.

(*Continued on page 215.*)

SANCTUARY: THE HISTORY OF ALSATIA.

IN the year 1241 Henry III. granted to Sir Richard Gray, first Prior of the Carmelite Monks or White Friars, a plot of ground lying to the south of the site now occupied by Fleet Street, whereon to build a monastery, to which was attached the right of sanctuary. To this privilege may be said to belong the history of Alsatia.

The better to understand the exact meaning of the term sanctuary, it will be necessary to glance briefly at the laws which governed England at the period in which the right was granted. There were then in existence two modes of legislature, one administered by the Church, and the other by the State. Among the laws relating to the Church was that of sanctuary. This measure provided that persons guilty of any crime were immune from the law of the State should they succeed in gaining the precincts or sanctuary of the Church. The privilege will be better understood when it is stated that a criminal could be arrested by the law of the State outside the boundary of sanctuary; but once inside the boundary-line of the monastery grounds, he could not be molested. Here he was in Church territory, and was consequently outside the jurisdiction of the State. How this right was abused will presently be seen.

In the fourteenth century London was visited by the great plague, Black Death, which was then devastating Europe. The city was almost entirely depopulated, the mortality among the monks being particularly heavy. The small number who survived its ravages were now no longer able to preside over the immense grounds which surrounded the monastery, and they accordingly sold them for building purposes. In a short time, therefore, there sprang up in the grounds of the monastery a number of elabo-

rately built houses, which were occupied by the nobility and wealthy merchants. For over one hundred and fifty years this district, which was known as Whitefriars, maintained all the dignities then attached to a fashionable residential locality; but London was rapidly extending, and soon warehouses and shops began to flourish in close proximity to the mansions of the wealthy citizens, who thereupon abandoned their houses for more secluded quarters. Whitefriars then began to degenerate, until in the reign of James I. it consisted of a heap of wretched tumble-down mansions. The monks, of course, had long since been swept away by the Reformation, but the privilege of sanctuary still remained to the locality. After the Reformation the privilege was vested in the inhabitants of the district, who elected yearly a bailiff to exercise the functions formerly performed by the monks. The holders of this office were open to bribes, and the place soon became a veritable den of iniquity, infested with highwaymen, pirates, assassins, and almost every known class of criminal. Alsace-Lorraine was then, as at the present day, a bone of contention between France and the German States. The constant struggle for it by the rival countries left it practically without laws, and from its resemblance to this district Whitefriars now became known by the cant name of Alsatia.

The Sanctuary of Whitefriars was situated at a considerable distance below the terraces and gardens of the Thames. For this reason it was frequently enveloped in the dense fogs and mists which rose from the river. The buildings of which it was composed were naturally packed closely together, for in a place possessing such strange privileges space was of considerable value. Here every second house was a tavern or inn, and each inn had its particular customers, who ate, drank, fought, and not infrequently murdered each other just as their humour suited. The kingdom of Alsatia was presided over by a council of six, who were elected by a majority of its inhabitants. This governing body sat at regular intervals for the purpose of considering applications for admission to their territory. A 'king' was elected each year, and each member of the council became monarch in turn, so that the monarchial line of Alsatia was incongruous to a degree. One year the 'king' was some rascally lawyer, and the next would see in the chair of state some swashbuckler who had killed as many men as he possessed fingers and toes. To gain sanctuary was not a difficult matter. Any one requiring it was promptly brought before the council, and on divulging his crime he was called upon to pay two nobles, this being the admission fee. In many cases, however, where the applicant did not care to disclose his offence, the payment of five or six nobles was taken in lieu of his confession, and he was admitted. When these monetary considerations were arranged, he was called upon to take the oath of allegiance upon the Grand Register of Alsatia. This was a huge book heavily ornamented with silver, and was probably a tome belonging to the monks, who very likely used it for the registration of the names of the members of the community.

It must not, however, be thought that all who craved sanctuary were criminals. Large numbers of persons who were falsely accused of crime hurried to Whitefriars, where they received that protection which their innocence could not obtain for them outside. In those days of intolerance, too, many a poor wretch whose religion was his only crime had to thank the Alsatians for his life. But in general the character of those who resorted to the sanctuary was of the same uniformly low level. Here it was that Colonel Blood hatched his plot to hang the Duke of Ormonde, and his still more desperate plan to steal the Crown-jewels. Here, too, resided for a time Henry Morgan, the buccaneer; while it was the favourite resort of Avery, the famous pirate. Claude Duval, the highwayman, and Titus Oates, the perjurer, were amongst other notable characters to whom the sanctuary afforded refuge, and they were a fair index of its everyday population, which was composed of every species of criminal—bravoes or professional murderers, ruined gamblers, absconding bankrupts, unfrocked clergymen, broken captains, and attorneys who had been struck off the rolls. These, and hundreds of like characters whose existence was inevitable in a city with a population of half-a-million, formed the *élite* or aristocracy of Whitefriars, the rabble being composed of such meaner criminals as housebreakers, pickpockets, and footpads.

The death-blow was struck at Alsatia by Shadwell's celebrated work, *The Squire of Alsatia*. Public attention was first roused by the notorious characters which he adopted as the *dramatis personæ* in the play, and later the Government was forced to take action by having Shadwell's words brought under its notice. In the play one of his characters exclaims, 'Was ever such impudence suffered on a Government? Ireland conquered, Wales subdued, Scotland united—but there are some spots in London just in the face of the Government unconquered yet—that hold in rebellion still. Methinks 'tis strange that places so near the King's Palace should be no part of his dominions. 'Tis a shame in the society of law to countenance such practices. Should any place be shut against the King's Writ or *posse comitatus*?'

In 1697 a special Act of Parliament removed for ever the privilege of sanctuary from Whitefriars, and thus a spot which long cloaked iniquities of the vilest type, and sheltered criminals from the results of their misdeeds, ceased to exist, and rapidly died out of memory.

THE FELINE WAY.

PART II.

IV.

I FANCY he cherished a grudge against the evil little spotted beast that had caused all the trouble. Certainly she was no specimen of a she-leopard for any such as he to risk his handsome pelt over; yet not three hours had crept past, and the lions had not finished their evening concert of thunder among the hills before starting on their rounds, when Idzimba was back in the palm-belt by the river again, hunting for the trail of the she-leopard and—the other.

He found where both beasts had leapt from the baobab, separately, for their lives; found, too, where they had come together later; traced where they had at first left, then returned to, and crept actually three times round the village; and finally came upon them trying to effect an entrance *through*, not over, the ten-foot stockade of thorns that protected the village from the outside.

It was M'balana who, in an interval of moonless blackness, managed to wriggle, with many half-smothered feline remarks concerning the thorns, half-way through the wall. But it was the little female beast who, in her ravenous temper, mercilessly clawed him aside, and nearly completed the entrance, before she stuck fast, and seemed in danger of going silently mad in her eel-like wrigglings. Finally, it was Idzimba himself who, with reckless claw, scraped her a way free by which all three beasts at last entered.

They found themselves within an outer circle of bee-hive huts, fires that had died to red glimmers, and—a 'niff,' if I may thus gently put it. The dark was full of snoring savages all about them. Beyond was a low reed-wall, and they reached it, snake-fashion, flat to the ground, rippling, on their bellies. And within that wall, forming the centre of the village, were the flocks and the herds there gathered.

Three soft thuds announced the arrival of the leopards among these beasts. There was a second's pregnant pause, and then the madness of the little demon she-leopard took her. It was an extraordinary phenomenon.

She leapt at the throat of a goat, wrenched it down, and, before its life had flitted, rebounded upon another. From this victim, kicking with a severed spine, she flashed to a third, tore open the jugular of a fourth, and repeated the manœuvre.

But that was not all. Excited, it may be—for leopards are the most excitable members of a most excitable race—by the actions of the adored feminine, or by the smell of blood, or the chance to kill so much so easily in such a confined place, or by all three, both male leopards went apparently mad together also—Berserk, crazy, *must*, call it what you will.

I cannot pretend to tell you what they did actually, because I do not know. Besides, it was not nice. All I can say is that they shot from place to place, from beast to beast, with unbelievable speed, almost like demon birds, and that wherever they passed they left a dead or dying goat or sheep behind them. It really was a most diabolical killing, and in three minutes the place was a reeking shambles, no less.

Then that village awoke to the accompaniment of hoarse yells, racing figures, dancing firebrands, spear-blade flashes, and the voice of one—probably the chief—shouting in stentorian tones, 'You think it is a hyæna or some such a one, but I tell you it is no small beast.'

For one boiling minute of chaotic inferno the three leopards streaked about the enclosure clawing, biting, tearing, almost too quickly for eye to follow—oblivious to spears, fire, risk, noise, and all else.

Then, in a breath—they were gone, leaping the outer ten-foot stockade effortlessly, with inches to spare, in their stride, and flying, each male leopard taking a goat with him! It was a surprising feat, the more so because they had made such a surpassing bother of it in getting in.

Only the female went out by the way she had come, as if, for some reason, unable to jump. *But*, before she left, like lightning she had charged and clawed three men, one after the other, ere making her escape.

And it was that act that did it really, for it is written in the Laws of the Wild that whosoever attacks man becomes an outcast, banned utterly, and—dies. There is no appeal when Nature speaks from the Chair of Justice; only death, sooner, it may be, or later, but death certainly, sure, relentless, and probably painful.

V.

Dawn, 'rose and saffron, robed and splendid,' found Idzimba 'moulded' along a mighty limb of a giant fig-tree. He had not got over the madness of the night; there was still a red tinge back of the green light of his cat's-eyes, a restless twitch to the last two inches of his tail. He looked, and was, unsafe to approach yet. Whether he knew that the small female leopard was also alone—in thick forest—that, in fact, both males had left her, a little awed, perhaps, if not almost disgusted, at the risks she ran them into, or tired of her heartless ferocity, I cannot guess. The ways of the cats are strange, and mystery enshrouds them all.

Only this I know: by sunset both male leopards were back again; had met—and snarled

—following up her track, seeking her favour, submissive beneath her cuffs—for claws and fangs were all they got from *her*.

And now, as she saw them together, gliding snakily through the dappled sun and shadow under the plaque-like acacias, we, who are privileged to watch them, may note an extraordinary difference between Idzimba and the other two.

Whereas *they* possessed the yellowish-rufous-fawn of all leopards, punctuated with black spots set in the form of rosettes, and fading to white on the under parts, Idzimba's coat was a rich orange, and the spots, quite solid and nowhere forming rosettes, ran together, as it were, from head to tail in a wide zone, giving to the beast at a little distance the appearance of being, though he was not really quite, black. Other differences revealed themselves also. The other male leopard, short-coated, long, low, snaky, almost exactly eight feet from tip of nose to black tail-tip, weight one hundred and twenty pounds, was as perfect a specimen of the typical leopard of the plains as could be found. Idzimba, taller, more leggy, much longer in the coat, more ruffed, measuring perhaps seven feet nine or ten inches, but turning the scale at a hundred and thirty pounds, was, except for his rare pelt, an equally typical and fine specimen of the leopard of the hills.

The trail of the little female leopard led to trouble, as usual. Unable, or loath, for some reason, herself to make the 'kill,' she induced her admirers to drop from an overhanging branch upon the shoulders of two Grant's gazelles fleeing through the night as from some doom unspeakable. It was only when they had got their prey to earth that they discovered the gazelles were being hunted by a pack of those hyæna-like wild dogs that are at once the terror and the curse of the wild life of Africa. Thereafter things happened, and the two leopards, fairly exploding snarls and curses, leaping here and everywhere like jumping fireworks of mammoth proportions, and most horribly annoyed to boot, succeeded in reaching a tree—any tree—alive, if not undamaged.

And after that the leopards had the pleasure of watching the gazelles dissolve down the throats of the ravening pack as sugar dissolves in a glass of—hot water.

Then for two hours the pack lay about in the tinder-dry grass resting, or from time to time gathering like gibbering gnomes at the foot of the mimosa-trees that held the leopards. Finally a tropical thunder-storm, that tore the heavens with sheets of flame, and the hot earth with gushing channels of water, drove the wild dogs into the night, and the leopards into a fit of soaked sulks.

VI.

By the time that all had cleared up again and a tall moon rode aloofly across the sky, M'balana and Idzimba discovered that the female leopard had discreetly vanished. There was nothing for it but slowly and painfully to trail her; but since they could not agree within yards of each other, that trailing developed into a running fight.

First, they found where she had waited with wonderful feline patience for a *rat*, if you please, to come out of its hole—what proud prey for the proud leopard!—but it was a mamba snake, eight feet long, that came out at *them* instead, and sent them flying. Next, her tracks took them to the freshly slain carcass of a zebra; but it was a lion, not she, who had done the slaying, and he did his kingly best to slay them, in addition, for meddling.

Skirting a plain that lay like a lake of silver in the cheating moonlight, the way took them to a goat tethered under a tree, who appeared harmless enough till just as M'balana was about to spring upon it, Idzimba, with a growl, discovered the crouched form of an armed hunter on a platform in the juniper-tree above.

From the goat the scent took them through dense thorns, where, by the smell, not less than the entire male population of the Masai village had been looking for them during the day. From this place they removed, with snarls, and belly-flat, to the village itself!—nay, more, to a gun set across the path, and a lump of meat tied on to the muzzle thereof. This thing, by some miracle, barely missed blowing M'balana's head off when, rather vaingloriously—he would have investigated it for hours before he touched it, ordinarily—he essayed to seize the meat. And—*and*, mark you, Idzimba, leaping back at the enormity of the explosion bursting asunder the brooding silence of the night, touched off another gun, the string attached to the trigger of which was stretched, just at the height of his chest, across the native path. Only the matter of a little rust on the trigger of the weapon, which delayed discharge for perhaps the half of a second, saved his life. But, of course, he was not to know that, and the two leopards made off for a quarter of a mile without stopping—their love could go hang—while the awakened village boiled like an overturned bee-hive behind them.

Then it was that Fate got in on her fine work. Suddenly the uproar in the village way back in the night was cut asunder by the thick, choked, damp report of a black-powder musket—by, in fact, such an old weapon as they use for trap-guns—and, following this, one brief hush; a single, short, sharp, coughing roar; a yell, a scream of agony and fear, and then pandemonium.

Then—they were downwind, remember—the two listening leopards stopped, and returned silent as sleep, flattened, and with that concentrated caution that had earned for them from the natives the name of 'the father of cunning.' It had taken them three minutes to remove

from that native village. It took them three hours to return to it—never placing one paw forward till eyes, and ears, and nose, *and* whiskers, *and eyebrows* said the position was safe. And *this* time no trap-gun, or trap of any kind, would have tricked them, nor any eye or ear have discovered or suspected their approach.

They were following something upwind, and it drew them as if by ropes—the scent of the female leopard.

There she lay full in the middle of a circle of red light from the leaping fires that seemed to spit and hiss at her like vengeful snakes. She was quite silent, and very still, and about as full of spears—venomous Masai spears, two feet long in the blade—as a porcupine is full of quills; and her ruffled coat was as red as the dawn of a stormy day.

Both male leopards made a funny little moaning noise, very softly indeed, as they saw her from afar, for *she* was dead, as dead as the warrior she had charged and killed when the trap-gun went off and wounded her—charged, because a wounded leopard always does charge till it kills, or is killed; charged till the Elmoran, closing in upon her on all sides, stabbed her to death.

But it was not the spears that had killed her really, nor her wound from the trap-gun either. Upon her back, almost between the shoulders, the flickering light of the flames revealed, to such as cared to look, the unhealed scar of a bullet-wound *five months old*. It was that—that pain—which had made her do what she had done; made her thin and unable to hunt; made her fall foul of man, and attack his herds and flocks, and finally man himself; had made her break, too, the Law; had turned her into a living fiend incarnate; had, in the end, sent her to her doom.

Next dawning the baboons knew that Idzimba was back in the cave on the *kopje*, and those 'spirits of the rocky heights,' the mountain reedbuck and the klipspringer antelopes, were signalling with whistling snorts all down the slopes that peace reigned there no more.

THE END.

LOST TREASURES OF CANADA.

CANADA, though comparatively young among the nations, has her genuine stories of buried treasures, stories that stir the imagination and draw heightened interest. Of them all, those concerned with the *Primrose* privateer, with the Rock of Percé, and Montcalm's treasury are matters of historic fact.

Few Frenchmen during the reign of Louis XV. made a greater use of privateering to get wealth than Dupleix, the governor of Pondicherry. Availing himself of his authority, he issued papers to a large number of ships to prey on British commerce. In a few years they returned him so great an amount of treasure that he feared to send more of it direct to France lest Louis laid hands upon it in his anger, for the governor's privateers had captured and looted vessels other than those of the enemy. He bethought himself, therefore, of Canada. Here he had a younger brother in an official position in Quebec, who could hold the ill-gotten gains till the governor of Pondicherry had resigned, and returning to France a poor but 'honest' man, could emigrate to Canada to find his fortune, as Frenchmen did in those days. It was a country believed in France to be a place where any man not a fool might become rich speedily. Dupleix realised that if he spent six months there, no suspicions would be aroused by his riches on his return to France.

He carefully fitted out one of his largest privateers, the *Primrose*, said to have been captured from the British merchants, and sent her with a cargo of merchandise, in which was concealed a great part of his treasure, to the far-distant port of Quebec. She made the Gulf of St Lawrence safely in 1759, and her captain was told by the fishermen of the fall of Quebec one month previously, and of the neighbourhood of British men-of-war. He was short of stores and water; so, having taken on board a fisherman-pilot, he stood away for the Bay of Islands, at the mouth of the St Lawrence, where he trusted to get the necessaries from the French settlers.

During the evening a heavy gale came down, and drove the ship on the reefs inside the bay. Here she sank in comparatively shallow soundings, and three survivors managed to reach the shore. To-day two old wrecks are known to be there, and are marked on the charts. One of them is the *Primrose*, with her great store of Dupleix's gold and silver, precious stones, and other valuables. The fishermen of the Bay of Islands have their traditions about the *Primrose*. With modern diving methods it should be possible to salve this wreck of a hundred and fifty years or so ago.

Before the attack on Quebec in 1759, the French seigneurs sent up to the citadel there, which was supposed to be impregnable, their family jewels, heirlooms, and other valuables, together with great sums of money in louis-d'ors, gold doubloons, and other coins; and these were put in the strong-rooms of the military treasury, with, as well, a large sum newly arrived from France. When an attack on the citadel became certain, Montcalm directed the treasures to be bound up in skins, placed in barrels and boxes, and taken in boats up the St Charles River near by, and buried until the danger was past. That

this was done is proved by the fact that the strong-rooms of the citadel were empty when Quebec was captured. Much cogitation ensued over this; but all traces of the removal were lost.

Now, in the spring of 1908 the proprietor of an eighteenth-century château not far from Quebec took it into his head to rebuild an old-fashioned fireplace in the house. Behind the back of the fireplace a small cavity was discovered, and in it a little silver-bound box of eighteenth-century make. On its being opened, a small parchment, aged-stained and brittle with the heat of the fires, was found, on which, written in the unmistakable French script of Louis XV.'s time, were certain directions.

The *habitant*, who was aware of the tradition of the removal of Montcalm's treasury, took counsel of his priest. Next day the two went to work, as the parchment directed, at the 'little bay on River Saint Charles.' After much trouble in agreeing on the likely spot, 'ten feet up the east bank,' and in the measurements, 'five feet deep in the earth,' they commenced to dig. Some feet from the surface they came upon the items enumerated in the parchment, 'plaster, burnt wood,' and found there the 'plate and ingot of silver, and the skull of a sheep.' 'Beneath is the secret of a great treasure,' ended the parchment's information; and there, beneath, lay a little, rusty, iron-bound box. They burst it open.

The box contained a very rough chart—the ink of it much faded—and information written in French of the time of Montcalm. It read: 'Across River Saint Charles to the wood near the small bay and peninsula. Twenty feet NNW. by N. toward the group of firs. Fifty feet as the sun sets. Five feet deep and set in plaster the great treasure from the Citadel. God save us all.'

The two treasure-seekers pondered over the chart and directions for some days, then went to work. As, however, the land in question now belongs to the Roman Catholic Church, they had to do it secretly and in the dark. After much searching around and much calculation, they began to dig. They dug in vain. For, though the documents are to be relied upon, that little peninsula of the Saint Charles has not remained the same throughout the one hundred and fifty odd years since the treasure was buried. There have been many a heavy flood and many a severe winter and many a gale. The group of firs is gone. Nature has sealed up the exact spot of the long-concealed treasures of Old Quebec. Yet—they are there.

Full of wild romance is the tale of 'Devil Duval's' hoard on the Rock of Percé; and full of wild daring are the tales told of those who attempted afterwards to climb up and recover his treasure. So many lives were lost that early in last century an Act was passed in the Quebec legislature forbidding any one to make the attempt without authorisation from the governor of the province. To this day the superstitious French-Canadian fishermen, unchanged in a hundred and forty years, declare the fierce spirit of the seaman protects his own.

The Rock of Percé, named from the fishing-hamlet at hand on the coast of the Gaspé Peninsula, is one of the natural wonders of the North American Continent. Some terrific convulsion tore this rock from the near-by mountain many thousands of years ago, and left it standing about five hundred feet high, with a flattish top and beetling, unscalable sides. Once it was pierced by two caverns at its sea-foot, through either of which a boat could sail; but one of them has collapsed, leaving only the greater, through which the sea thunders and boils in stormy weather.

Captain Duval was a French privateer, who, after the Peace of Paris, February 1763, became a most daring pirate, on whose head the British authorities put a tall price. He, however, through his protection of, and generosity to, the French fishermen and settlers on the Atlantic seaboard, was kept well aware of the movements of the British against him. At last he was hard pressed, and likely to be captured; and having in his service a Micmac Indian, who was devoted to him, and was aware of a secret trail to the summit of the supposed inaccessible Rock of Percé, Duval collected all his caches of treasure and set sail for Percé. The Micmac is said to have wormed his way to the top of the rock by means of an opening from the greater of the caverns. On arriving on the summit, he threw down a thin line, and with it hauled up a block and fall. Two prisoners were pulled up by him, and then came the captain himself. Boats containing the treasure in chests stood by below.

Tradition runs on that they were a day and a moonlight night getting it all up. Then the Indian came down, and Duval himself was lowered away. His sword was all bloody. With muskets he himself and his few trusted seamen shot at the tackle till it was cut through, too high up the rock for any one to reach. Then Captain Duval pulled for the ship and sailed away. He never returned, nor did any of his trusted men. Either the hurricane that burst that same night sent his vessel to the bottom, or she was sunk by the British men-of-war looking for her.

For a couple of generations the winds battered and the rains rotted the stout hemp ropes on the side of the rock till at last they disappeared. Though there are fishermen in Percé whose grandfathers could recollect seeing these evidences of Duval's visit, none but the sea-birds that nest on the rock know what happened to the two English prisoners and the chests of treasure left on the bleak summit. But—some daring airman may one day find his fortune lying waiting for him there.

THE MONTH: SCIENCE AND ARTS.

A PETROL-ECONOMISER FOR CARS.

THE function of a carburetter on a motor-car is to mix air and petrol-vapour in such proportions that the most economical and effective results are obtained under all circumstances. The problem is, however, a difficult one, as is evidenced by the large number of carburetters on the market, each claiming to give a perfect mixture. As a matter of fact, no carburetter gives the most economical and effective results at all speeds and with all loads. In order to improve matters in this direction a device has been brought out through which air is admitted into the induction-pipe under certain conditions. It consists of a spring-controlled air-valve which is fitted just above the throttle. When the car is climbing a hill, with the throttle fully open, the suction is not powerful enough to open the air-valve. But when the motor is throttled down for descending a hill, a partial vacuum is created in the induction-pipe, and air is drawn in. The effect of the extra air is to reduce the suction at the throttle, and consequently the amount of petrol consumed. At trials made by the British Motor Cab Company, of London, the mileage per gallon of a 4-cylinder Renault car was increased from 16 to 18 in one case, and from 19 to 23 in another. The effect upon a 4-cylinder Charron car was to increase the mileage from 18½ to 23 and from 18½ to 24½ respectively during two trials. Similar trials of Thorneycroft and Daimler lorries on heavy roads in France showed a saving of 14·42 per cent.

SCRUBBING A SHIP'S BOTTOM AFLOAT.

As will be known to most of our readers, barnacles and vegetable growths attach themselves to ships' bottoms both during voyages and when in port. These growths take place very rapidly in the tropics, and it has been necessary hitherto to scrub them off frequently. For this operation a vessel has to be floated into a dry dock and the water pumped out. These frequent scrubbings form a very big item in the working cost of all ships sailing through tropical waters, as not only are the dock charges heavy, but the loss of time when the vessel could be carrying freight is a very serious item. Moreover, in many ports dry-docking facilities do not exist; consequently a vessel arriving in a foul condition has to proceed to another port without any cargo for the purpose of being scrubbed. These disadvantages have been obviated by an ingenious appliance which is capable of scrubbing a vessel when afloat. It consists of a revolving brush, five feet in length, which is driven by a submersible electric motor. The motor is fitted at right angles to the brush, and at an angle of about forty-five degrees below the horizontal. It drives a shaft parallel with that of the brush through worm-gear, the brush being driven at each end of this shaft by chains. At the back of the motor is a screw propeller, which forces the brush against the vessel's bottom. The apparatus is carried in a special steel motor-boat, forty-five feet in length, which is fitted with a powerful oil-engine and a dynamo for supplying current to the brush-motor. This oil-engine is also used to drive a propeller, which gives the boat a speed of nine miles an hour. The scrubbing-gear is suspended from two booms projecting at one side of the motor-boat. Owing to the direction of rotation of the brush, it tends to pull itself down under the ship's bottom. It is allowed to scrub down to the keel, and is then hauled slowly back by an electrically driven winch, after having cleaned a band five feet wide. The motor-boat is then moved four feet forward or backward, and the process repeated until the whole of the bottom has been cleaned. The revolving brushes are made of fibre of varying degrees of stiffness, and they can be quickly changed when necessary. The apparatus is capable of cleaning an 8000-ton steamer in about eight hours, and the work can be done while the vessel is loading or unloading or waiting for orders, so that no delay is involved.

A NEW SPARKING-PLUG.

Every owner of a car is familiar with the effects of over-lubrication in covering with soot the sparking-plugs, with the result that the motor misfires and stops, and cannot be restarted until the insulating material and the points are cleaned. A new sparking-plug has been placed on the market, which is unaffected by oil even in large quantities. It is constructed with two chambers. The outer chamber intercepts the oil, soot, and gases before they come in contact with the insulator. The soot and oil are deposited on the walls of this chamber and are consumed by the hot gases. The temperature of the exploding gases is considerably reduced before they enter the inner chamber, in which is housed the insulator. Practically no combustion takes place at this point, thus keeping the insulator cool and free from carbonised oil and soot. The method of fitting the insulator is unique, it being held within the gland-nut, together with the joint washer. This unit can be instantly removed in one piece for inspection.

PURE DRINKING-WATER FOR THE ARMY.

Among the many difficult problems arising out of the war was the sterilisation of drinking-water for the troops in the field without introducing into it any appreciable taste. This was successfully accomplished by diffusing chlorine

gas through the water, and afterwards treating it with sulphur-dioxide to remove the taste of the chlorine. The apparatus adopted was worked out by Messrs Wallace & Tiernan, of New York, from a patent taken out in 1912 by Major Darnell, of the United States Army. After passing through a compensator, which equalises the pressure, the gas is metered, and then forced into the water through a diffuser, which breaks it up into very small bubbles. Subsequently the sulphur-dioxide gas is introduced to remove the taste of the chlorine. For troops on the move, portable plants built on motor-lorries or larger forms of the same apparatus carried on barges were used. For town water-supplies and big quantities for large numbers of men, a stationary plant was employed. A small amount of chlorine was purposely left in the water, but this mostly disappeared before use and no unpleasant taste could be detected.

A QUICK TIRE-CHANGING DEVICE.

The forcing of a heavy motor-tire into place with levers is often a long and arduous task—so much so that most car-owners prefer to carry a complete spare wheel instead of merely a spare tire. The quick and easy fitting of a tire to a wheel without removing it from the car can now, however, be effected by a detachable rim at one side of the wheel. This rim is bolted to the wheel, but about two-thirds of it is hinged to the remaining portion. When a new tire is to be put on, the nuts holding the hinged portion in position are taken off, and this part of the rim is turned back. The tire can now be put over without any forcing with levers, and the rim turned back into position on its hinges, the nuts being put on to the bolts again and screwed up. At a recent demonstration before a number of editors of motor papers, the inventor took off a large tire in nine seconds, and *kicked* it on again, without touching it with his hands, in eleven seconds.

A HOME GRAMOPHONE RECORDER.

Many persons in possession of gramophones must have wished at some time or other to make their own records. But until recently this could only be done by costly and cumbersome apparatus, involving also the use of a special machine. The necessary fittings for making records with an ordinary gramophone can now, however, be purchased at a comparatively low price. Naturally, when a record has to be cut upon a polished wax disc, the needle must be guided; and this is effected by a tracking-plate, which is placed upon the turn-table of the machine in the same way as an ordinary record is put on. The centre portion of this plate, which corresponds with the blank part of a record, has a fine spiral groove cut upon it. This portion is also slightly raised, and has an excrescence on the edge that fits into an indentation in the wax blank which is placed over the plate when a record is to be made. The recording attachment fits into the tone-arm of the gramophone in place of the ordinary sound-box. When a record is taken, the singer or speaker stands as near as possible to the front of the instrument, and articulates in a loud, clear, and distinct manner. At the beginning of the record a fibre-needle rests on the outside groove of the spiral track, the needle gradually working up to the centre of the plate and guiding the recording attachment. The actual recorder is fitted into a socket in the attachment, and a small recording-horn is fixed at the rear. The record is cut by a sapphire needle, which begins at the outside of the wax blank and is guided inwards by the fibre-needle resting on the tracking-plate. The record can be reproduced by substituting the reproducer for the recorder, and moving over the tone-arm until the fibre-needle is again in its first position in the outside groove of the track. Records made with this attachment can be retained and played over as often as is desired, or they may be cleaned off and the blanks used over and over again. The apparatus is made in England, and fits any machine.

VARYING THE EXPRESSION OF A GRAMOPHONE.

A device has been recently brought out which enables the operator to vary at will the expression of a piece of music rendered by a gramophone. It consists of three small studs which make contact with the sound-disc, these being pressed against the disc with more or less force, as desired, by a lever working on a fulcrum at the edge of the sound-box. Under the other end of the lever is a rubber ball connected by tubing to a second ball, which is held in the hand of the operator. By varying the pressure on this ball, the air in the ball under the lever is compressed to a greater or less extent as deemed desirable, this pressure being in turn transmitted to the three studs resting upon the sound-disc. A clip holds the device at the edge of the sound-box. A complete sound-box is also sold, with the expression device as an integral part of it. The makers claim that the device not only fulfils its primary function of modifying the expression, but also eliminates the objectionable blast and surface scratch which are so often present while a record is being played.

A HOME PRINTING-OUTFIT.

A considerable saving in money and in time could frequently be effected by printing notices and circulars at home or in the office. Special outfits at low prices are now available for this purpose. They are made in three sizes to print sheets $7\frac{1}{2}$ inches by 5 inches, $8\frac{1}{2}$ inches by $5\frac{1}{2}$ inches, and $10\frac{1}{2}$ inches by $8\frac{1}{2}$ inches respectively.

Each consists of a lever printing-press, with all the necessary accessories, including a fount of type, a type-case, a composing-stick, a chase to hold the type when set, and an inking-roller and a supply of ink.

A HOME WASHING-MACHINE DRIVEN FROM THE WATER-TAP.

In these days every one is more or less familiar with washing-machines intended for use in the home; but a washer which we have recently examined possesses distinctly novel features. Instead of being worked by hand or by electricity, it is driven by the flow of water from an ordinary household tap which gives the requisite pressure. The washer itself consists of a round hard-wood tub, with smoothly fluted or corrugated sides and bottom, mounted at a convenient height on three legs. Attached to the top of the tub is a small motor of simple design, which can be readily connected to the water-tap by means of a hose-pipe especially adapted for the purpose. To begin operations, the tub is three-fourths filled with boiling water and the necessary soap, the dirty clothes are dropped in, and on top of them is placed the 'washing-disc,' which is smoothly ribbed on its under surface, and rests upon the clothes very lightly. The lid having been fastened down, and the hose-pipe connected with the tap, the water is turned on, and runs down the pipe to the motor, which contains a simple two-way valve, allowing the current to enter at one side and go out at the other. In its passage, however, the water does very useful work, causing the washing-disc, which is connected up with the motor, to make alternate half-revolutions to right and left, thus forcing the soap-laden water through the dirty clothes, and effectively cleansing them without injuring them, a process which is complete in about eight or ten minutes. During this time about twenty gallons of water have flowed through the motor, from which it is conducted by means of a second length of hose. Still fit for further use, it may, if desired, be discharged into a tub instead of being allowed to run to waste down the sink. This machine has been found to be particularly serviceable for blankets and woollen goods generally. Its capacity is four sheets or their equivalent; and naturally much hotter water can be used than if the washing were done by hand. The same supply of boiling water, it has been found, serves for three sets of clothes; a batch of white things, for example, may advantageously be followed by a number of woollen goods, and these in turn by dusters or towels. A suitable ledge for the attachment of a wringer is fitted on every machine.

A BOON TO THE ONE-ARMED.

Probably under no circumstances does the one-armed man feel at so great a disadvantage as when, seated at the dinner-table in the company of other diners, he is unable to manipulate a knife and a fork in the customary manner. To minimise his difficulties, a combined knife and fork which appears likely to prove serviceable has recently been placed on the market. The handle is of the usual shape, but the blade, instead of being straight, is curved, and somewhat exceeds an ordinary table-knife in breadth. The central part of the convex side of this curved blade forms a keen cutting edge by means of which food can be cut up; at the end remote from the handle the blade is so subdivided as to become a short-pronged fork, with which suitable portions of food may be carried to the mouth.

A PUBLISHING CENTENARY.

We desire to extend to our contemporaries, Messrs Charles Griffin & Co., Ltd., our heartiest congratulations on the completion of one hundred years of successful publishing. Founded in Glasgow in the year 1820, the business was in 1848 removed to London, where the firm speedily made for itself a reputation for the excellence of its technical and scientific text-books—a reputation which has steadily grown with the growth of the years. To mark so notable an occurrence as the celebration of its centenary, the firm has issued a handsomely appointed volume, setting forth, with quite unusual literary skill, the history of the achievements of this well-known house. The intensely interesting 'Foreword' from the pen of Lord Moulton on the advance of science in the last century is followed by valuable chapters on various categories of scientific books, each chapter being written by a specialist in his own department—Professor Hudson Beare, for example, dealing with engineering subjects, and Sir W. S. Abell treating of naval architecture and shipbuilding. The whole volume, which is beautifully illustrated, is unique in its interest, and is well worthy of the enterprising house whose progress it records, and for which we desire a continuance in its career of prosperity.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

REGINA'S AFTERNOON.

By C. EDWARDES.

PART I.

I.

THE morning letters were delivered at Gwynfrwyn late this Christmas Eve of 1918, and Mrs Lizzie Jones ('L.J.' to the lady-gardeners) was eager for her cup of tea when she had toiled flat-footedly up the mile-long avenue of gaunt, wind-shattered beech-trees to the sinister old gray Tudor manor-house on the mountain-side.

She had some expectations of a Christmas-box as well, upon hints given by the village postmistress that English people were capable of such extravagances; but the Gwynfrwyn cup of tea had been a regular weekday comfort ever since, in 1916, she had entered His Majesty's service to do (and make) her little war-time bit.

But neither tea nor Christmas-box was her portion this day. The two brave young ladies (they were brave, according to local opinion, for devoting themselves to the hardships and seclusions of such a life in such a spot) awaited her picturesquely at the clock-tower entrance, Miss Regina Colway in a yellow-and-black jumper, smoking a cigarette, and Miss Mary Buckstone smiling, her hands stuck in a rose-pink ditto; and two minutes later 'L.J.' began to retrace her steps, with an aggrieved air, and at first only a slight amount of roused curiosity as a set-off.

Her chirpy 'Good-morning, then, my dear young leddies, and a right nice one it is, yes, indeed, for the time of the year—one—two—nine letters it is to-day, two parcels, and three newspapers, and one letter for Megan Evans herself—yes, indeed!' had been a long breath of wasted affability.

She was as surprised as disappointed.

Megan Evans's letter she was taking back with her. This was the small, curiosity-exciting amount of counterpoise to her brace of disappointments.

'Look here, L.J.,' Miss Colway had said curtly, with a puff of tobacco-smoke; 'Megan 's hooked it, so we don't want *that*.'

'She 's not with us now, you know,' added Miss Buckstone, with the graciousness and the smile which were generally characteristic of her. She believed that 'hooked it' might be too idiomatic for a Welsh brain.

'Well, I *never!* Mrs Burscow go last week, and now it is Megan!' commented Mrs Lizzie, and proceeded to inquiries about whys and whens. With reasonable confidence, she hoped that questions and answers would drift her on towards the Gwynfrwyn kitchen, tea, buttered scone, &c. But Miss Colway cut her hopes at the root.

'You know about as much as we do on the subject, old thing,' she declared. 'Beastly nuisance, your Celtic tempers!—Come along, Bucky! And by-by, L.J.'

Miss Buckstone waved two or three kindly brown fingers, and away they made across the quadrangular courtyard for the sombre, heraldic-shielded portico of the ivy-mantled old house. Down in the village the young ladies were often spoken about, in Welsh phrasing, as 'Miss Big' and 'Miss Little,' or 'Miss Dark' and 'Miss Fair,' and they really were strongly contrasted in these respects. But a fine healthy brightness of eye, an enviable complexion, and an athletic carriage they possessed in common, and for a few pausing seconds the postwoman's disconsolate gaze followed them in their effective arm-in-arm movement to the house. The winter sun shone impartially upon Miss Colway's black hair and Miss Buckstone's almost golden.

II.

Regina Colway shut the massive, nail-studded, seventeenth-century door with a swing of her foot, and they settled down to their mail in the window-seat of the low-ceilinged, panelled hall.

There was just one break in their perusals.

'Hello! *W-hat's* that?' ejaculated Regina, with a wrinkled stare towards a gigantic armoured shape in a corner.

'The rat the cat won't face, I expect,' suggested Mary Buckstone lightly.

'What's the *use* of that idiot Tompkins? Ch—Ch—*Ch!* Cat! Cat! Where the deuce are you, you good-for-nothing old stuffer?' shouted Regina at the gloomy kitchen-way corridor. 'Oh, well!' With a laugh that was not hearty, she went on with her reading.

She was through first.

'Time we grubbed, Bucky,' she announced, in

 [*All Rights Reserved.*]

a tone that had none of the keenness of appetite in it. 'Any news?'

'No-o. Only the familiar story. Mother *loathes* our being alone like this, particularly now that Mrs Burscow 's away, and thinks'——

'Same here, only more so!' said Regina, with nod after nod. 'The pater 's absolutely furious about it. Says it 's enough to injure our nervous systems for life, and he 'll write to the shire sheriff or somebody to give us special protection if I don't make up my mind to chuck it at *once*. Three females on their own in a thirty-roomed house, with German prisoners peppered about the landscape—"It 's not *safe*, my dear child!" says he, underlined—I can fancy him shrieking it to the mater. Wonder what he 'd say if he knew the three that was four has now melted to two! That *confounded* little Megan!'

Her hasty footfalls echoed from the corridor.

The sound of plate-clatterings followed before Mary Buckstone decided to join her.

Hitherto their Gwynfrwyn meals had been served to them by Megan, with a certain measure of refinement, in the small and snug oak room known, for some medieval reason, as Lady Betty's Parlour. But they saved labour to-day by dining in the kitchen. There was a cheerful log fire, and they drew the table up to it. Tompkins, the Persian cat (a philosopher), welcomed them to the glow with yawns and a flourishing tail, but, having crunched a dish of partridge-bones, curled up and purred himself to sleep again.

While they ate they discussed the condition of Europe, the rock-garden they were constructing by the lowest of the three fish-ponds, Sir Blackstone Prichard, the aged and eccentric absentee baronet owner of Gwynfrwyn for whom they were working, chiefly in the interest of Sir Blackstone's design of bequeathing his property to the nation for some patriotic purpose, and—Megan Evans. Especially Megan. And with their after-dinner cigarettes Megan's shock of the morning came under renewed consideration.

The minx must have got up hours before the first cock began to crow, and although they missed their early cups of tea, they had descended to an attractive residue of a fire and the breakfast (even its toast) laid as usual under the canvas eyes of the ancestral Prichards on the walls of Lady Betty's parlour. All they had had to do was to boil the eggs and the kettle, and digest the letter which Megan Evans had impaled on the teapot's spout.

This remarkable communication they now read together yet again:

'DEAR MISSES—I am gone and no use you trying to find me at my mothers because I not gone home. You shud not have spoke so sharp to me about being long time at the shop yesterday. A servant girl has her fellings same as you. Them partridges or the rabbit pie and the tin pudding will do you a Chrismas dinner all right. I am sorry about it but you *shud* not have blowed me up like you did Miss Colway even if you be a gentlefoke born. Then theres that poor Germin Hans of Bryntyn you have been so narsty over. Why shud not I be friends with him if I chews. He did not wish to fite the Allys any more than what youselves did and never hurt a sole with his gun being took a prisoner thank Gott he says first chance they give him. Well it don't matter. I sharnt write any more. What 's the use? I done with dull old Gwynfrwyn its gosts and all praise be the Lord. I hope the wether will be suetable for you to-morrow afternoon Miss Colway to meat your sweetheart the captain.—Yours truly MEGAN.'

III.

'So that 's *that*—the malicious little monkey!' said Regina after the reading, her earlier wrath warmly revived. 'I 'll bet L.J. 's made us the talk of the village by this time.'

'Who cares if we are, Colly?' inquired Miss Buckstone, still dimpling prettily over Megan's supremely impertinent reference to Regina's captain. 'But *isn't* her spelling delicious? And, you know, it strikes me as not half a bad epistle in itself. There 's her thoughtfulness about our breakfast, too. I like that the more I think about it. Honest, I do!'

'*Honest*, you say!' Regina pounced upon the word. 'I 'm not so sure about her honesty. We 've gone through the spoons, but I shudder to imagine what other things she may have helped herself to. The priceless old china and uncountable knick-knacks all over the place! As Burscow says, Sir Blackstone must be an ideal old fool to leave such a lot of temptations knocking about. If the pater knew *that*, *my*—goodness! And as for being sharp with her, I only called her a slacker. Where 's the harm of *that*, pray?'

'Oh, there 's none really, of course. I quite agree. But I don't believe she has gone off with anything except herself. And that reminds. You 'll be calling *me* a slacker next, Coll.' Mary Buckstone pushed back her chair. 'One can't expect much more of this decent dry sort of weather in December. I 'll get on with the rocks until tea-time. *You* needn't come, though.'

'I 'm *not* coming.'

'I never dreamed that you were, dear,' said Mary, her pretty dimple in play again.

As a rule they were the best of war-time friends, but Regina detested being taken for granted like this by any one. 'Don't be such an obvious ass, Bucky!' she exclaimed, colouring considerably. 'Er—*some one* must mind the house, I suppose?'

'O-h! I didn't remember that.' Mary's

lifted eyebrows joined in the admission. 'Isn't it a bore? But I don't see why *you* should be the one. We'll toss up. Here's a ha'penny. Heads you, tails'——

'No,' interposed Regina petulantly. '*I'm* going to stay in, I tell you.'

'But it's such a—a "suetable" afternoon for a walk, old girl,' urged Mary, with the smiling ingenuousness that was often such a charm in her.

To-day it was an exasperation, not a charm.

'I don't happen to desire a walk, my dear,' said Regina icily, and then burst forth: 'Why don't you say outright, like that fiend Megan, "Bobby Chirk will be hanging round by the cromlech," and you don't want to spoil sport? It's intensely obliging of you, Bucky, but it so happens she's wrong for once. I have no appointment of that kind with Captain Chirk this afternoon. And that'll do about it—*and* him. I'm fed up.'

Hunching her shoulders, she turned to the fire, and after a moment or two of plain perplexity Mary Buckstone whispered, 'So sorry, old girl!' and left the kitchen.

IV.

Mary truly was sorry if, as she feared from the accent of Regina's 'fed up,' her friend's well-grown attachment to Captain Bobby Chirk of the Shropshires, in the camp three miles the other side of Moel Ddu, the Gwynfrwyn mountain, had suddenly come to an end. She herself liked the little she had been permitted to see of Captain Bobby, and there was no denying that Regina had been a pleasanter companion in every way since that November afternoon when, kerchiefed and looking rather like a couple of Sicilian peasant girls, they had found him in the Gwynfrwyn drawing-room, stuttering perspiringly at Mrs Burscow's hard-featured face (including a moustache) about his ambition to explore the ages-old underground passage from the manor-house to the seashore. Mrs Burscow opposed his desires in the matter. She gave him to understand that the secret passage was a sort of sacred family myth. This, with some tea, was all she did give him. When, with his eyes upon Regina, whose ankles above her hob-nailed brown brogues were of the neatest, he half suggested a second visit, Mrs Burscow shook her head uncompromisingly. 'Sir Blackstone would not like it,' she said, 'and neither should I,' with such emphasis that he grasped his hat forthwith. But herein Mrs Burscow's prudence, or whatever it was, had overshot its mark. Regina flared up becomingly about such excessive regard for duty and the proprieties, and announced that, if it was all the same to him, she and Buckstone would accompany him for a mile or so on his return tramp. They could do with a 'stretch,' she said. Captain Bobby responded with enthusiasm. 'Rather, indeed! Nothing I could have wished for more, by Jove! —if I'd *dared*, you know.' The 'dared' was a mild retaliatory flip for Mrs Burscow, but the wish was an inspired straight tribute to the beauty of Regina's flashing eyes.

That was how the romance had begun, and from the warrior's subsequent more or less clandestine reappearances in the neighbourhood, and the very marked change for the better in Regina's looks and spirits, Mary had drawn the natural conclusions. Moreover, Captain Bobby had switched his antiquarian interests from the Gwynfrwyn secret passage to the Gwynfrwyn cromlech, a capital specimen of its kind, on Moel Ddu's slope, and Regina had become surprisingly well informed about the Druids.

And now this bomb-like avowal of Regina's that she was 'fed up'—in other words, that her romance was over!

Mary Buckstone crossed the upper lawn with an unaccustomed sense of depression. Dark billowing clouds and a wind from the sea had set in, and the dead tops of the Gwynfrwyn trees were swaying and dirging dismally. In the middle of the lawn, and shadowed by a battered cedar (Elizabethan at youngest), was a leering once-white marble imp, now distressingly greenish from damp and neglect, whose strained attitude almost upon its toe-tips, with two broken-fingered hands extended towards the house, not at all with an air of blessing, was never exactly entertaining. To-day it was an abomination, well calculated to increase Mary's uneasiness as she booted past it with averted head and down the three sets of steps to the nethermost fish-pond, which the rock-garden was to embellish.

Fond as she was of Regina, she had no illusions about her. Colly's was distinctly not a temperament to be sweetened by adversity in solitude, and this Bobby Chirk trouble, ensuing upon (or perhaps only just preceding) Megan's desertion and cheek, both combined with the always rather, and now exceptionally, nervy atmosphere of the place, augured an anything but happy Gwynfrwyn Christmas-time.

Fortunately 'the curse of Eden' enabled Mary to suffocate her own personal megrims of the moment. She was an earnest spade-lover, and that humble instrument of toil soon rewarded her with all its available consolations.

V.

Regina in the meantime had fallen an equally prompt prey to certain unexpected but not at all unnatural emotions, which were now to head her straight towards surprising consequences.

Scarcely was Mary Buckstone off the premises when she realised that there might be some painful truth in her father's letter of the morning. The house seemed suddenly to have transformed itself into a musical-box—the music devilish. That rising wind from the sea had,

in fact, started its tricks in the corridors and the upper storeys when they were at dinner, but Mary's society and their joint preoccupations had then kept her from noticing them. Now acutely aware of them, she had just glanced round, as it were, to the call of a particularly hideous caterwauling of whines and moans, when a sound like a staccato thunder-clap over her head brought her to her feet with a bound, tingling all over.

'What —in the *world?*' she gasped, her hands to her breast.

Her cogitations were quick—and unsatisfactory.

The crashing-to of a window left insecurely open she could have understood. But this was something on the leviathan scale. Massive though the old house was, she had felt it shake —or fancied so—to the shock.

An intense longing for Mary Buckstone was the first of her brain's following activities. This she dismissed with a short, mirthless laugh. Never yet had Gwynfrwyn made her hang out the white feather; nor should it now. Whatever the mystery, she would elucidate it for herself, by herself.

An unsolicited second longing then sneaked into her—for Bobby Chirk this time. And this also she stifled scornfully at its birth. With scorn, moreover, that worked upon her like brandy, and sent her treading off into the corridor, head defiantly erect.

A few moments later she was back again, and with no thought of the absurdity of challenging an unsubstantial noise with a firearm, she took from a drawer in a side-table a slender, long-barrelled pistol. Times were when she and Bucky had tried to kill rabbits with it, always unsuccessfully. Her agitated brain flashed a vision of the thing at her, and she had responded to the hint.

With steadier eyes, but continuing heart-tumult, and a finger on the trigger, she returned to the corridor.

Thence to the low-ceilinged hall, in which the wind was now practising a chorus of lamentations; and here she at once perceived something. The vizored helmet of that armoured shape in the corner was askew, and one of its gauntlets lay, fingers crooked, by its long-pointed metal toes. Worse still—when, with an enlarging stare, Regina approached it, and, after a straining effort (for the armour was of the thickest plate period), moved it and its stand a few inches from the wall, she discovered traces of fresh farmyard soil and the unmistakable print of two twentieth-century boot-heels in the accumulated dust on the parqueted floor behind it.

VI.

'My God! There's a man in the house!'

The words shouted in her, and for several spell-binding seconds she stood as rigid as the shape itself under the menace of this alarming, inevitable deduction. The pistol, which had slipped in her hand, drooped its barrel floorwards. The man had been concealed there, eyeing them through the armour's chinks, while they were reading their letters. He must have stolen into the house when they were on the look-out for 'L. J.' under the clock-tower. *He* was the rat of whom Bucky, in her innocence and justified contempt for Tompkins as a hunter, had made such airy mention.

Slowly—very slowly—Regina gathered her courage together again. Having gallantly resisted the almost driving instinct to rush from the house down to Mary among her rocks, she drew a deep breath, and exhaled it with a vigour that resounded even above the wind's many-voiced orchestra.

The memory of a conversation with Bobby Chirk had come to her as a stimulant. 'My dear Regina,' he had said that day, with her hand hard pressed in his, 'you need have *no* fear of the Gwynfrwyn ghosts. But what I *don't* care to think about is you three ladies at the mercy of two or three—or even only one —flesh-and-blood marauding scoundrels any one of these coming dark winter nights, and the nearest constable an ugly mile away! How do you suppose you'd deal with such a situation? *Tell* me.' She had not been able to tell him off-hand like that. He had been a dear boy that day — itself a bright and beautiful one—and so she had simply laughed and replied, 'Blessed if I know. I suppose we should worry through somehow, in the usual British way.'

'Three,' he had said. And here she was being tested — alone! Well, so be it. He should see; or, rather, he should learn about it. And Bucky should see. And the village, in its snug, safe nest so far, far away, should rejoice in its wisdom that it had made no mistake in acclaiming the Gwynfrwyn lady-gardeners as worthy to be ranked among the boldest of the bold even in a war-time of heroes by the multitude.

Regina examined the pistol. Two of its chambers were loaded. Good! Silly of her not to have made sure sooner, but these two little cartridge friends were hailed as an instant tripling of her strength. Only one man could have stood hidden behind that armour, and if, as was just possible, he was without a pistol, when called upon she might play the 'Hands up!' game with the luck and the honours on her side.

A brief and dignifying vision came to her of the wretch plodding down the avenue, his hands still in the air, and of herself behind him, ready to perforate him at a moment's notice.

(*Continued on page 226.*)

FOODS AND HEALTH.

By P. Roualeyn Gordon.

IT is when we are sick that our philosophy of life is put to the hardest test. It is the most difficult of mental tasks to be resigned to physical suffering and incapacity. True, there have been cheerful sick men in history, but they were (and are) few and far between. No one wants to be ill; everybody desires health. Many would give all they possess for health, but it cannot be bought. Rockefeller, it is said, so impaired his constitution by the nervous strain of acquiring excessive wealth that he lost his hair, his beard, even his eyebrows, and his stomach refused to digest food. Yet with all his millions he could not provide himself with another stomach. A truer statement was never made than the one made by Max Nordau, the author of *Degeneration*—'No other business in this world pays so little as the chase after millions.'

Modern life imposes a heavy tax on human energy, and good health is absolutely necessary in the struggle to achieve success in any line of endeavour. Most of us become so absorbed in our efforts to attain our desires that we neglect that which is of far more importance to us—the care of the body. Consequently, when we become sick and are compelled to seek advice and treatment, we realise—probably when it is too late—the value of nature's greatest gift to mankind.

Health depends principally upon diet, climate, altitude, temperature, air, occupation, and motion. These are the most important considerations for almost everybody. Of these diet is probably the least studied and the least understood by most people. Yet the right kind of diet is essential for maintaining good health, besides being a valuable ally in the fight against disease. The human race is composed of so many different temperaments and constitutions that to lay down hard-and-fast rules of diet is impracticable. The food that suits the full-blooded vital type of man is entirely unsuited to the requirements of the anæmic individual.

A great deal also depends on the quantity and the quality of the food consumed. Many people—unwittingly, no doubt—eat more than the body actually requires for health. As a rule, a man of general proportion, one who exercises sufficiently every day to maintain health, requires per day five ounces of nitrogenous food-stuffs for the muscles, twenty ounces of carbonaceous food-stuffs for heat, one ounce of salts for brain, nerves, and bone, about one gallon of liquid for the body, the functions and the glands, the secretions and the blood, to enable the system to perform its work efficiently. He requires, in addition, waste for bulk and some natural acids to enable the eliminative function to go on with its work. He needs natural acids for the liver.

The great danger is in eating too much heating food, to inflame the blood and lay foundation for disease. Most foods contain carbonaceous elements too abundantly. There is some danger of eating nitrogenous food-stuffs in too great quantities, but the danger is not so great. A man living on nothing but cheese would at last reduce his stomach to about one-third of its original size. Hence the stomach would not be able to secrete sufficient gastric juice to carry on the process of digestion. Some foods are very rich in nitrogenous food-stuffs, such as cheese, beans, lentils, lean meat, liver, kidney, ham, halibut, and some other kinds of fish. People who are emotional or who study hard are in need of phosphates. A tired brain needs phosphates. A weak stomach requires sodium. A sluggish liver needs acids. A sluggish circulation needs oxygen. If a weak, tired person eats foods containing phosphorus, his step will become more lively, his eyes will become brighter, and that 'tired feeling' will depart. Phosphorus is contained in bran tea, in whiting, turbot, smelt, plaice, lobsters, trout, figs, barley, and in certain vegetables and fruits, though not to any great extent.

Practically all disease is due to one cause—wrong living, especially to wrong eating and shallow breathing. These errors sometimes result in an acute disease that may suddenly end the sufferer's life, or if the individual has fairly good resisting-power, the stored-up poisons in the blood may result in later years in chronic disease. Whatever that disease may be, it will invariably affect the weakest part of the constitution. Temporary relief may be obtained from drugs and in other ways, but a cure will not be effected without regulating the diet to suit the particular constitution.

Indigestion is probably the most common ailment of the human race. It is caused in many ways. Writers, medical authorities, food scientists inform us that indigestion is due to overeating, lack of exercise, poisonous substances in the system, over-indulgence in liquor, cold, &c. These are the seeming causes, but are in reality not direct causes. The causes are temperamental, psychical, constitutional. One man can eat anything at one time of life and not suffer from indigestion. At another time he cannot eat anything without having digestive disturbance. Other people, again, are never troubled in this way, no matter what or how much food they eat. They can eat heavy meals at any time; they can be up all night; they can pass through the most intense ordeals

of grief, disappointment, passion, and unfavourable emotions, and not suffer from indigestion. They can live in hot or in cold regions; they can eat fats, oils, starches, soups, beans, peas, and mix their foods with liquor, wines, coffee, all kinds of condiments, spices, yet are never troubled with disturbances of the digestive functions. The direct cause of indigestion is weakness of the vital faculties, the particular temperament, and the direction of thought action. To develop the vital side of man cures indigestion when fasting, hygiene, diet, and drugs fail.

People of certain temperaments have naturally weak digestive organs, and they are in many cases the worst offenders of diet rules. The tall, thin, bony individual of an atrophic temperament, whose digestion is poor, is invariably a hearty eater, and is in danger of overeating. The more he eats, the more lean and bony he becomes, and the more hungry he is—or thinks he is. He eats to excess, and his digestive organs cannot digest the food he eats. To increase weight a lean man should consume about one-third as much food as he does. He also needs a warm, slightly moist climate and a comparatively high altitude, though too high an altitude is not good for a lean man who is very nervous; it will draw the blood to his brain too strongly, affect his blood-pressure, and cause sleeplessness.

In the right climate, with the diet most suited to his constitution, and with the right kind of employment, the atrophic man will improve in health and in physical development. Wind, excessive moisture, cold air, exposure have a very marked effect on him. So soon as the temperature sinks below fifty or rises above eighty-five degrees Fahrenheit, or if the air-pressure be too high or too low, or if there be changes in the electrical tension of the atmosphere, or if the wind be strong, or should the diet not be suited to his needs, or if there be changes of any kind, the atrophic man feels the change at once. He is a human barometer; he feels an approaching change in the weather before it actually takes place; he grows sleepy before a storm and after a heavy meal. His most invaluable doctors are dryness, ozone belts, and a uniform temperature of about seventy to eighty degrees Fahrenheit. Mentally this type of man is a giant, but vitally he is a baby. Yet, to look at him, one would never believe that he is so delicate as he is. The least thing will affect his health. He is tall, broad-shouldered, seemingly vigorous and full of vitality; yet he is weak constitutionally. In some cases it is the digestive organs; in other cases it is the lungs. In this temperament the more vigorous the intellectual processes are, the weaker the nutritive functions will be. When he is well, no man is more reliable, more industrious, more accurate and painstaking in all his work than the atrophic man. Some of the greatest men in history—in literature, science, philosophy, mechanics—were of this constitution.

Because of their temperament and brain development, atrophic people are very fond of fats, fatty meats, fatty fish, fatty foods, oils, soups, nuts carrying oils. They like cream, and can eat butter by the pound. They need fat and oils for nerve, brain, lung, and marrow. Yet they cannot assimilate fatty substances. Many of them lack red blood-corpuscles. Hence they like red meat. They need meat-juice, but not the fibrin of the meat—that they should leave alone. Foods containing lime salts, iron salts, sodium salts, silicon, and phosphorus are absolutely essential for their system; but the diet usually adopted by people at large and the atrophic type in particular does not furnish enough of calcium even for a small-boned rabbit, and calcium is the very food-element that atrophic people, above all, need. They require lime salts in great quantities for their digestion, bones, and blood; in fact, they can never get enough of these salts for their needs. For this reason a diet composed of cow's milk, if possible warm from the cow, and whole wheat bread toasted is the very best diet for them. Milk-puddings, fresh raw eggs in milk well shaken, spinach-juice with sweet-milk are all excellent foods for people of this temperament. In addition to lime salts they require iron salts in abundance. Iron is necessary in the body for many reasons, but the main reason is that it combines with the oxygen of the air, so that oxygen can be carried to the tissues of the body and thus help elimination. Lack of iron in the blood will cause the whole system to become clogged, with consequent disturbance of all the organs of the body. The best iron-carriers in foods are kidney-beans, spinach, asparagus, watercress, dark fruits, and raw egg-yolk. Care should be exercised in the use of iron-carrying foods. One wine-glassful of blackberry-juice per day is enough iron for the average person. Two large dishfuls of watercress once per day will give the system the iron that is required. Three egg-yolks per day yield sufficient iron for the blood. Egg-yolk is rich in iron and phosphorus, and is easily digested; but because of the amount of sulphur it contains egg-yolk is not a good food in times of liver trouble, or when the venous system is dull and sluggish. Sulphur will clog the liver and give rise to sulphuretted hydrogen gas.

The indigestion which the man of the adipogenic constitution suffers from is of an entirely different nature from that of the man whose temperament is atrophic, whose stomach is as dry as sole-leather, whose skin is dry, who has no more oils, juices, secretions in his system than a dry bone. Adipogenic people, or 'porky' people, as they are vulgarly called, are very fond of fat-producing foods; in fact, their system is simply hungry for fats, oils, starches, and sac-

charine substances. Their blood is full of fatty acids; there is a lining of fatty tissue under the skin. Their skin in the warm summer weather is oily. If they perspire, they exude droplets of fat or oil. They suffer from fatty degeneration of the heart or the kidneys or the liver. They require a diet free from oils and fats. A fairly good general diet of this kind is lean meat, green vegetables, turnips, bran bread, acid fruits (limes, lemons, sour oranges), rhubarb, claret. Foods that should be left alone are barley preparations, pastry, sweets, sugar, dates, all kinds of starchy foods. A cold, dry climate and a high altitude will help to reduce the excess of fat. Hot water will help to remove the fat, and yet people of this constitution are fond of very cold water because it will make them feel more comfortable for the time being, only to increase the appetite for fatty foods. Massage, Turkish-baths, steam-baths, hard physical work outdoors are excellent fat-reducing agents.

People who suffer from flatulent indigestion should leave vegetables, fat meat, and starches alone, or all foods that have a tendency to produce gas. Figs, eggs, cabbage, onions, cauliflower, sprouts, radishes, and most vegetables are gas-producers, and should be used sparingly, if at all, by dyspeptics. All foods that are antiseptic in nature are good in times of flatulence, such as milk with lemon-juice, dandelion, spinach, parsley, lettuce, apricots, tart apples. Rice or tapioca, as a starch food, will sometimes agree.

Heavy meals should be tabooed by people with weak stomachs. Nibbling at food is preferable, with one food article at a time, the food being changed at every meal. Fruits, vegetables, milk, soup, meat, wine, should never be mixed at one meal or the dyspeptic will have a hot time.

Chewing something that excites the saliva of the mouth is excellent, as it supplies the alkaline principle to the system, so necessary in those with chronic indigestion. One man we heard of cured himself of indigestion, when all other methods failed, by eating raw bran, now and then, during the day. Raw bran and raw food may help some, but raw food is difficult of digestion. Thinking of food and relishing food until the saliva flows are great aids in overcoming digestive troubles.

Foods should be studied from many standpoints. One food may be rich in a certain element, but may lack another. It may be difficult to extract the nutritive material from a certain food because it is difficult of digestion—pork, for instance. Therefore one food may not have the same value as another food. It can be said, in regard to dietetics and tables of food value, that they are very unreliable, for the simple reason that the chemist may give only the elementary constituents and not think of the difficulty of digestion, or of some other conditions connected with that special kind of food. Dietetics is a more important science than most people realise. If we feed the body with that which is needed in individual requirements we shall be more healthy; there will be less sickness and fewer undertakers.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER IV.

I.

MEN bore down on Clement Seadon in a terrific rush.

It was a trap. Clement realised instantly that it was a neat one. The thought, however, did not rob him of activity. The nimble and smooth wits that had made him an excellent fighting-man, as they had made him an excellent diplomatist; the sense of instinctive action that every sportsman must possess if he is to be ranked as anything of a sportsman, functioned immediately. In that room of deliberately planned darkness men were coming at him. And they had flashed the blinding rays of an electric-torch into his eyes for a definite end. They expected him—as any cornered animal would—to charge at that torch.

Clement did not.

He swung cleanly on his heel, and was jumping as he swung. His agile senses caught all the details of the room as the torch revealed them. There was the door—and a crouching man by it, ready for him. There was another man swinging in from the left. In that instant's vision Clement changed direction to the right. The window with its flimsy covering of advertisement and glass was to the right. If he shattered that glass there would be an uproar in the Sault Algonquin. He jumped for it.

An oath behind him. Something whistled through the air—ineffectually—hit a wall with a soft, heavy, and terrible thud. 'Sandbag,' registered Clement's brain, working at express speed. Another oath; he zigzagged a little as he jumped. Miss again. A lithe shadow, a lean and leaping shape like a cat, shot from the ring of darkness into the dazzle of light. Clement saw a fierce face hanging before his, brows down and knotted, lips, cheek, nose even, all puckered together with a feline ferocity. One hand was stretched forward, to clutch.

The right hand and arm were up — holding something, striking.

'Siwash,' Clement's brain signalled in its flashing way. Even before the name was realised, Clement had, no, not stopped and ducked that blow, but had spurred his body forward with a quicker drive of his foot. He was into Siwash two seconds before the half-breed had timed to loose his stroke. The hand, with a stick in it, threw itself away harmlessly over Clement's bunched shoulder. And at that instant Clement punched. He upper-cut with his left, hard and sure. Siwash jerked upward grotesquely, his toes turning in, as though he were trying to keep them to the ground as he rose. Then he went over wildly into the blackness—disappeared. Clement's hand was on the advertisement-boards that screened the window. Mr Adolf Neuburg was on him.

The mountain of a man with his unexpected and terrible agility swept down on him from nowhere, it seemed. His great hands went out plucking at the young Englishman. His vast fists were free of weapons, for he was confident in his enormous strength. And he grabbed at Clement; he did not hit—that was foolish. His hand closed on Clement's upper arm, swung the lighter man round. Then Mr Neuburg uttered a curious, staccato yell. As his hand closed on the arm, the arm, instead of being wrenched away, had closed on the hand, the upper and the lower arm coming together. As the Englishman swung round his body doubled forward, and Mr Neuburg's arm, caught and twisted, was vilely wrenched. The fact that Mr Neuburg endeavoured to save his wrist and forearm by exerting his huge strength only made matters worse—that is the great truth underlying Japanese wrestling. But Mr Neuburg did not know that.

He snatched his hand away as Clement unhinged, but only to receive a snapping right-hand swing to the side of the head. He bellowed, waving his strained hand, and made a furious swipe at the Englishman with his left. Clement ducked it, slipped in under it, banged right and left to Mr Neuburg's great face. And Mr Neuburg went down. He went down not because he had been knocked out, not because he had become unconscious, but because Clement had employed a trick he had once seen a shifty boxer use. As he jumped in to hit he had slipped his left toe behind Mr Neuburg's heel. The force of the blow had sent Mr Neuburg reeling over that toe, had brought him down.

But Mr Neuburg had served his purpose. He had delayed Clement. Clement knew it. Directly he had struck the mountain of a man he darted, not towards the window now, for the other men—how many were there?—must be converging on that, but towards the door again, which doubtless had been left unguarded. The tussle had lasted moments only—but——

The man who had held the electric torch had not moved during all the fighting. He stood there invincibly. It was Joe, who was slow, but enduringly calm. He had seen Siwash go down and out. He had seen the massive Mr Neuburg go down. He had stood still. He saw Clement dart away from the window towards the door. He stood still. His hand still held the glaring torch steady. But his other hand moved. It moved in a long, swinging arc. It completed its swing at the moment Clement's hand touched the door-handle. Clement slumped forward against the door, was supported by it for a second, and then crumpled nervelessly to the floor. The sandbag in that swinging hand had reached its mark on Clement's head with a beautiful accuracy of timing.

Joe stood still. He played the light round Clement's inert body. Mr Neuburg scrambled to his feet, snarling because he tried to help himself up with his damaged wrist. He came to Joe's side. He stared at the felled man for a moment. Joe put out his hand and clicked on the electric light. Both rogues stood over the Englishman. He did not move.

'Some fighter,' said Joe. He gazed down with grim admiration. He looked at Siwash, still prone; he looked at Mr Neuburg's palpably damaged face and wrist. A fourth man, so tall and thin that his bones seemed loose and rattling, joined the two. He was the only other in the room. He held a sandbag in his hand, but he had the general air of being a worker, a tradesman. That gave his furtive pose a tone of nervousness. He looked at Neuburg, moistening his lips in agitation, and did not speak. He looked at Joe, and did. 'Dead?' he asked hesitantly. 'Dead?'

'Aw,' said Joe without passion, 'you make me tired. A little knock like that killing any feller!'

Mr Neuburg looked across the tall, thin man's shoulder with an emotionless chuckle. 'Since our good Louis took to glue his moral sense has become—shall we say?—very sticky,' he said softly.

'Well, mustn't one preserve appearances, Adolf?' the thin man protested nervously. 'Now, mustn't one? If anything happened to cause trouble, would it help me—any of us? It is by keeping up the appearance of—of honesty that we—we'——

'Timidity has given our dear friend Louis a certain wisdom,' said Neuburg, smiling his creaseless smile. 'There is something in what he says.'

'That means,' commented Joe without emotion —'that means you ain't goin' to dump this coyote inter the river.'

'No—no—no,' cried the glue-maker feverishly. 'If it got out, that would'—— The man Louis seemed to have a terror of finishing sentences.

'Aw, you 're crazy,' said Joe. 'You make me real tired. Get quit o' him once and for all, I says.'

'The shock of the water would bring him to,' murmured Mr Neuburg, not in friendliness towards Clement, but in speculation.

'We could fix that—rope him,' said Joe.

'And that would indicate foul-play. So would hitting him over the head, or shooting him before we slipped him into the St Lawrence.'

'I could keep him safe,' put in the timid Louis. 'Safe, up at top of house. In that room he'd never get out. You see?'

'He'd have to get out sometime,' said Mr Neuburg.

'I'd see that he didn't.'

'For ever?' put in Joe dryly.

'Well—for long enough. For days, for a week, or until you've got things fixed.'

'That's all right,' said Mr Neuburg with quick decision. 'You take him up to that room of yours and keep him tight. Don't forget he's a cunning one, whatever you do. I'm not a pleasant person to have trouble with.' Louis cringed away. 'Right; you understand that. In a few days we'll telegraph you. Then you can let him free.'

'To raise hell,' sneered Joe sullenly, startled and puzzled by Mr Neuburg's decision.

Mr Neuburg turned with his silent swiftness on Joe. He gazed bitterly across Joe's shoulder. 'Do I give orders, Joe, or do you? Do I make mistakes, Joe, or do you?'

Joe shuffled his feet anxiously. Mr Neuburg was not looking at him, but Joe dropped his gaze to the dirty floor. 'Oh, I know you're the brains, boss; but I don't see'—— he muttered.

'I'm seeing for you,' sneered Mr Neuburg coldly. 'You're a bright feller in a rough house, but thinking isn't one of your assets. Just for that I'll explain to you. Item one: we don't want trouble in this business. Item two: if we can squash trouble, it's wiser to squash it. Item three: if we can make this fool Englishman feel that he's played a losing game; that he's only butting in where he's not wanted—by the girl; that the girl is happy and content with what she's doing, an' so on, an' so on—well, he'll stop making trouble right then an' there. Item four: given that the girl is what we know she is, and Gunning being licked up to the scratch, an' the pair or twain thrown together—well, she'll be content. Do you follow now, my friend? This Heloise girl meets Gunning. Gunning is love's young dream to her. They fix it up together. That's settled. We wire Louis here to release this feller; he can even let drop where he is to find the girl. Seadon comes chasing after her. He finds her. She hasn't a glance for him. She is all for Gunning. Maybe, even, she has married him—I think we can fix that up, get a reason for the hurry. Anything this Englishman says to her, he says against Gunning, so it will be an insult. He'll be simply out of it. She won't look at him or listen to him. So he goes away quietly, for her sake. Do you see now?'

'If he *did* go away quietly,' said Joe haltingly. 'It has a good sound, what you say; but'——

'And if he doesn't go away quietly,' said Mr Neuburg in a soft, cold voice—'well, we shall be, perhaps, in the wilds; at Sicamous, or somewhere. Away from cities and men, from people who ask questions and pry deeply. In the wilds *accidents* have a more plausible air, my good Joe; dead men are less noticeable.'

Joe looked at the big mountain of a Mr Neuburg with a wide-eyed gaze. 'You're a wonder of a devil, Adolf,' he said.

'Take his head, Joe; Louis will probably drop him before we get to that room at the top.—Louis, his legs.'

Thus, at some indeterminate hour later, Clement Seadon, conscious of the racking pain in his head and the anguish caused by the cutting ropes at wrist and knee and ankle, came to his senses in a dark room at the top of the glue-maker's house.

(*Continued on page 229.*)

RAILWAY ACCIDENTS IN INDIA.

I.

NOTHING is more interesting to the average railwayman than measures for the prevention of accidents, and the investigation of their causes when they occur; not only because of the horrible and expensive consequences they may entail, but, in addition, because training on a railway teaches, or ought to teach, everybody concerned to keep a sharp look-out for any defects, of material or practice, that may possibly lead to an accident in the future. A careful study of past mishaps provides the widest and most economical mental equipment for a man whose duty it is to prevent similar occurrences. If his mind is of a type that can get its experience only from facts with which he is personally connected, he is not suited for responsible railway work, and is a bad bargain, even if he never actually contributes to an accident.

In India all accidents have to be reported to the Railway Board; and the term 'accident' includes such unexciting events as the derailment of a goods-truck when shunting, or the natural death of a passenger in railway premises; and also, at the other end of the scale, collisions between running trains, attempts at train-wrecking, and numerous other occurrences. Observe

that an attempt at wrecking a train constitutes an accident; it is not necessary for any damage whatever to be done. In the same way, a fire that involved a likelihood of damage, and an averted collision, are both dealt with as accidents, on the principle that prevention is better than cure. 'Safety first' is one of the oldest maxims of railway working; and a 'safety rule' is one that is rigidly enforced, unless it can be conclusively shown that it was safer in the circumstances to disregard it.

Most bad accidents have one of two causes: the failure of material, such as the breaking of an axle, or the failure of the human element—for example, a mistake made by an engine-driver or a signalman. The two may overlap; there may have been negligence in testing or examining the axle. 'Natural causes,' also, may lead to a mishap; but as new rules are made, when experience shows it is necessary, to eliminate risk on this account, accidents from natural causes continually tend to decrease. For instance, if, as has happened, a train is blown over at some exposed place, instructions are issued that trains liable to this risk should take refuge in cuttings or other sheltered places when it seems advisable.

II.

Though conditions in India are very different from those in England, the safety of passengers carried in trains is as carefully considered in the one country as in the other. Of course, one or two bad accidents in a particular year may cause a large increase in the number of persons killed and injured; but, on the whole, a man is as safe in a train as anywhere else, provided he exercises reasonable care. As an example of accidents due to the passenger's own fault may be mentioned those resulting from a very common habit among Indians—that of sitting in a train with their feet sticking a considerable distance out of the window. It is bad enough for heads or elbows to be exposed to a blow from an open door, or from a carelessly placed tool on an engine, but legs project much farther; and Indian railways now place in every carriage notices, printed in three or four languages, warning passengers against this dangerous practice.

One cause of the greater liability to accident in India is that most of the open mileage in that country is single line. This introduces the possibility of head-on, or, as they are called in America, 'butting,' collisions, which are practically unknown on double lines, where trains follow one another in the same direction. Of course, each train should have an authority to proceed, or 'line clear,' which is either obtained from the next station by telegraph or by means of an electric token instrument, which is supposed to be foolproof; but negligence in the upkeep of the instrument, or the delivery of the token to the wrong train, has led to accidents; while drivers have even been known, in a fit of aberration, to run without a 'line clear'—one of the railwayman's unforgivable sins.

Again, Indian stations are not so universally, or so completely, interlocked as they might be; with the result that signals can sometimes be lowered for one line while the points are set so as to guide the train into another. The rules for setting the points are perfectly clear, but constant supervision is necessary to ensure strict adherence to the rules, and India suffers from too little supervision.

III.

This brings us to another great difference between Indian and Western railways—the quality of the human material employed. The literate classes in India consider it beneath their dignity to do anything with their hands, except wield a pen or its equivalent; so that the ordinary station-master starts his professional career as a telegraph-operator, and, after an examination in the rules and a little practical instruction, is sent to a small station as assistant station-master, and is generally in entire charge during his hours of duty. The actual setting of points and pulling of levers is done by 'menials,' as they are slightingly called—ignorant, illiterate men, who have few opportunities of promotion, and are content to follow their humble calling for the rest of their lives. Though their minds are untrained, these men usually get a thorough grasp of the few duties required of them, and do their work faithfully and well. Indeed, the menial station-porter is the backbone of the Indian railway system. His superior, the 'babu' station-master, on the other hand, often takes little interest in his work, except as a means of making money, though there are keen men among them. But even the zealous tend to become discouraged by the baneful system of promotion by seniority that frequently prevails, depriving men of any incentive to good work. The enervating climate, and the extraordinary idea prevalent in India that adipose tissue is a sign of dignity, result in the paradox that promotion to more responsible positions is, apart from greater opportunities of graft, chiefly prized because the promoted man has more subordinates to take actual responsibility off his shoulders. The eagerness to cultivate a 'presence,' as a paunch is euphemistically called, is illustrated by the story of some regiments in the Indian Army, in which superfluous flesh in a junior is visited by fatigues and other figure-restoring devices; but where, on the attainment of high rank, an increasing obesity is not only permitted, but encouraged. The greasy food beloved of the Indian, together with his capacity for a sedentary life, bring the attainment of a satisfactory figure within the

reach of all who are opulent enough to give rein to these tastes.

IV.

Other rarer causes of accidents, from which English railways are almost entirely free, are the buckling of the line owing to the great differences of temperature by day and night, train-wrecking from political motives or in the hope of robbery, and the washing away of the line by floods during the monsoon.

In the hot weather the metals expand considerably during the great heat of the day, and, if there is not enough room between the ends of adjacent rails, they press against each other with such force that the rail is bent in a curve, and a vehicle passing over it gets derailed. Rails are constantly 'creeping,' or moving slightly in the direction of the heaviest trains that pass over them; and if they are not frequently pulled back to preserve the proper intervals between them, disaster will certainly result.

Train-wrecking is, fortunately, not common, but it is occasionally attempted at times of political unrest. The aboriginal and criminal tribes, too, which are scattered over India, are not above trying to wreck goods-trains, especially during famines, for the sake of the large quantities of grain and other food that is then carried about the country. These people do not, however, often go to such lengths, as they can generally steal all they require from a train standing at a station or outside signals at night.

Excess of water, or the want of it, are two ever-recurring troubles in India. In dry seasons it is difficult to keep the train service going, and whole trains of water-tanks are run daily in places for the railway people and the engines; while in the rainy season heavy floods breach the line or scour away the approaches to bridges over large rivers, with the result that through-traffic may be interrupted for weeks before communication is restored. As railway lines are still few and far between, and distances are long, it is quite possible for a detour round the breach to involve one or two days' extra travelling; so that the usual practice for intending passengers is to sit patiently at home and wait till the damaged line is restored. The extent of these floods may be imagined when it is stated that a locality having a normal annual rainfall of twenty-five or thirty inches may get as much in three consecutive days of downpour; and the volume of water that flows in the monsoon down the larger rivers, some of which are almost dry in the hot weather, must be seen to be believed.

V.

Having mentioned some of the causes of railway accidents in India, we may pass on to describe the way they are investigated. The regulations require that every serious accident, within seven days of its occurrence, should be fully inquired into by a 'Joint Inquiry Committee,' composed of the traffic, engineering, and locomotive officers of the district in which it happened. Other officers, such as those of the signal or the carriage departments, sit on the committee when there is any possibility of their branches of the railway service being concerned, and an official appointed by the Government is also entitled to attend; but the three first-mentioned form the nucleus of the inquiry. The committee inspects the site of the accident and the condition of the permanent way, rolling stock, signals, and anything else that promises to throw light on the occurrence; and it also takes the evidence of witnesses. For reasons that will be mentioned directly, it is often difficult to be certain of the cause of an accident, but the committee is obliged by the regulations to state its opinion of the cause. If one or more members disagree with the 'finding' or verdict, they state their opinions separately, giving full reasons for them, and the whole report is then signed and sent to headquarters to be dealt with. It is even possible for each member of the committee to hold a different view of the cause of the accident, but in practice it is found that agreement is usually reached.

It may be difficult, for several reasons, to find the cause of an accident. For instance, after a derailment it is sometimes found that extensive damage has been done to the permanent way and to the rolling stock; it is then hard to decide whether a broken rail or axle caused the derailment, or resulted from it. The engineering department naturally maintains that the road was all right, and the locomotive and carriage officers assert that nothing was wrong with the engine or the vehicles. The driver and the firemen, if they were not killed, were too busy trying to stop the train or jump clear of the overturning engine to have much idea of the sequence of events; while the guard and the brakesmen were hanging on to something to prevent themselves from being thrown out, or were being rattled about their vans like peas in a pod. Even in such cases it is sometimes possible to arrive at a satisfactory conclusion, but derailments are often considered unaccountable, though the probable reason has always to be stated.

VI.

But the greatest difficulty experienced in coming to a correct conclusion results from the Oriental habit of misrepresentation. Nobody admits having made a mistake, and evidence is carefully prepared beforehand, so that the findings are, as often as not, directly opposed to the bulk of the evidence. The old story of the magistrate in India, who used carefully to write down what all the witnesses said, and then decide the case on the spin of a coin, may, or may not, be true; but the fact remains that even

witnesses on whom no blame for an accident can possibly be fastened will give the most imaginative versions of what they saw or did. Whether it be from friendship or dislike, or in order to curry favour with his immediate superiors, every man takes sides, and devotes his energies to exonerating a friend or incriminating an enemy. There is generally a standing feud between the traffic staff of a station, who admit trains and work the signals, and the drivers who run past the said signals, each party blaming the other for having done the wrong thing. When a station is interlocked, the task of the committee is sometimes appreciably lightened, as it may be possible to show that a good deal of the evidence is disproved by the interlocking, some of the movements described having been mechanically impossible.

A good story appeared a few months ago about an officer who discovered that there was one machine-gun missing out of the fifty in his charge. His method of restoring it was to submit a series of indents for new parts of machine-guns, to take the place of old parts condemned, and when all the parts had been received, he fitted them together to form a new gun. In India the supervising engineers usually inspect the line on trolleys, which run on the rails and are propelled by coolies. A collision between a trolley and a train is treated as a serious accident, and involves, at the very least, a severe reprimand if the occupant of the trolley is technically to blame. Sometimes the only tangible evidence of a collision of this nature is the remains of the trolley, and it is not impossible to substitute another for it by means as simple as the machine-gun officer's device.

VII.

To illustrate the value of evidence the following occurrence may be mentioned. A, B, and C were three adjoining junction stations belonging to different railways. A local passenger-train, owned by railway C, used to run from A through B and C to another station on the owning line. An inspector of railway B reported that he had seen, from his house at B, an engine come from A to B, and return to A, before the passenger-train arrived. No record of the running of the engine existed at A or B, and the station-masters of these stations denied that there had been such an engine. As this appeared to be a case of running without line clear, the officers of all three railways concerned met at A to investigate the occurrence. The station-masters and responsible men on duty at A and B knew nothing about it; the guard and the driver of the passenger-train testified that they had left A to time, and passed through B and C to time. The tendency was to accuse the inspector at B of having imagined a vain thing. He could not, however, be shaken in his evidence, which was borne out by two despised 'menial' porters at B. To thrash the matter out, it was decided to examine the books at all the stations through which the passenger-train had passed to its destination. This shook the nerve of the man in charge at A, who went to the station register and inserted a remark to the effect that the engine had run to B without the train, and had returned and restarted a quarter of an hour late. The case was at once clear, and none of the perjurers had a further word to say in his defence. The driver had, through an oversight, neglected to attach his engine to the train at A, and had gone to B before the mistake was discovered. He immediately returned to A, without line clear, and brought the train to B, also without line clear, and persuaded the staff at these stations, and the guard, to omit all record of his extra trips.

On one occasion a fireman gave evidence in favour of his driver, and it was only by chance that it was discovered that the fireman had not worked on that engine on the day in question. Another witness, a signalman, fainted in the course of his evidence about a collision between an engine and a train. Medical examination proved that he had several ribs broken; and it then transpired that he had been absent without leave, and was travelling back to his station in an empty wagon that was overturned by the collision. His account of what he had been doing in the signal-box at the time was pure invention.

VIII.

An account of accidents would not be complete without some mention of the extraordinarily lucky escapes that sometimes occur. There is a legend, on more than one railway in India, of entire trains passing safely over a line from which one length of rail had been removed. Something very nearly as lucky occurred not long ago, when a troop-train, containing British soldiers, was being hurried to a town where serious disturbances had broken out. The rioters heard of the approach of the troops, and succeeded in removing a rail on a curve some twenty miles away. The night was dark, and the engine of the train, travelling at high speed, passed over the gap and rerailed itself on the other side, taking the first carriage safely with it. The second carriage derailed; but the brakes went on, and the train stopped without serious injury to any of the occupants. Other cases have been known of the engines of trains derailing and rerailing themselves without damaging anything but the permanent way.

The foregoing gives some idea of one phase of the duties of a district railway official in India. 'Joint inquiries' are invariably looked upon as a nuisance, as they take up a great deal of valuable time, and are trying to the temper; but, by punishing negligence and remedying defects, they serve a useful purpose and add considerably to the safety of railway travel.

THE DIARY OF A MEDIOCRITY.

I.

ALL diaries proper are of great psychological interest; unless they have been compiled for purposes of publication, they reflect the personality of the writer in a way which nothing else can. But there are diaries and diaries; some of them, like that of Pepys, the prince of diarists, or of Sir Walter Scott, are of absorbing interest, both on account of their reflection of the manners of the time and the insight they give into the character of the diarist. There are others, such as that of Johnston of Warriston, which may be useful historically, but which do not beguile a reader to sit up late at night with them. And there is yet another kind, which is wholly or nearly useless, in which a faithful record of every day's doings is no doubt given, but which contains no item of interest, public or private. The writer has known two men (one of them a Society star of his day, to whom all the best houses in Scotland were open) who kept diaries in which brief notes record what they did each day of their lives from seventeen to seventy, and yet the result is unreadable.

But one does not need to be celebrated, or clever, or fashionable to write a journal which may be of absorbing interest. There lie before me as I write six slim volumes, which form part of a diary kept by a 'nobody,' a poor woman who lived in Edinburgh in the first half of last century. It begins in 1825, but earlier volumes dating from 1800 have disappeared, as has another containing the years 1834 and 1835. The writer was one of those people who seem born to be unhappy, and who rather like being unhappy. She was a dyspeptic, self-centred, hysterical, and sensitive creature; deeply religious, very affectionate, but somewhat unstable in her friendships. Her feelings are always expressed in superlatives; she is continually 'deeply agitated,' 'extremely anxious,' resentful, unhappy, and despairing. If a letter of hers is not answered speedily, she concludes that her correspondent must be dead, or that something dreadful must have happened. Of course, nothing of the kind ever does happen, and there is invariably some simple explanation of the delay which relieves her mind at last. She has no 'give and take' in her constitution, and with all her real goodness must have been a difficult person to live with; yet, from all one can gather, her friends liked and esteemed her, and would doubtless have liked her more if she had been a little less exacting in her friendships, and had had, as her somewhat unworthy sister once put it to her, a little more patience.

The diary itself is not very easy to decipher. Not that she wrote a bad hand; on the contrary, it is a model of neatness. But she uses a great deal of obsolete shorthand, and crowds her pages to repletion; she has sixty-five lines to each small octavo page, so that reading her journal makes heavy demands on the eyesight. One thing alone saves it from being well-nigh unintelligible. At the end of each year she gives a summary of the diary, written in longhand throughout, though still very cramped and crowded.

II.

When we first come to know her, Margaret R. is staying with her mother and her only sister in their house in Lady Lawson's Wynd, near the High Riggs, Edinburgh. The street has long ago been modernised and widened, and none of the old houses now remain. The family were far from being in affluent circumstances. They had a slender income, partly derived from some interest they had in Jamaica, and partly from the rents of some house property in town. But this hardly sufficed even for their small needs, and a considerable load of debt had accumulated, which gave Margaret much tribulation through a long part of her life. Her father, who had been dead a good number of years, was an architect, not perhaps a very prosperous one, but with some business, as we read of his 'plans' being stored in an attic of the house. He must have died a comparatively young man, before he had time to make sufficient provision for his family. The mother was a sweet old lady of nearer eighty than seventy, with white hair and a fresh complexion which made her look younger than she was. As to Margaret herself, she tells us that at this time (1825) she had been a communicant in St Cuthbert's Church for twenty-five years, so that we may perhaps put her down as about forty-five. There is some reason to suppose that she was quite presentable in appearance, and that in her youth she had had a sweetheart, who was killed at the battle of Corunna in 1809, as the anniversary of the battle is annually noted in the journal for many years.

Her inherent pessimism displays itself in the very first entry in the diary, when, on 1st January 1825, she anticipates an unlucky year, but resolves 'to brave everything.' Although at this time a spinster of somewhat mature years, she had still a susceptible heart, and a Mr Matheson figures largely in her pages as a being for whom she evidently had a warm affection. He was a widower, and may have been connected with the business in Jamaica. Unfortunately Mr Matheson, though he was an elder in St Cuthbert's Church, does not appear to have been worthy of the gentle and devout Margaret. He was evidently a convivial soul, and fond of his glass. Indeed, he tried to prove to the lady that

the taking of liquor, far from being forbidden in Scripture, was recommended in it. He hung about her for a long time, and was a frequent visitor at the house. On 2nd November 1825 he threw his arms round her neck and 'kissed her warmly,' much to her consternation, if not surprise. A few months after he tells her he is in love with her. In December 1827 she begins to doubt his sobriety—a doubt which is sadly confirmed at the New Year, when he calls 'much the worse of drink,' to the disgust of the old lady. However, that did not prevent him from coming again in March and actually proposing to Margaret, who seems to have definitely, though with reluctance, refused him, saying that she wanted a grave, serious husband, and he was merry at times. He certainly was pretty 'merry' on one occasion, as we hear of his being seen in Leith Walk very drunk, and the little boys round him shouting, 'See the West Kirk elder!' Whether Margaret's refusal drove him to drown his sorrows still deeper in the bowl we know not, but he resigned his eldership, and soon after married some one else, and disappeared from Margaret's life.

III.

She had many friends, some of them in quite a good social position; but her chief and most intimate ally was another Margaret, the daughter or the sister of a farmer near Niddrie Castle, Linlithgowshire. These two exchanged letters with each other every month (indeed, one year the diarist says she wrote to her friend every day). This correspondence began many years before the commencement of the diary, and continued to the end. They had many points in common. Margaret Hill had worse health than her friend; she always seemed to be going through terrific crises and emerging from them safely. Indeed, she was the survivor of the two. But though they had a warm and deep affection for one another, this did not prevent frequent tiffs, if not actual quarrels. Miss Hill was not averse from giving her friend a heart-to-heart talk occasionally when she thought it would be good for her; and one summer, when Margaret R. was paying her annual visit to Niddrie Castle, things were so unpleasant that she wished she had never come. But, on the whole, dear Margaret Hill always occupied the first place in her heart among her friends. No doubt she had others; but, however enthusiastically she may write of them for a time, they fall out of favour in the end, and she begins to think she was mistaken in them. It is a pity, too, that they flit through the pages in a way which makes it difficult to identify them, as they are seldom named, being designated merely by initials. Margaret had many correspondents. She was an indefatigable letter-writer. One year she calculates she has written ninety-two letters, and though this number may not appear to us to be very large, it must be kept in view that letter-writing then was a much more serious business than it is now. The pages were crossed and recrossed, every available space being utilised, and in this respect Margaret was an adept; few persons could get so much information into so small a space. The postage, too, must have been rather a serious consideration for a person of her limited means. Occasionally she got a frank, but frequently letters were sent by the hand of an obliging friend who happened to be going to the required district.

She calls herself more than once a misanthrope, but in reality she was a kindly and social creature, as is seen from the fact that she went out 'to drink tea' as often as she could, and tea then was a very different meal from the casual function of the present day. If her head had been as well balanced as her heart was expansive, she would probably have been a very creditable specimen of humanity. But she was sentimental to a sickening degree. She confesses to having two 'idols,' a little boy called William Auchie and her own canary. The latter, after a long life, died, but was left unburied for some weeks till a suitable receptacle was prepared for its precious remains. It was then laid in its coffin, embedded in the finest white cotton-wool, with a silken shroud. A sheet of glass was put over the whole, with the following inscription: 'My canary bird, which died 10th November 1829, aged ten years and six months, and which was in my possession nearly nine years.' She wept copious tears over the body; and when some flippant person suggested that she might have had it stuffed, she said with anguish that she could not bring herself to 'throw away his little heart!'

But more serious griefs were soon to come to the poor woman. Her mother, to whom she was devotedly attached, died on 14th June 1830, at the advanced age of eighty-two. Margaret abandons herself to paroxysms of grief, describes the deathbed of her mother in harrowing detail, and gives a long account of her character. She really never got over her mother's death, and though the diary is continued for fifteen years subsequently, the time which has elapsed from that death is calculated, nearly every month, in years, months, weeks, and days, and her one desire is to be reunited with her parent as soon as possible. The year after her death Margaret had a curious subjective vision of her mother while she was at communion in St Cuthbert's. She avers that she saw her mother for a moment or two beside her, clad in robes of spotless white, and wearing a golden crown on her head. Once, at least, in after-years she rushed to the bedside of a friend who was believed to be dying, and gave her 'messages.' But the friend, in an inconsiderate way, disappointed her by refusing to die, and recovering in due time.

IV.

Other troubles were not far to seek. Her sister Jean, for whom she appears to have had a kind of contradictory affection, was half mad and half bad. She had a villainous temper, and there were frequent 'scenes.' The culminating-point was reached when it was discovered that she was drinking four shillings worth of laudanum every week, and on more than one occasion Margaret had the mortification of finding her exceedingly drunk. Of course, a woman like this should have been treated with a stern hand, but Margaret was incapable of sternness. When Jean was good—which was seldom—she was very, very good, and to the end of Margaret's life the sisters were never separated for long.

Shortly after the mother's death Jean thought of accepting a situation as a lady's-maid to a Mrs Macleod. It is interesting to note what was expected of her. In the first place, she was to lay her account for being in the same service all her life! Then she was to sleep in the same room as her mistress, and when travelling or in a friend's house, in the same bed; while on the road she would travel with the manservant in the dickey, and she was also to act as sick-nurse if required. For all these requirements the magnificent salary of eight pounds per annum was offered! Even in those days this was pretty bad, and we are not surprised that Jean did not accept the situation. Margaret records that she thinks Mrs Macleod 'very mean,' a judgment in which most of us will heartily concur.

The women had, however, to do something to earn enough to keep themselves. Margaret accepted a post at Rosneath as schoolmistress, for which she probably had but slender qualifications. She went there alone, liked the place, and her employer, 'Mrs C.,' appears to have been very kind to her—she had certainly need of patience. Margaret had hardly been there a fortnight when we find her fretting herself to death from fear that Jean would take cholera, which was then prevalent in Edinburgh, and she actually, after giving a great deal of trouble, returned home. Perhaps it was as well that she did, for she found Jean had been borrowing money and again taking badly to drugs.

In 1833 she went to stay with 'the laird' at Tipperlinn, a small village to the south of Edinburgh, apparently as housekeeper. The laird was an old man, irascible, but kind, and he hinted that at his death she would find that she had not been forgotten. Before long, however, he received an anonymous letter which incensed him extremely against Margaret and her sister. What it contained is not clear, but Margaret had a shrewd suspicion that Jean was the writer. Whether that was the case or not, the incident terminated her permanent stay at Tipperlinn, though there is some ground for thinking that in the end the old man did leave them some sort of legacy.

V.

The diary now breaks off, owing to the loss of a volume for about two years, and when next we hear of Margaret she is keeping a school at Fochabers, under the patronage of the Duchess of Gordon. The effect of change of scene and occupation is marked; she confesses herself wonderfully happy, but whether she was a great success as a teacher is doubtful. She tells us that one day twelve of her scholars left her. She had still the incubus of Jean, whose conduct was far from satisfactory. She had come to like Fochabers and the people there; but once more, from some cause or other, she had to be on the move. She was, however, fortunate enough to be engaged without any delay by the Countess of Galloway to teach school at Whithorn. On her way there from Fochabers she travelled about a little, and saw various places of historic interest. She enjoyed this little jaunt immensely, and her delight in it is rather touching, and shows how little of good fortune was wanting to make her a fairly normal being. She was, on the whole, comfortable at Whithorn, though she had some squabbles with Lady Galloway, who, nevertheless, seems to have behaved very well. Not only did she employ Margaret at the school at Whithorn, but after a time she actually engaged Jean in a similar capacity at Newton Stewart. This might have been the saving of both the sisters if Jean had only kept steady; as it was, she resisted all Margaret's ill-judged requests, made within a fortnight of her going, to come back to her, and she held out against similar entreaties frequently repeated. She said she was very happy where she was, and urged her insistent sister, very properly, to have a little patience. But this was too good to go on; after two years Jean does come back. Margaret resigns her appointment, and the two sisters continue to live together at Whithorn, Jean apparently taking a few pupils. But Margaret is as morbid as ever, and says that the only things that interest her now are the monthly returns of the dates of her mother's death and burial. Their circumstances seem to have improved to some degree owing to a legacy which was probably left them by the old laird of Tipperlinn. But the diarist was by this time getting old, and becomes more gloomy than ever. She describes herself as a poor, friendless creature; notwithstanding which, she goes on a visit to Edinburgh in 1842, and sees many of her old friends. Her end, however, was approaching; there is no index to her diary for 1843, and it is not resumed again till July 1845, when the erstwhile clear and steady handwriting becomes shaky and confused, stopping abruptly in the middle of a sentence on 30th September.

VI.

Such is a brief account of the personal element in the diary. But other features may be noticed. Some public events are recorded more or less fully. The lying-in-state of the body of the fourth Duke of Gordon at Holyrood is mentioned on 11th July 1827, and there is a long account of the execution of Burke, the murderer, on 28th January 1829. It was attended by a crowd which she reckons as of 20,000 people; windows were let at a guinea apiece, or two shillings and sixpence for 'a sight.' On the appearance of the criminal the spectators 'gave a shout of ferocious exaltation,' the shouts and yells being heard so far as Heriot's Hospital. When the body was lowered into the coffin there was a scramble for bits of rope and handfuls of shavings. The progress of the Catholic Relief Bill is mentioned frequently, and we are told that on its passing the Cameronians kept a solemn fast-day.

In 1829 Margaret goes to see two statues of Tam o' Shanter and Souter Johnny. These were probably the work of Robert Forrest, a self-taught sculptor, and were afterwards (within the memory of many people yet alive) exhibited, along with other works of his, on the Calton Hill. They seem to have created much interest in 1829. Margaret records that there were 1665 visitors on one Saturday, and altogether the attendance amounted in the aggregate to 18,000 people. The artist, whose name she does not mention, got two-thirds of the profits, and a Mr Auld of Ayr the other third.

It is curious to note that water was brought into their house for the first time on 1st March 1831, and the diarist expatiates on the delight of drinking a tumblerful from her own cistern.

Margaret was nothing if not methodical. At the end of each year she chronicles the marriages and the deaths which have taken place in her own circle of friends, and occasionally those of public characters. She was a great church-goer, and at the end of every year she annexes a beautifully tabulated list of the text of every sermon she has heard during the preceding twelve months, the church in which she heard it, the name of the preacher, and the date. The family were devoted adherents of St Cuthbert's, and Margaret had a great admiration of Sir Henry Moncreiff, who was minister there till 1828. But this did not prevent her going to other churches; we find her worshipping in Morningside Chapel of Ease, the Cameronian Meeting House, the Methodist Chapel, Roxburgh Place Chapel, New Greyfriars Church, Bristo Street Chapel, and others. More than one visit to the Roman Catholic Chapel is recorded, on one occasion to see Charles X., who was then staying at Holyrood, and the Duchesse d'Angoulême 'kiss the crucifix.' The Episcopal Chapel, too, at Fochabers was a great resort. She used to put in from one hundred and forty to one hundred and fifty attendances at church during the year; and there is a long account of the lectures given by Edward Irving in 1828, which were delivered in St Cuthbert's at six in the morning.

VII.

Margaret was by no means an uncultivated woman, and read, if not widely, at least thoroughly, many of the books mentioned being studied more than once. Among other works she mentions as having been read by her some may be noted. Chiefly, of course, they were devotional, but there are many others both of history and fiction. Among the last mentioned there are *Clarissa Harlowe*, *Woodstock*, and several others of Sir Walter Scott's novels; more serious works are the *Life of Lady Glenorchy*, Bunyan's *Grace Abounding*, Blair's *Sermons*, Flavel on Providence, the forty-eighth edition of Brooks's *Mute Christian under the Smarting Rod*, a now forgotten book then popular; in general literature, *Six Months in a Convent*, *Helen of the Glen*, Travels in England, Wales, Spain, Portugal, and Germany. She also knew some French, and read Perrin's *Fables Amusantes*, *Contées à ma Fille*, and went through Boquet's *Cours de Littérature* with her sister in the evenings of one winter. Her religious duties occupied a great part of her life, though not, perhaps, unduly protruded in the diary. She was, as has been mentioned, an enthusiastic member of St Cuthbert's Church, and must have spent many hours in the gaunt old building, with its two superincumbent galleries and its long services. Allusions to all the ministers she sat under are frequent; and when Dr Dickson of St Cuthbert's died in 1842, both she and her sister went into complimentary mourning, though they were then at Whithorn. And they wrote to the session-clerk recommending as his successor a certain 'Mr M.' (who did not get the appointment), saying they would vote for no one else. It is curious, considering the writer's extreme 'churchiness,' to find no mention of the Disruption in the diary. It is not probable that she would go 'out,' being, as she was, so much bound up in St Cuthbert's, and her minister at Whithorn, Mr Nicholson, the father of the Rev. Maxwell Nicholson of St Stephen's, Edinburgh, and grandfather of Lord Sands, was hardly the person to encourage dissent.

The diary is a pathetic little document. The writer was indeed a doleful creature, without, I am afraid, any sense of humour. She lived in an atmosphere of gloom, and thought every person's hand was against her. But she was no doubt a conscientious, worthy mediocrity who tried to do her duty according to her lights, and the record of her uneventful and drab life is deserving of study by any one who is interested in the history of a human soul.

Chambers's Journal
SEVENTH SERIES

A WORD FOR THE TOAD.

By Canning Williams.

I.

IF, as a reward for my many virtues, or as a punishment for my countless faults, I were the last man left alive, and I were allowed to choose one animal as a companion, I should not, unless my loneliness had made me melancholy (and it is conceivable that it would have that effect), select as my bosom friend a toad. I imagine the animal is capable of expressing emotion—at any rate in the spring, when, stirred by strange promptings soon after awakening from its six months' sleep, it forsakes its terrestrial haunts and seeks a wife in the still waters of a pond—but, although I have watched many toads attentively, I have never seen an exhibition of feeling, save and except a certain gleam of its beautiful eyes when it sights a bit of animated food.

Are you disposed to quarrel with me for using the word beautiful in this connection? If so, the next time you come across a toad, look carefully at its eyes, and you will agree that they well deserve the adjective. It is as though nature, conscious that she had been rather unkind to the toad as regards shape and colouring, had, at the last moment, done her best to make amends by providing it with organs of sight of unusual beauty. 'Some say the lark and loathèd toad change eyes,' said Juliet to Romeo, the inference being that such living jewels would better become the ethereal minstrel than the ungainly crawler.

A year or two ago, as I was taking an evening stroll in a dark and dismal country lane, I met a large toad similarly employed. Out came my handkerchief, and in the twinkling of an eye he was a prisoner in my pocket. I had not proceeded far towards home, when I heard a dull thud on the ground near my feet. It was my amphibian, who had become discontented with his new environment. He seemed none the worse for his fall. This time I took care to render escape impossible, and in due course he was exhibited on the table in the nursery. The children, who had not been taught to look upon the toad as a loathsome creature, were not in the least repelled by him, and when I drew attention to his gleaming orbs of gold, rapturous were the exclamations of delight. We put him in the greenhouse, and it became the daily interest of the youngest (aged three) to discover 'Toady's' hiding-place among the leaves.

One day I picked up a half-dead bee, and placed it on a piece of wood near the toad as it sat immovable, 'cool patience personified.' The insect was too weak to crawl; all it could do was slowly to move its legs and its antennæ. Presently the toad gave a half-turn to its head, its eyes seemed to grow larger and more brilliant, and then, so quick as to be invisible to my dull sight, the long, sticky tongue flashed out, and the bee was gone. There ensued sundry rollings of the eyes and swallowings, signs of intense gastronomic delight. I sought another bee, but the second one was not so dead as the first. She was placed on the feeding-board. Again the eyes rolled and shone, and again the tongue made its lightning and unerring aim; but the next instant there was a slight throat-clearing sound, and out came the bee as quickly as she had gone in. The insect had dug her lance into the gullet of her captor.

The toad does not restrict its diet to small creatures capable of being caught by the tongue; it also feeds upon earthworms, large beetles, &c., which it pushes into its mouth by means of its forefeet. It is interesting to watch the wriggling of a large worm when held in a toad's jaws, and to note the slow but sure way in which it gradually disappears and is ultimately swallowed. A very extraordinary case of a toad being discovered (by a clergyman and two friends) holding the head of a viper in its mouth is recorded in Thomas Bell's *History of British Reptiles*. 'The entire head of the viper was in the toad's mouth, which seemed completely filled in consequence, and its jaws were perfectly closed; and yet it did not appear at all inconvenienced by the mouthful, respiring apparently without effort.' Unfortunately, one of the gentlemen, after failing to separate the snake from its enemy, must needs throw them down a steep bank, and so an excellent opportunity of observing developments was lost. There could not have been a naturalist among the trio! Perhaps they sympathised with the snake; but there was no need to do so, as he had dined on toad pretty often, I should imagine.

II.

All sorts of superstitions have gathered about the toad, and the character of the harmless and useful creature has probably been more grossly libelled than that of any other member of the animal kingdom; and all because, forsooth! his shape and his warty, earth-coloured skin do not square with our notions of what is beautiful. And yet (as the Hon. Gilbert Coleridge remarks*) 'there really is something fit, and beautiful too, in the rugged brown old fellow,' with his 'wide and toothless smile' and awkward gait.

Shakespeare makes frequent and effective use of traditional and current beliefs concerning the 'venomous' toad. The very first ingredient that the witches in *Macbeth* flung into the boiling cauldron was, you remember, a toad:

> *First Witch.* Round about the cauldron go;
> In the poison'd entrails throw,
> Toad, that under the cold stone
> Days and nights hast thirty-one
> Swelter'd venom sleeping got,
> Boil thou first i' the charmed pot.

And when the gentle 'Swan of Avon' wanted one of his characters to hurl a particularly offensive remark at another, he fell back upon our inelegant but inoffensive friend. For example:

> Thou toad, thou toad, where is thy brother Clarence?
> A most toad-spotted traitor.

Milton, too, in *Paradise Lost*, makes Satan assume the attitude, if not the shape, of a toad. On Ithuriel and Zephon approaching the bower of Adam and Eve in their search for the Evil One:

> Him there they found
> Squat like a toad, close at the ear of Eve,
> Assaying, by his devilish art, to reach
> The organs of her fancy, and with them forge
> Illusions.

The idea that the toad could spit poison is one of great antiquity. Indeed, 'Aelian makes its venom so potent that, basilisk-like, it conveyed death by its very look and breath;' and Juvenal refers to toad-juice as being used by Roman ladies who desired to rid themselves of unwanted husbands:

> To quench the husband's parching thirst is brought,
> By the great Dame, a most deceitful draught;
> In rich Calenian wine she does infuse
> (To ease his pains) the toad's envenom'd juice.

For purposes of self-protection, the toad is able, by means of glands in the warts of the skin, to secrete a thick, yellowish fluid which contains a small amount of poison that is capable of causing slight inflammation of the human skin; and this is the only basis for the fantastic stories of olden days. That this secretion is a very effective protection is proved by the fact that toads are left severely alone by most predatory animals. Then, too, the creature, in common with frogs, chameleons, &c., has the power of inflating its body in order to present, when attacked, as terrible an appearance as possible—a fact of which Æsop makes amusing use in the fable of the 'Ox and the Frog,' only in this instance it was not fear, but vanity and envy, which led the frog to blow itself up until it burst. The toad's dingy skin is also a protection, as it makes the practically defenceless animal almost indistinguishable from its surroundings.

The only good thing that the ancients said about the toad was that it bore in its head a stone that was possessed of wonderful virtues, medicinal and magical. The well-known lines in *As You Like It* will at once occur to the mind:

> Sweet are the uses of adversity,
> Which, like the toad, ugly and venomous,
> Wears yet a precious jewel in its head.

Bunyan also makes use of the fable:

> A pearl may in a toad's head dwell,
> And may be found too in an oyster shell.

Fenton says: 'There is to be found in the heads of old and great toads a stone they call borax or stelon, which, being used as rings, give forewarning against venom' (1569); while another old writer observes that 'a toad-stone, called *crepaudia* (?), touching any part envenomed by the bite of a rat, wasp, spider, or other venomous beast, ceases the pain and swelling thereof.' The fable is probably based on the fact that there is a piece of shining cartilage on the head of the toad, which (if you will pardon me for quoting such words) 'represents an unossified basioccipital.'

In his *British Zoology*, published in the latter part of the eighteenth century, Thomas Pennant refers to 'the many attempts of late to cure the most terrible of diseases, the cancer, by the application of live toads' to the affected part, and he prints a detailed account, supplied by a friend, of several cases of women who were alleged to have been cured, or whose sufferings were alleviated, by this singular and unpleasant means.

III.

Toads are capable of living for many years, and, if treated kindly, lose their natural shyness. Mr Pennant gives a striking illustration of the truth of both statements. 'The greatest curiosity in it [the toad] was its becoming so remarkably tame. It had frequented some steps before the hall door some years before my acquaintance commenced with it, and had been admired by my father for its size (which was of the largest I ever met with), who constantly paid it a visit every evening. I knew it myself

* *Nineteenth Century and After*, March 1920.

above thirty years, and by constantly feeding it, brought it to be so tame that it always came to the candle, and looked up as if expecting to be taken up and brought upon the table, where I always fed it with insects of all sorts.'

There is not the least doubt that toads can exist for considerable periods without food and with very little air, but there is no truth (as Dr William Buckland proved by direct experiment) in the statement—made, doubtless, in good faith—that they can maintain life for many years while embedded in a mass of clay or in a solid rock.

Mr Edward Jesse (Surveyor of Her Majesty's Parks and Palaces), in the tenth edition of his *Gleanings in Natural History* (published in 1861), makes the remarkable statement that 'a gentleman put a toad into a small flower-pot, and secured it so that no insect could penetrate into it, and then buried it in the ground at a sufficient depth to protect it from the influence of frost. At the end of twenty years he took it up, and found the toad increased in size, and apparently healthy;' and he quotes a Dr Townson's explanation that the frog and salamander tribes take in their supplies of liquid through the skin alone, and that the moisture thus imbibed is sufficient, without any other food, to enable some amphibians to exist. It is more than probable, however, that some small aperture was left through which diminutive creatures passed.

Mr Jesse also tells of a discovery of his own which is extremely interesting. Having climbed a mulberry-tree, he found in the fork of the two main branches a large toad almost embedded in the bark, which had grown over the animal so much that it was quite unable to extricate itself. How did the toad climb the tree? Perhaps in the same way as some frogs managed to escape from an area which gave light to one of the windows of Mr Jesse's house. 'The wall of the area,' he writes, 'was about five feet in height, and plastered and whitewashed as smooth as the ceiling of a room. Upon this surface the frogs soon found that their claws would render them little or no assistance; they therefore contracted their large feet, so as to make a hollow in the centre, and, by means of the moisture which they had imbibed in consequence of the rain, they contrived to produce a vacuum, so that by the pressure of the air on the extended feet (in the same way that we see boys take up a stone by means of a piece of wet leather fastened to a string), they ascended the wall and made their escape. This circumstance occurred frequently.'

Sir Ray Lankester offers a plausible explanation of the origin of the statements that toads have been found in pieces of solid rock. He points out that the rocks in many stone-quarries are cracked, so that a narrow fissure extends through many feet of thickness of rock to the surface, which is covered with vegetable mould. It sometimes happens that a young toad is carried down by rain into one of these cracks, where it may exist quite comfortably if worms, grubs, and insects are washed down occasionally. In course of time the rock in which the creature is cribbed, cabined, and confined may be removed and broken up, when, heigh-presto! out jumps a toad. But living in a fissure on edible godsends is a different thing from existing for years in the heart of a rock or stone without food or air. It is not difficult, however, to see how the stories originated.

IV.

The male has a very keen sense of smell, which is of great assistance to it when seeking a mate. It is recorded that a gentleman, after having held a female toad in his hand, put his finger under water near one of the opposite sex, when it was at once seized and gripped in a firm embrace.

Toads also possess a truly wonderful homing instinct. Except during the breeding-season, they lead a solitary, hermit-like life; but in the spring they repair to ponds, where the spawn is produced and fertilised. This important business over, each toad returns to his or her hermitage (which may be two or three miles away), the journey sometimes occupying several days.

Like other amphibians, the toad casts its skin from time to time. After the new skin has formed, the old one becomes dry and dull-looking. Then a slit appears down the centre of the back and the abdomen, the opening becoming wider and wider until the two halves are brought in rugged folds to the animal's sides. At this stage of the process the toad, by means of its legs and its mouth, rids itself of its old cuticle. Then an extraordinary thing happens: the skin is formed into a small ball, pushed into the mouth by the forefeet, and swallowed in a single gulp!

The metamorphosis of toads is similar to that of their livelier cousins, the frogs, but the perfect state is reached later in the year; and the spawn, instead of being deposited in compact jelly-like masses, consists of beautiful gelatinous strings, three or four feet in length, the ova having the appearance of small jet-black beads. Not the least interest is taken in the eggs; they are simply left to their fate, which is often an unhappy one. In marked contrast to this is the remarkable provision which nature has made for the young of the large and grotesque Surinam toad, a native of Surinam and the neighbouring parts of South America. The back of the female is covered with a soft skin, which in the breeding-season becomes indented with small pits, in each of which a young one undergoes development. How are the eggs placed in their cradles? The natural-history books and encyclopædias tell us that the female deposits her eggs at the side of a pond, and that the

male, having gathered some of them in his clumsy, webbed hind-feet, scrambles on to his partner and neatly spreads the eggs upon her back. A few weeks ago some kindly influence led me to buy a copy of Bartlett's *Life Among Wild Beasts in the 'Zoo,'* and there I read the true explanation. The author states that in the early part of 1895 he and some of the keepers were surprised to see that the back of a female Surinam toad was covered with eggs, regularly arranged. Being anxious to discover how the eggs were placed in position, the keepers kept watch the following spring. Towards the end of April the males became lively, and repeatedly uttered their peculiar metallic call-notes. On examination two of the males were observed each clasping the lower part of the body of a female, and on the following morning one of the keepers witnessed the mode in which the eggs were deposited. It seems that the female is provided with a bladder-like oviduct which, after protrusion, is passed between her back and the underside of her partner. The male appeared to press this protruded bag, and to squeeze it from side to side, apparently pressing the eggs forward one by one on to the back of the female. Thus the eggs were spread with nearly uniform smoothness over the whole of her back, to which they firmly adhered.

In due course the tadpoles appear, but they still remain on their mother's back, and a dozen weeks elapse before they quit their living nursery and lead an independent existence. It is doubtful whether a more remarkable method of ovipositing and brood-rearing could be found in the whole of the animal kingdom.

REGINA'S AFTERNOON.

PART II.

VII.

BUT it was early to indulge in such a dream. Stealthy as Tompkins stalking a blackbird, Regina took to the staircase which, with one sweeping bend, would bring her to the main landing. Its splendidly carved old black woodwork was, of course, nothing to her in her crisis, but the mere grip of its balustrade was like a new reinforcement.

They were shallow steps, crimson-carpeted, and she mounted them almost imperceptibly. The problem of a possible connection between the thunder-clap and her human enemy ought to have given her mind some heavy food to digest, but it did not occur to her. There were thirteen rooms on that first floor, and the passages that linked them were a winding maze, with disconcerting steps down here and up there, and unexpected alternations of light and gloom even in full noontide.

The actual problem that absorbed Regina midway on the stairs was which of the two principal rooms she should tackle first—the state bedchamber in which James the First had slept (very badly, according to local history) after a ruinously expensive banquet and frolic downstairs, or the museum, in which Sir Blackstone and his father had amassed a collection of objects more or less curious that was the outspoken envy of the shire capital.

The chance of an open door settled the matter. This and an excusable shrinking from the ordeal of the museum, with its host of cabinets and cupboards, mummy-cases and imaged things, amid which her foe might screen himself and dodge from her pistol until her anxiety became unendurable. Nor this only. The museum was itself a little arsenal of weapons, ancient and modern, and of the crude but horrible South Sea island sort—enough to arm a regiment. Regina's shrinking became a shudder in the shock of this recollection as her gaze pivoted from the museum's closed door towards the wide-open one of the state-room. There before her was the historic four-poster, cheerily draped in modern pink-and-white dimity, its bed-gear covered with a precious many-hued counterpane from Persia.

She passed the threshold, welcoming the abundance of daylight from the three large diamond-patterned windows.

It was an agreeable, well-furnished room, having but two articles of furniture upon which the most exacting of present-day guests might glance a little dubiously—the four-poster itself, and——

And it was towards this other article that Regina at once crossed the thickly carpeted floor, after a roaming, keen look elsewhere.

It stood close to the wall, extending its considerable length beneath two of the windows. A rude chest of the kind one sees in old churches, for the storing of anything—from registers to candle-ends; axed out of the trunk of a great oak-tree. A thing so ponderous that a team of horses could not be warranted to stir it.

The state-room's linen and other deckings were housed in the chest, about half-filling it, and the instant Regina's eyes rested upon it she remembered that its lid, a massive integral part of it, had been propped open when she and Buckstone descended to breakfast that morning. Now it was shut. The shutting explained the thunder-clap.

This being so, why she should make straight for the chest, as if still more was to be ex-

pected of it, was a question Regina could not have answered. Enough that she did so. Her enemy might have been under the bed, behind its copious hangings, or, especially, standing his full height in the sublime Chippendale wardrobe by the opposite wall of the room. But the chest magnetised her; nor did she lift her eyes from it until she was within a pace or two of it.

And then once again fear seemed to petrify her. No sound came from the great box, but there was a sluggish trickle of bright-red fluid by one of its rusted iron clamps. Blood, unmistakably! The trickle oozed from the line of the lid's socketing into the chest, and had already formed a tiny puddle on the polished floor-space which bordered the room.

VIII.

What?—Who?—How? Time passed, and, with flogging pulses, Regina, after the first numbness of her horror, attempted to grapple with the mystery of that blood. But it was a feeble attempt. The little puddle enlarged its area, and still she stood, thrilling to no purpose. She might have gone nearer and lifted the lid, but did not. She stood thus, indeed, until something living touched her right ankle and made her start backwards with an exclamation, in a panic of new terror.

It was only Tompkins, exerting himself, most unusually, to caress her in a cat's way. His friendly overtures being thus slighted, Tompkins advanced with an air of moderate interest to the little puddle, and nosed it.

This was the limit, almost, to Regina's powers of endurance. Almost, not quite. Hoarsely she shooed Tompkins away, and had scarcely done so when a beam of joy shone in her eyes, and she rushed on to the landing.

Distinctly, amid the wind's furious harping upon the house's many wires, tuned and out of tune, another noise had come to her ears. From below. A creaking, rubbing, or scraping—no matter what it was. Thanks be to Heaven, Bucky had returned! It could only be Bucky, thus demonstrative.

Without an intrusive doubt on the subject, Regina fled down the stairs, crying 'Bucky!' several times, until she was in the hall again. Though she put her soul into them, her cries were mere whispers, carrying no farther than her own ears. But she did not know this. All she knew and cared about was . . .

But there was no Bucky in the hall. Only the armoured shape, revolting to the imagination in its tilted helmet.

The noise, however, continued, and with another appealing whisper, 'Bucky, Bucky—wherever *are* you?' Regina fled down the corridor which gave upon the old banqueting-chamber, the drawing-room, the billiard-room, the music-room, and other living-rooms of the awful old house.

She drew blank in the banqueting-chamber, a lovely apartment in broad daylight, with minstrel gallery, escutcheons, stags' heads, and other ancient fitments to match. In a screened alcove was a many-piped organ, upon which Buckstone was wont, when the spirit moved her, to play rather well. Possessed by the beckoning hope that her friend might be skittishly lying low in the alcove, Regina darted towards the organ. But she did not get halfway. The noise—behind her now—brought her to a stand. It had changed its character, and become a definite tap-tap-tap! A hollow tapping, like the beating of a wooden drum.

Motionless, while she counted eight taps, Regina then murmured wearily, 'I shall go *mad!*' And it seemed to her that the demoniacal wind snatched at the word 'mad,' and shrieked its echoes rejoicingly.

But there were still some fine dregs of courage in her, and although she had no hopes now of Bucky—none whatever—she forced herself to return, slowly, to the corridor.

'Tap! tap!'

With awed eyes, twin and true mirrors of her soul—for unearthly suggestions were peeping in her—she trembled at the door of the banqueting-hall, and sought to locate the noise.

It was not from the drawing-room and billiard-room side, but from the other, where were the Lady Betty parlour, the music-room, the library, &c. Of this little she was convinced when the tapping was succeeded by a burst as of a stubborn cupboard suddenly forced open.

Ah! For what the achievement was worth, she believed she had placed it now! It came from the room of the second door on the right—the Lady Betty parlour. And thither, with fixed eyes and shortening breaths, she tottered to her fate. Whoever or whatever it was, embodied or disembodied, she would enter. Afterwards, the Deluge—if so it was to be. Meanwhile she could still snap a trigger, if that were required of her.

This, in fact, is what she did. She saw a pair of field-gray legs, and a large blue circular spot on the trousered area just above. The man's trunk was lost in a gap of the panelling on the left side of the fireplace, under the portrait of a spectral-faced lady in an Elizabethan ruff; but his left arm, bearing another spot—diamond-shaped and crimson, this one—was as visible as his legs. The man was, of course, one of the German prisoners who were leased to the local farmers, and, regarding the blue spot as the bull's-eye to a princely target, Regina fired her shot.

A snappish yell, and the brisk plastering of that exposed left arm's hand upon the corresponding thigh, was followed by the withdrawal of the rest of the man from the gap. Regina had scored a hit. So far, well. But this was no trivial rabbit, to be put out of action by a few pellets, and she was about to fire off her second

cartridge, when the man's face came round, blazing with indignation, and—the pistol fell from her hand.

'Who the dev'—— the man had begun to storm, but he broke off very short.

With the last breath of such strength as remained in her, Regina had moaned out anguishedly, 'Oh, Bobby—it's *you!*' As the pistol fell to the floor, she also fell—into Captain Chirk's arms, which opened just in time to receive her.

POST-OFFICE STONES—CAPE TOWN.

IN the vestibule of the General Post-Office at Cape Town is preserved an extremely interesting engraved slab, one of the best examples of what are known at the Cape as post-office stones. It was discovered in 1897 during the excavation of ground immediately in front of the newly completed Union Castle Steamship Company's offices, not far from the original water-front. Curiously enough, this was the second time it had been unearthed, its first discovery being recorded in the *Cape Town Gazette* of August 1827. On that occasion, however, no attempt was made to preserve it. It was a source of interest at the time, but was allowed to remain where it was found.

The inscription is quite clear, and reads:

THE LONDON . ARIVED THE . 10 . OF M(arch)
HERE . FROM SURAT . BOUND . FOR
ENGLAND AND . DEPAR(ted) THE 20 DITTO
RICHARD BLYTH . CAPTANE 1622.
HEARE UNDER LOOKE
FOR LETTERS

It is a far cry now to the days when Vasco da Gama rounded the Cape and reached India; but from that time forward this southern point of Africa (or, to give it its original Portuguese name, Saldanha—a name which it long retained) was the welcome touching-place of the early European navigators on their way to the El Dorado of the East. The landing was of the easiest, with fresh food and water in abundance, and soon, far and wide, it became known as 'the best and cheapest place to refresh men in these voyages that ship ever came to.'

Following upon such visits, a custom arose of recording the names of the ships and their masters—with the dates of arrival and departure—upon conspicuous flat stones in the immediate neighbourhood; while later a further development of this practice was the leaving of written information concerning such matters as supplies, or the attitude of the natives, hidden beneath the stone.

But the real establishment of the post-office stones, as they came to be called, may be traced to the regulations of the East India Company, and the orders to their captains. These instructions—explicit enough—were: 'When you arrive in the Bay of Saldanha, you shall make search for letters, and in like manner, at your departure thence, leave behind you in writing, fitt remembrance of all matters useful.'

Such instructions were, of course, implicitly followed, as may be gathered from a quotation from one of these old-world letters:

'1608 July—Viewing over the stones where the ships that are bound outward and homeward do use to get their names, when we found Captain Keeling, Captain Hawkins, Captain Middleton, and divers others being passed towards the Indies, vizt. Captain Middleton in July 1607, and Captain Keeling the month of December, ditto anno.'

Another extract (28th June 1614) tells how Captain William Edwards 'found, as the custom is, advice of divers of our ships that had lately touched there, both outward and homeward, vizt. the Dragon, arriving there the 20th February 1613, departing thence the 6th March next, homeward.'

The original landing-place was at the mouth of a small stream running down from Table Mountain to the sea. In course of time, however, as Cape Town and its principal thoroughfare of Adderley Street extended, it became covered over, and not till the railway station was being extended, in 1907, was it again laid bare, when several of these post-office stones came to light—all now carefully preserved in the South African Museum, in the beautiful public gardens of Cape Town.

To turn to the stones themselves, it is not unusual to find more than one inscription upon the same stone—later records of the visits of other ships. The 'London' stone, for example, carries a second short record referring to the visit of a Dutch vessel in 1629—seven years later; while another, known as the 'Bull' stone, bears at least four inscriptions.

On this particular stone the characteristic message of 'letters under' occurs in two of these. The first and fuller runs as follows:

ROBt ADAMS COMdr. OF
THE BUL ARIVED 29 OF
NOVEMr. & DEPed THE 12 OF DECr. 1619
FOR BANTAM 10s COCKRAM CAPE MARCH
LETTERS UNDER

The second reads:

WILL VOR LETTERS 1629.

The *Bull* was a ship of 400 tons burden; while the *Will*—a contraction for *William*—was a fairly large ship for the time, and on one voyage alone brought home a cargo to the value of £60,000.

Wrapped in pitched canvas, and even further

protected by being enclosed in lead, these letter-packages were at first simply and safely enough left beneath the marked boulders; but as time went on, and rival nationalities just as often touched at this favoured calling-place, the letters did not always fall into the proper hands. The East Indiaman *Jonas*—to give one instance—touched at the Cape in July 1624, and in his despatch home to the Company from India her captain makes the following note:

'Anchored there July 19th . . . wee perceaued by inscriptions on stones that the Dolphin was departed thence homeward-bound from Surat, in April last; but could not find anie letters, though the inscription mentioned some to be left which appeared plainly to be disinterred and taken thence by the Dutch or Danes, ships of each having touched there since her departure.'

In another of the Company's ships—the *Scout*—which anchored at Table Bay (20th January 1626) the 'master's mate' was sent ashore to look for letters, 'but they were taken away befor.'

Following upon this, it would seem that certain precautions came to be adopted to guard against such interference, one at least of these post-office stones revealing a hint of a certain secret code in use by the East Indiamen. This particular stone was found built into one of the outer walls of Cape Town Castle (completed 1679). Three English inscriptions are recorded upon it, one of more special interest reading:

JOHN ROBERTS
COMMAUNDER OF
THE LESSER JAMES
AR [arrived] YE 8TH DECEM DE [departed] YE
26 . 1622 . LOVK [look] . WITH . THS
LINE FOR LETERES.

Probably the 'line' (the beginning of which is scored across the stone from the last letter of that word) took a definite compass direction of a certain known length, leading to where the letters were concealed, and quite possibly this secret code arrangement may explain why the same stone was chosen by different ships at different times, a practice at first sight so confusing. In any case, the system, even with its limitations, was of genuine service to the East India Company.

A word as to the general contents of these letters. Not only was information left regarding the local conditions of supplies, and the attitude of the natives, but as a routine practice the ships of different nationalities that had passed were noted down, with as full information as possible concerning them. The conditions prevailing in the East itself were also recorded, one missive relating how an English 'Advice Boat' had paid a hurried call on its way to England to acquaint the Company with the news of 'the injurie the Dutche had donne to the East Indie!' Then, again, trading instructions were left by homeward-bound ships for the supercargoes, or 'Cape Merchants,' as they were called, outward-bound.

Generally speaking, the lettering of these stones varies only in quality. There is no attempt at ornamentation or extraneous embellishment—with one exception, and that in an interesting direction, for upon the stone recording the visit of the ship *Thomas* (one of a small company of East Indiamen, outward-bound in 1611) there are the distinctly cut Masonic emblems of the Square and Compasses—the first indication of Freemasonry found in the Cape of Good Hope.

Not after 1652, the date of the foundation of Cape Town by the Dutch, are the records of passing ships found graven in stone. No longer were the venturing mariners directed to 'looke for leteres' hidden beneath such stones. The old order gradually passed away, an establishment ashore handling the letters, the forerunner of a regular postal service.

'Neither snow, nor rain, nor heat, nor gloom of night stays these couriers from the swift completion of their appointed rounds.' These lines, beautifully carved on the frieze of the new post-office building in Eighth Avenue, New York, may be accepted as proclaiming the creed and principle of the postal system of the world. May it not be conceded that in the evolution of this great scheme the 'Post-Office Stones' of the Cape, in their own simple way, played a part?

THE MOUNTAINOUS MR NEUBURG.

CHAPTER IV.—*continued.*

II.

FOR some minutes Clement struggled with the pain caused by the sandbag blow on his head, and the suffering inflicted by the ropes on his stiffened limbs. Unlike a good many people he had read of in fiction, he woke with a clear knowledge of how he came to be there. He did not have to fumble about in his mind; he remembered everything that had happened up to the moment when the sandbag had knocked him senseless. He knew quite well that he was lucky, that the mere fact of being alive was an unexpected good fortune. What he did not know exactly was where he was, and, of course, he did not know why he was there, and what were the intentions of Mr Neuburg and his blackguard gang towards him.

At first he thought he was in a cellar, but in a minute his ears caught the deep booming of a distant steamer-siren. That told him he was

above ground, for in a cellar he would not have heard it. It told him, too, that he was still near the docks. Probably he was in the same house. He listened. He heard a sudden puffing, a rattling and clanking of coupling-irons. That was a goods-train at the docks—*and the sound came from somewhere below.* Then he heard some kind of lorry passing—and the sound floated up to him. He was, then, high up in a house, high up in the house of the glue-maker in the Sault Algonquin.

He was in an attic-chamber, he thought. An unused one, a lumber-room, perhaps, for there was a stuffiness, a staleness, in the air about him. He rolled over a little to the left, and hit some sort of big bundle. He rolled a little to the right, and was checked by a packing-case. Yes, it was an attic, a lumber-room. The movements had caused Clement acute pain, for his bonds, already stifling circulation, had pressed into him. He had to remain quiet until he recovered strength. As he lay he wondered how long he had been unconscious. Had it been minutes or hours? If it had been hours, what had happened to Heloise? . . . That woke him up stiffly. He was caught, a prisoner, and that gang of rogues could do what they liked with her unhindered. If he had been unconscious hours, it might be morning; they would have had time to do something. He looked about wildly, seeking some window that would tell him if it was dark or light. He could discover nothing. That might be because it was yet night; or it might be that the window, if any, was blocked up; lumber might stand between him and it. With an almost savage output of will he wrenched himself to a sitting position; then, almost shouting with pain, he sat getting strength for another effort. He glanced round. He saw nothing. He listened for sounds in the house. There was not a sound. Then, with an old schoolboy trick, he managed to double his aching and pinioned legs under him, and with a quick jerk raised himself to his feet. The effort had been too exacting. He was in an agony of pain. Pain overwhelmed him. He swayed; he fell. But as he fell he saw something faintly blue-black against which the heavier black of lumber was silhouetted. As he fell, swooning again, he muttered, 'A window. . . . And still night—still night.'

He was forced back to consciousness by the frightful sensation of blood recirculating in wrists, knees, and ankles. He writhed and moaned. An oath sounded at his side. Something soft and yet heavy was flung over his head. Something snapped on to his wrists. In pain, but alert immediately, Clement struggled to throw the thing from off his head. There was a shuffling movement; steps thumped quickly across boards; something was flung down. He got whatever it was off his head. He just had time to see the legs of a tall, thin man flash out of the door, and the door slam. He heard a strong lock snap home. Louis, the glue-maker, did not wish to risk identification.

For the next ten minutes Clement was grappling with the agonies of returning circulation. As he rocked and nursed his exquisitely painful limbs he smiled grimly at the way the heroes in the cinemas overcome this problem. He had seen bound men slip out of their bonds and skip into a new adventure without even pausing to chafe a wrist. He wished his own case had been as easy and as painless as theirs. Yet even in his condition he was able to take stock of his new circumstances.

In the first place, he could see. There was a pale, thin light coming in from beyond the piles of oddments that strangely littered this attic. It was morning, then, and daylight was shining through that window. In the next place, his rope bonds had been taken off him. His jailer, no doubt, felt that the former tight trussing would spell injury, and also that, trussed up like that, it would be difficult for him to feed—and the jailer wanted him to feed, for a jug of water, some meat, and some bread on a plate had been placed near Clement. That meant that, for the time being anyhow, the rogues did not want him to die.

Still, they intended him to remain a prisoner. Round his wrists was a pair of old handcuffs—that was the snap Clement had heard. Round his ankles was another pair. Connecting this pair with a heavy old stove in the corner of the room was a long, thin chain, both ends padlocked. Clement also saw that the thing that had been flung over his head was a bundle of sacking. He saw, too, that the ropes which had bound him had not been taken out, but had been flung down near the door. He guessed from these facts that he had regained consciousness before his jailer had finished his job, and the fellow, in order to avoid being seen, had got out of the room as quickly as possible. And hurry quite often means carelessness. Clement flashed over himself an instant survey. In a minute his right hand was free.

Hurry had done that. The handcuffs on his wrists were of a certain make. They were made to take three sizes of hands. They were ratcheted so that by pressing the loop farther into the lock any wrist from the large to the small could be accommodated. In his hurry Clement's jailer had been content just to snap the first ratchet home. That would have sufficed to hold a large wrist—Clement's wrists and hands were small. It was not much that Clement had his right hand loose, for he was still hobbled and chained, but it was something. Man may do much with a free hand.

In fact, Clement proceeded to do it. Finding that the rest of his shackles resisted preliminary attacks, he left them alone. He surveyed his prison. The length of his chain allowed him to

get close to the door, but not up to it. And it was an intimidating door. It was made of stout and solid timbers warranted to defy his strongest efforts even if he were free. He knew that if he could not get through that door by guile, he would never be able to break through it. He turned to the window. He found—and here was where his free hand helped him—by removing bits of lumber, and by stretching full length on his face, he could get his eyes to within a foot of the window-panes. It was a queer window, of the type known to architects as a 'lie-on-your-stomach.' That is, it began on the level of the floor, and rose to where the roof-slant rested on the house wall but two feet above. Clement observed that it was meant to open inward, though apparently it had never been opened; had, possibly, been screwed up. But the fact that thrilled him most about it was that the top of some structure rose to the level of its lower panes. From the appearance of that structure, from the position of the window in the house, Clement felt certain that the supporting uprights of the fire-escape ended there.

III.

Clement lay on his stomach staring out of the window for a few minutes. He could see, but only faintly because of the grime, the face of the cliff rising up to the builder's yard in which he had hidden yesterday (he hoped it was only yesterday) to survey this very house. Indistinctly he saw men moving about in that yard. That meant that the morning was fairly well advanced, a fact of which he had already been unpleasantly aware by the sound of road traffic, the clang of tram-bells, and the like coming up to him. What the time was exactly he did not know. His wrist-watch, together with his pistol and the contents of his pockets, down to his very pocket-handkerchief (Mr Neuburg was not the sort to leave anything that might be used as a signal of distress, even in the hundred-to-one chance of Clement finding an occasion to use it), had been taken. He did not know the time. He only knew that the day was here, and was advancing, and that Mr Neuburg and his fellow-rogues must already be carrying out their plans with regard to Heloise.

What those plans might be he did not attempt to conjecture. But he knew that Henry Gunning must have been found, because Siwash Mike had come here to report. Whether Henry Gunning was sober and tractable, or still drunk and rebellious against the gang, he did not know; though he fully understood that upon her boyhood lover's condition would depend whether Heloise went to him at once, or remained here in Quebec for a few more days. He prayed that Gunning was in no condition to see the girl, and that she might remain.

For he meant to get out of this place, and go to her, whatever the cost. He had learnt enough of these scoundrels to recognise that he was the only one in Canada who stood between her and most terrible dangers. He, and he alone, could rescue her, and—even apart from his own feelings for her, arguments enough in themselves—he was determined to save her.

The first problem to face was to get out of this place. He went and sat down beside the food, and as he ate and drank he thought the matter out. As things were now, chained as he was, he might be able to get away by creating a disturbance. He could, for example, shatter that window with a pole, throw things out of it, make any amount of noise. He could beat on the floor, or hammer through the tiles of the roof with a pole. He could make it obvious to outsiders—the men working in the factory even (they couldn't all be in the gang)—that something was wrong. He would attract attention. Clement would not have stopped at burning the house down if it would have effected his rescue, but he rejected this plan. It would attract the attention of the gang before it attracted the attention of passers-by or workmen, and the alert scoundrels would see to it that he gave no more trouble of that sort—and that would be the end of his attempts to help Heloise. The end of himself, too, no doubt.

The next plan was to choose some sort of effective weapon from this lumber, and wait the return of the jailer, stun him in a surprise attack, take the keys of handcuffs and padlocks from his pocket, and, by so freeing himself, escape. This plan was rejected because it was more than likely the jailer would not visit him again that day—the ample supply of water and food seemed to bear this out—and that meant a whole day wasted. It was a plan, however, that could be kept in the background ready for use, in case the jailer did come up to the attic at any time. An argument against it was that even a surprise attack might mean a scuffle or a yell, and another rogue—Siwash, maybe—would be warned, and ready to deal with him as he went downstairs.

The third plan seemed the most feasible, and it also seemed to promise quickness. It was, briefly, to get his fetters off, to get himself out of the window and down the fire-escape, and up the cliff by the way he had reconnoitred yesterday. This Clement set himself to do.

First, there was no getting away from the stove to which he was chained. It was too heavy to lift. He must cut himself free from it. He saw in the attic a box of rusty iron oddments—and found it was out of his reach. Prowling round softly, he found the lid of a box that was loose. By catching the batten that held the lid-planks together on the side of the box of rusty iron, and by exercising patience, he managed to draw the box within his reach. It was the oddest collection of scrap, but one of the first things he found was a staple. He inserted this into the tight loop of the thin chain where it secured

his ankle handcuffs. He twisted it tourniquet fashion. He had to exert all his strength; he had to endure the wrenching at his ankles by the shackles; he had to try and try and try again. But in the end he succeeded; by slow degrees the strained chain gave, and, after a time, a weak link yielded and parted.

He was free—but only free to hobble. There were yet the handcuffs about his ankles. He examined them carefully. They were old, and their undoubted strength seemed to be weaker in the link against the left ankle, which was rather deeply rusted. Clement tried to prise this link apart, but the wrenching caused by doing this gave him so much pain that he had to stop. But his luck was not out. As he searched carefully through the scrap-box he came upon a hack-saw, and not a bad hack-saw, and, though the steel of handcuffs is stolid stuff, Clement prayed that the rust had had such an effect on the metal that the saw would make a good job of it. His prayer was answered. The task took time, and it was difficult—those who have tried to saw through a ring that is not only tough but movable will know how hard it was—but in the end he succeeded. He cut through the ring, with his staple he forced it apart, and, although the irons were still round his limbs, he was not fettered. He could walk with a stride as a man should. Rolling down his socks, he pulled them up again over the handcuffs, and got rid of the slack chain on the right ankle by hooking it in his suspender. Then, having found a chisel, which would do instead of a screw-driver, he attacked the deeply rusted screws of the windows. He had just, after a terrific struggle, got the first embittered screw out, when he was startled by an uproar about him.

First one and then another and then another siren began to roar, until it seemed to him Quebec itself was made up of sirens let loose. And amid the sirens he heard the clangour of bells. He started back, wondering what had happened—a fire, a riot, a revolution. Then the truth dawned on him. The 'knock-off' was sounding in a score of yards and factories. It was the midday break.

Two thoughts flashed into his brain. The first was that a whole morning had gone by and he had accomplished nothing towards saving Heloise from those rogues; while the rogues—what might they not have done? The second was that, this being the meal-hour, he might expect a visit from his captors, a desperate eventuality that must be faced desperately. He found a very useful piece of iron to use as a club. He went and lay down where he had lain all night, hiding his feet, but arranging the chain so that he appeared still a captive. With his iron club hidden but ready, he awaited the coming of the jailer. He waited an hour. He waited until the sirens sounded again and work was recommenced. He wasted another hour. Nobody came. The tall, grim house was implacably silent. Clement listened. Not a movement came up to him. With an angry exclamation he rose and attacked the window.

IV.

In half-an-hour the window was open. He looked out. Nothing was showing in the yard beneath save the steady puff-puff of the steam from the factory exhaust-pipe. He stretched his hands out to the nearest post of the fire-escape. He clasped it. On his stomach—all the window would allow—he began to wriggle out. It was not a pleasant or an easy task. To wriggle out, shoulders first, over a drop of six storeys, with nothing more to rely upon but the grip of one's hands about a thin iron pole, demanded nerve. Clement, trying not to think what would happen if he suddenly slipped, wriggled. It was soul-chilling. There was one moment when he seemed to stick hopelessly—the greater weight of his body outside hanging on his straining arms, and his feet stuck inside, refusing to come out. There for an agonised moment he hung swaying, helpless. He made a giant effort. The thin iron of the fire-escape support creaked and appeared to bend toward him. He heard the structure groan. His feet came away suddenly, and his knees and thighs struck the iron pole with excruciating pain. But the instinct of preservation caused his limbs to act almost, it appeared, on their own initiative. Just as his hands seemed bound to be torn loose by his weight, his legs circled the iron support, and gripped. He slid downward. In a moment he was crouching on the top platform of the fire-escape, behind a rain-water barrel.

He remained there for a few minutes, regaining his breath and his nerve, surveying the side of the cliff to the up-town of Quebec up which he must presently go. Then he stood up, looked downward—and saw a man on the flat roof beneath the fire-escape.

The man had come out on to the flat roof from the window of the house that was flush with it. He stood, a slim, lithe figure, gazing idly about him. He was occupied with nothing more significant than the American after-lunch exercise of picking his teeth. He stood there indecisively for a full minute, and Clement, again behind the rain-water barrel, watched him. He knew who the man was. It was Siwash Mike. He hoped Siwash Mike was one of those who liked to take an afternoon siesta on his bed.

Siwash Mike stood there, easy, feeling, no doubt, that the world was a good place to live in. Then he apparently decided what he was going to do. He turned and re-entered the house. Clement, thanks to the stealth afforded by his rubber-soled shoes, was down another floor on the escape by the time he emerged again; that was the fourth floor, through the

window of which Clement had seen Siwash himself enter this house yesterday.

The action of Siwash was now not so satisfactory. Siwash was dragging behind him a deck-chair. Siwash—it was horrible to see it—had under his arm a bundle of magazines with highly coloured covers. Siwash was going to make an afternoon of it on that roof. An afternoon of it—and Clement must leap from the escape to that roof, and cross it, in order to reach the cliff. Clement, that is, was pinned to the fire-escape as long as the half-breed barred his escape by that roof.

It was a bitter moment.

But Clement was not one of those who willingly allow anybody to bar their way of escape. He meant to get across that roof and up that cliff. And, what is more, he had to do it quickly. He could not afford to waste any more time away from Heloise's side. Indeed, he himself dared not waste time here; at any moment some one might go up to the attic, find him gone, raise the alarm.

Raise the alarm! The thought flashed through Clement's mind not with a thrill of anxiety, but with the thrill of a happy idea. With his eyes on the now reposeful head of Siwash Mike, he felt the jalousies of the window behind him. As yesterday, they were unfastened. He opened one, slipped his hand in—yes, the window was wide open also. In another moment he was inside that window, and had closed the jalousies behind him. Through them he could still see the half-breed's head bent over a magazine. He turned. Before him were the stairs, one flight going upwards towards the attic, one descending steeply into yawning darkness. He went to the head of these. With his hands he made a trumpet about his mouth. He opened his mouth. With the full power of his lungs he yelled, 'Siwash! Siwash!'

He nipped back to the jalousies. He looked down at Siwash Mike. The half-breed was standing, glaring towards the house, his body tense and alert. Clement nipped to the head of the stairs. He yelled again in a tone of terrific alarm, 'Siwash!'

He heard a tumult below. When he got to the jalousies Siwash was no longer on the roof. But in a flash of seconds Clement was. He was down the escape, had swung from the escape to the flat roof, had dashed along that roof, and had leaped to the ledge of the low cliff. He was three-parts up the cliff before any sign appeared in the house of the glue-maker. Only then did the fierce face of the half-breed appear at the little window of the attic.

The face appeared, scowled ferociously, then the lithe right arm shot out. The automatic in the hand came down, sighting on Clement's climbing figure. Clement shut his eyes and felt sick. He was a mark that could scarcely be missed.

Nothing happened.

He opened his eyes.

Siwash's face was turned away from him; he appeared to be arguing vehemently with some one behind him in the attic. As Clement looked, a long, thin arm with an incredibly bony hand stretched itself past Siwash's shoulder, and clutched avidly at the automatic pistol. Clement did not waste time then. He was up the remainder of the cliff as fast as his best climbing could take him. He was through the builder's yard at a run, though a man yelled at him to know his business. And in a near street he caught a taxi, and went to the Château Frontenac as rapidly as petrol could carry him.

As he went into the lobby he was stopped by the porter. 'We've been looking for you, Mr Seadon,' the man said—'looking for you everywhere. A lady was asking for you.'

'A lady!' cried Clement, stopping in his stride. 'What lady?'

'Oh, the one that left this morning,' said the porter.

'The one that went this morning?' echoed Clement stupidly.

'Yes, the one that left for Montreal.'

Clement glared at him. 'You can't mean Miss Reys—Miss Heloise Reys—who was here with a companion?' he cried.

'That's the lady I mean,' said the cataclysmic porter. 'She was asking for you right up to the moment she left.'

(*Continued on page 242.*)

SOME EXPERIENCES IN THE GIBRALTAR CAVES.

BRITONS are accustomed, probably owing to the tradition and the inherent conservatism that distinguish the Anglo-Saxon race, to regard Gibraltar as a fitting symbol of the strength and solidity of those ties which bind together our widespread Empire. Undoubtedly, to the casual or passing observer, the rock appears an immense, compact mass; but in many places the interior is very like a sponge, being honeycombed with caves and passages, and although certain of these recesses have been constructed by the authorities, yet by far the greater number are the work of nature. Of the latter, some have outlets on the surface of the fortress, and consequently, for a certain distance, have been explored; but others are purely internal, and their existence is brought to light only when they are accidentally broken into by excavating-parties.

The caves vary considerably in size and shape;

whilst the smaller may be mere fissures between rocks, the largest are comparable to halls, and in cases have long, winding passages leading far down into the interior of the rock. Those which are near the base are much used as Government storehouses, but the higher and more inaccessible served at one time as breeding-places, and now serve as homes, for the monkeys.

A few facts concerning these singular animals may be of interest. Their chief claims to fame are two: primarily, they are the only specimens of their order to be found in Europe; secondly, they have no tails. From the strong resemblance they bear to the Barbary apes, it would seem that originally they came from northern Africa, but how actually they arrived on the rock is not definitely understood. Their habits are dirty, and if the garrison did not afford them its protection, extermination would speedily follow. A very favourite rendezvous of the monkeys is the southern cemetery of the fortress, where lie buried many of the British dead from Trafalgar. It is not uncommon, on looking over the graveyard wall, to find one's self confronted with the rather repulsive sight of some half-dozen apes, each squatting upon a tombstone, nibbling nuts or gibbering amongst themselves. But with advancing years their numbers have steadily decreased.

Probably of all the caves St Michael's is the most extensive, and unquestionably it is the most famous. The entrance lies about half-way up the western face of the rock. In bygone days so numerous became the fatalities to members of the garrison bent on exploration that the authorities erected a guardhouse, at which a body of soldiers is still maintained, and none may now proceed into the cave unless accompanied by one of them in the capacity of guide, whilst a military pass is essential. One afternoon in the summer of 1910 I arranged with one of the soldiers to show me over St Michael's. Taking with us ropes, candles, and a few mountaineering requisites, we passed through the iron gate at the entrance, to find ourselves in a large hall. The far end was enveloped in pitch darkness, but, as far as I could see, the roof was supported by a single large central pillar of rock, with several smaller ones at intervals round about. The floor sloped downwards at a rapid angle, with here and there large boulders. To maintain a foothold was a difficult task, for by the continual percolating of water from overhead, and the wear of many feet, the rock had become smooth and slippery, a condition which, added to the sharp descent, gave little or no grip for the feet. Lighting a couple of candles, we could just distinguish the bare outlines of the back of the hall; before us and on either side the remnants of what must once have been a grand spectacle. Endless successions of visitors had, however, despoiled it. Each individual had, quite naturally, endeavoured to carry away a memento of the scene; stalactites and stalagmites had been indiscriminately broken off; only the bare stumps remained, casting long shadows in the candle-light. Though the air was cool and damp, yet the silence, broken only by the monotonous drip, drip of the water, was oppressive; the voice echoed back with a ghostly, hollow sound. The whole atmosphere of the cave stirred a feeling of awe, and, try as I might, I could not prevent the grim legends associated with the dark interior from flitting through my mind.

Picking our way cautiously between the boulders, we followed the pathway to the opposite side of the hall, from which a narrow passage led into the bowels of the rock. Along this damp and winding corridor we climbed, first over rocks, then stepping or jumping from one to another, then squeezing through narrow apertures, till we came upon the 'Dead Man's Drop,' so called from the heavy toll it has exacted from intrepid explorers. It is a vertical shaft, rectangular in section, whose bottom has never been reached, or even its depth ascertained. Many there are who have attempted the perilous descent. Some have returned to tell of sheer sides and little ledges; others have disappeared, leaving not a trace behind.

Legend has clustered thickly around the impenetrable darkness of this dismal pit. Years ago, it is said, two officers of the Royal Engineers attempted to map it, but though taking all precautions and being supplied with proper equipment, yet they never returned. Careful search was made, but their bones have never been recovered, and to this day their fate remains an unsolved mystery. A popular story is that the 'Dead Man's Drop' connects up Gibraltar to northern Africa through a subterranean passage running under the bed of the Strait, and is the means by which the monkeys obtain access to the rock. It is difficult to comprehend how one may determine the ultimate destination of the 'drop' when its bottom and depth are unknown, and how even a rock ape could climb its sheer, inaccessible sides.

Continuing our road, we finally arrived at the 'sixty-foot drop,' another large rock fissure. Wide at the top and narrowing towards the bottom, it is in form like an inverted cone, and the most dangerous of all the pitfalls to be found in the cave. The slanting sides make climbing difficult and approach a matter demanding extreme caution. Fixing a rope, knotted at intervals of about a foot, around a convenient boulder, we descended, hand over hand, the guide leading. On the way down we could hear the peculiar noise of the worms with which the pit abounds. When we reached the bottom another aperture presented itself, and pursuing its course, we found it to be another passage. To push our

way along it was tiring work, for it was but a series of crevices between large rocks, and to pass along it was like threading one's way through the stones of an immense cairn. The candles were beginning to burn low. To have lost their light would have meant certain disaster in the darkness, and as the exploration of the passage had not so far yielded any results which might give a clue to its ultimate end, we retraced our steps to the foot of the 'sixty,' and commenced the ascent. Our previous exertions in scrambling over rocks had been severe, and this, coupled with the slippery sides of the 'drop,' affording little or no foothold, made the work of ascending an exhausting task. I succeeded in reaching within ten feet of the top, when, my strength spent, I felt that I should have to let go and join the already long list of St Michael's victims. Fortunately, however, the guide, who had preceded me, perceiving my distress from above, called out 'Hold on,' and I was drawn up, looking a rather sorry sight in my bedraggled ducks. The incident unnerved me, and I confess that it was with a feeling something akin to relief that I found myself once again in the open air.

The entrance-hall, with its surrounding grottos and crevices, constitutes a scene that figures in the pages of history, for it was from these dark recesses that the Spaniards issued in the last disastrous sortie that ended their final attempt to take the rock by surprise. During the last siege a party of three hundred, taking the last Sacrament, vowed to retake Gibraltar or die. Under cover of darkness a landing was made on the eastern side. Born mountaineers, the Spaniards scaled the precipitous eastern face, trusting for guidance to perilous goat-tracks. Reaching the summit, they succeeded in descending the western face, and in gaining the entrance to St Michael's without detection by the British sentries. All the following day they slept far back in its passage-ways; but next night, sallying forth, they were discovered and cut to pieces. Ever since, right up to the present day, a guard has been stationed at the entrance to the cave.

At Gibraltar difficulty is often experienced in finding sufficient accommodation for such perishable commodities as food and ammunition, and where adequate room cannot be found, it is provided by the utilisation of large spaces cut into the rock. During the construction of one of these storage centres the working-party broke into an internal cave, and it was my good fortune to be invited to view it in its virgin condition. Taking with us an arc lamp and a long lead of electric cable, we climbed up through the roof of the excavation, and found ourselves in a long tunnel, along which we proceeded, exercising great care. Travelling, so far as I could judge, in a horizontal direction for the space of fifty or sixty yards, the path suddenly narrowed, and in front appeared a large black patch. On our approaching closer, it resolved itself into a circular chasm, some thirty or more feet across, in many ways comparable to the 'Dead Man's Drop,' but much larger. Its darkness was profound; not even by throwing down stones could we obtain any idea of its depth. We could not hear them hit the bottom, only the sound, gradually growing fainter and fainter, as they struck the sides and rebounded.

At the side of the passage the path was not more than a foot wide, and along this, our backs to the wall, we carefully made our way, realising that the first slip would mean disaster. From the other side the floor rose steeply, evidently parallel to the face of the rock. In the illumination of our lamp, the sight was indeed beautiful. At intervals stalactites and stalagmites had formed from floor to roof, of ten to twelve inches in diameter. The white stone, reflecting the light, imparted to the cave the appearance of the interior of a Gothic cathedral. To secure a better result we switched off the arc and ignited a magnesium glare. It is difficult to convey by words the striking effect of the dazzling white flame. The foremost columns scintillated and flashed as though set with diamonds, the sparkling mass gradually receding, first into shadows, then into blackness at the far end, altogether a wonderful gradation of light and shade.

The climb to the top occupied about twenty minutes, during which the walls converged to a wedge-point. We concluded that our journey was at an end, when, glancing round to the left, I observed a small aperture, and scrambling through without difficulty, came upon a second cave, much more diminutive than the first. No more than three feet in height, its roof was covered with hanging stalactites, innumerable stalagmites standing up from the floor. The fact that all were intact, not even one being broken, convinced me that this portion at least had never been explored. I must acknowledge that the temptation to retain a souvenir was irresistible, and I crawled back, the happy possessor of a small piece of a stalactite, some three inches in diameter, a memento which now adorns my sideboard as a model of Gibraltar's 100-ton gun, mounted on a mahogany carriage. The wood is blackened with age and exposure. It is a piece of a ship's keel, discovered deeply embedded in the mud when the docks were being built, and believed to have been a portion of the hull of one of the vessels in which the Moors invaded Spain nearly twelve centuries ago.

THE VALLEY OF BONES.

A TALE OF EAST AFRICA.

By E. CHARLES VIVIAN.

I.

I SPEAK, you see, good English, yet my father was Portuguese—it is long since he died. You would that I tell you my story of the valley of bones, the story at which some men laugh, saying that from Delagoa Bay across to Benguella in the west it is known, and yet no man has ever seen the valley. But that is wrong, for when I was yet a boy I saw the valley, and that is my story. They have for it other names, I know; but to me, since I saw it, it has ever been the valley of bones, dry and dead and shining bones, great bones, and horrible. A guarded valley, guarded as is no other.

As a child the story had been told me. I remember when the slave-hunters came down to the coast with their chained gangs to go aboard the dhows, before the seas were swept clear of them. My father—no, he was never a slaver—ran transport inland from the bay, up to the edge of the fly country and beyond, and as a child I used to go with him, so that I learned to run barefoot in the bush, and to hunt—they who know me will tell you that there have been few better shots with an express-rifle, and in the time of which I speak there was no licence to kill big game, but the elephants roamed the land in herds, up to northward of the Zambesi marshes, in the districts I knew. And there was eland, and giraffe, and rhinoceros, and hippo, all for the hunting. As for the lions, there are lions yet in plenty, if you know where to go; and I tell you that I had rather hunt lion and find him in plenty than spoor rhinoceros or elephant.

I was yet a boy, I tell you, in that trek in which I came on the valley of bones. A boy, but I knew how to handle an express-rifle, and had gone up-wind after lion and shot him, many times, mostly in the hour between the lights, at the drinking-places of the bush. And once, with my father, I had gone out for elephant, a time when we shot two, for it was a trek in which we had many bearers with heavy baggage, and we had to feed them. When we shot the elephants the bearers were very hungry, and they called my father '*koos y umcool*,' which in their language means 'great chief.' For in those days a good hunter was a great man with the black 'boys,' from the coast inland.

We had gone—I cannot tell you how far inland, for your maps I do not know, having ever hunted and travelled in this our Africa by the instinct that comes of much living in the bush. We were north from the Zambesi valley, and there comes a point where is a range of mountains running down from the north, and settling to little foothills and tumbled ground before it falls altogether to the level of the river valley. Our course lay northward, away from the river—my father had been that way before, and knew his route, though it was wild country, where no white man came from one year to another. In that time much of the country that is now planted and settled was wild, but as for that part of which I speak, it is wild yet, and ever will be, I think. For the soil is thin and poor, and the grass is like an old man's beard, and the bush is starved; here and there is a spring, and the springs are nearly a day's journey apart; there is rock outcropping through the soil—a poor land, worth no man's effort. If you know it as my father knew it, you may find a line of springs that will give water to take you through; if you do not know it, you may very easily die of thirst, for it is far to the north of the great Zambesi River—how far I cannot tell you, for I never went thence south to the river.

On that trek there was my father and myself, and another boy like me with whom in those days I used to hunt and shoot, a boy named Joaquin Hurtado, whose father, like mine, was Portuguese. In that arid land through which we travelled with the bearers there came a time when provisions ran short, and then it was that Joaquin said to me, 'Let us go out and shoot elephant, to keep the bearers in heart.'

My father laughed. 'As if any of the wild would come to land like this!' he said. 'We shall find no elephant till we come to better country.'

But Joaquin persisted. 'I saw elephant spoor this morning,' he said, 'and that but a few miles back in the bush. It was fresh spoor—there was a patch of soil between the rocks where the footfalls showed clear and fresh. Let us go.'

'It is madness,' said my father, 'and in two days' time we shall come on good game country. I can feed the bearers till then, thinly, and promise them meat when we have won through.'

Still Joaquin persisted. 'If you will let us go,' he said, 'Pedro here'—that was me—'and I will bring back elephant meat.'

We had travelled early that day, and this talk came in the afternoon. My father looked up at the sun, still three hours or more from setting, and he knew there was a moon near on full that night.

'If you will be back not more than two hours after sunset, you may go,' he admitted, 'though I know it for the errand of fools.'

II.

With that grudging permission we set out. We went back some way to the east, taking with us our express-rifles. We came, at last, on the spoor that Joaquin had seen as we marched, and it was as he had said, the fresh spoor of two elephants, both very big, by the marks in the soil. They pointed to the north, toward the hills, and the wind was from the north, as should be, for it is dangerous to track any of the wild down-wind.

We went as those tracks led us, up-wind and to the north. It was as if one followed a great cart-track, simple spooring, and we saw that the great beasts had travelled easily, yet as with a purpose, for even where there was vegetation they might have liked they had not stopped to feed. The mighty hoof-marks took us on and on, and at times we stopped to make certain of the direction of our camp, so that it was sunset when we were rounding the base of a little hill at the eastern edge of the range.

'They go very steadily,' I said to Joaquin, 'and the marks may take us many miles.'

He, too, had begun to wonder at the straight way the elephants had taken, as if they were men on a journey, and not beasts in the bush. 'We will go on for another hour,' said he, 'and then, if we do not come up with them, we will go back to camp to be called fools by your father. Yet, when I saw this spoor this morning, I was certain that it was not two hours since the elephants made it.'

The track led us round the base of that small hill, and beyond it to a broken succession of heights and crags. There was a little stream that came out toward us, and the spoor led up beside the stream, up a valley that became more and more shut in. There came the darkness that follows rapidly on sunset in that land, and the wind, instead of falling with the sunset, came straight and cold into our faces. The moon hung low, so that long shadows were thrown across our way. And we followed the stream until it was nearly an hour from the going down of the sun.

'We will go back,' I said to Joaquin.

As if to answer me there came the trumpeting of an elephant, and others took it up, so that the valley in which we walked rang with their noise. I looked to the breech of my express-rifle, thinking no more of going back.

'It is a herd,' said Joaquin—'a big herd.'

We went on, very cautiously. Before us, as we went by the stream, the valley narrowed to a sort of cleft, shut in by crag walls, narrowed still more to a gateway between the crags, and what lay beyond the gateway we could not see until we had come to it and passed through. Going very silently, we came to the gateway—for so I choose to call it—and the night wind blew cold in our faces all the time. In that place where the cliff walls fell away, and the valley widened out, we stood—or should I not say we crouched?—to gaze.

Before us was the level floor of the valley, and the crag walls shut it in on every side. There may have been another small opening at the far end, which was so far away as to be but a shadow in the moonlight, but I think the valley was locked by the rock walls, save for this one entrance. For at its far end the mountains—the true mountains, not the foothills as those through which we had come—rose up very high, and over them came the light of the moon on to bones—elephant bones. But a hundred yards away from us a great bull elephant was sweeping up the rank, rich grass for his feeding, and beyond him we saw yet two more; so were they disposed that we two could not pass them to get into the valley, even had we been so minded, without being seen by them, or winded as soon as they get down-wind of us.

Beyond these three were bones, glistening white in the light of the moon. Bones and bones and bones, I tell you, and great tusks in the skulls of dead elephants—such tusks as the ivory-hunter dreams of finding, but does not find.

III.

I knew, but Joaquin did not know. I knew because my father had told me, long before, the story of how there is a place where the elephants come to die. For no hunter ever finds the bones of a dead elephant in the bush, but always, when they grow very old, the elephants set out for a certain valley in which to die, and over the entrance to the valley there is always a guard of live elephants, that no man nor other beast may come to this vast elephant graveyard.

I knew, I tell you, and so would have gone away unseen, but Joaquin, who did not know, had crept by the rock wall into the valley, and I knew that he aimed to get one of the guarding elephants between him and the low-hung moon, for a shot with his express-rifle. Seeing that if I called to him, it would but disturb the elephant herd, I could but follow him into the valley, to bid him come back. But I was not a score yards from the gateway before one of the guarding elephants threw up his trunk and trumpeted, and I knew they had heard or winded us.

In answer to that call there came a growing rumble of great hoofs; from somewhere far up the valley, where was thick bush, came the main herd of the guard, and the earth shook with the weight of their advance. Joaquin, who had thought to get a shot, made for a great baobab-tree which grew by the cliffside, and toward it I followed him, for already two of the guarding elephants had blocked the rock gateway into the valley. The third, that one which had trumpeted,

saw me first, and came at me, at which I too made for the tree, and leaped as Joaquin had already leaped. My rifle was slung, so that with it across my back it required a tremendous leap to clutch at the lowest branch even, and I saw that Joaquin's rifle lay on the ground at the foot of the tree. I leaped, I tell you, and swung up to another branch, and yet another, just as that great elephant snapped off the branch that I had first gripped as he charged by and turned to find me, and the might of the blow with which he struck the branch made the whole tree quiver like a sapling.

There was a ledge of cliff on which a man might stand, and a branch of the tree outthrust toward it. Joaquin went out along the branch and jumped to the ledge, and I followed him, leaping after him. In cold blood neither he nor I could have made that jump, but death was behind us, and so we took the risk.

We had scarce got foothold on that ledge before the hillside quivered as the herd charged up toward the tree. That elephant which had first caught wind of our approach to the valley charged the tree, and the impact of his skull against the trunk was such that, had we been still among the branches, we should have been flung out, to be trampled under the hoofs of the herd. We saw them plainly in the light of the moon, and they were all great tuskers, with no young among them. They were perhaps fifty, perhaps more, for they moved and circled round each other so that in such light it was hard to tell.

Beyond them shone the bones of their dead fellows, and mighty tusks, some black with age, some white and new-looking. They lay there, the skeletons of thousands of elephants who had come to the valley to die, and in seeing them I knew that the legend of the valley of bones was true, after all, and it was as the proverb has it, that there is never smoke without fire, nor story without cause. We had no longer any thought of hunting elephant, but only considered how we should prevent elephant from hunting us. You see, that is a little joke of mine. Oh yes, I can even joke in English, so well do I speak it.

The ledge that we had gained went up the side of the valley, but away from the entrance through which we two had come. Yet we had to follow it, for there was no other way, and a perilous journey we made of it. Once, since then, when I went on *safari* to the Mountains of the Moon, I have climbed real mountains, and in the climbing was no more of danger than we two found that night. We climbed and wound up and up, and the moon was high when we came to the top of the guarding cliff, and could look back on the valley.

For miles it stretched, and I could see no entrance but that one where still three elephants kept guard, trumpeting to each other from time to time, while the great main herd of the guard roamed by twos and threes among the bones in all parts of the valley, disturbed, and searching to see if any intruder were left in that sacred spot—for to them it is as sacred as are our burial-places to us. We saw them in that place of fear and mystery, patrolling among the bones of their dead; we caught the gleam of their mighty tusks, and saw the moonlight glint back from great rain-washed skulls of their dead; we gazed, before we turned away, on the place where the elephants come to die.

. . . . . .

No, I cannot tell you where is that valley, for I do not know your maps. If you would, and if I could, I might take you there, if I had a mind, for showing a way is different from telling that way to another. Yet in my mind I question if I would take you there. So far as I know, no living man—for Joaquin Hurtado is dead—has set eyes on the valley of bones save myself, and I count that the elephants have a right to one place that shall be sacred to them, even as we men have many places that are sacred to us.

Sometimes in my dream I see them, the shining bones, and the great tusks of the dead, and the herd patrolling in that guarded valley. I dream that I leap and clutch at the baobab-bough, and behind me thunder the feet of the charging elephant who guards the dead. Sometimes in my dream I stand on the top of the cliff and look down into the great guarded valley, the place where the elephants come to die.

I speak very good English, do you not think?

VENUS VICTRIX.

GODDESS! we trembling mortals bow before thee,
As votive wreaths we to thy temple bring;
Queen of the circling globe! we now adore thee,
And 'Venus Victrix' we exultant sing.

Great is strong Mars, and valiant in the fight;
Great is the fearless, peerless conqueror Jove!
Great is Minerva, throned in placid light—
Greater than *all* is loyal, royal Love.

For lowliness is Love's resplendent mail,
And gentleness her sceptre, white and pure;
All weapons that she beareth must prevail
O'er human lives, while sun and moon endure.

Then wake and worship, all ye gods of stone!
For Love is living, and her heart is warm;
Supremacy is hers, and hers alone;
She sways the whole wide world with her white arm.

She melts the iciest waters with her eyes;
She brings a crown and kingdom with her kiss;
She only—the immortal—never dies,
So, 'Venus Victrix,' this to know is bliss.

Chambers's Journal
SEVENTH SERIES

TOBIAS SMOLLETT.

By E. Beresford Chancellor.

I.

CENTENARIES are curious things. Sometimes the celebration of them seems almost superfluous, so deeply rooted in the public mind and the public affection is the subject of them. Shakespeare and Dickens and Burns, for instance, have, as it were, outsoared the necessity for such reminders, and the anniversaries of their births or deaths are hailed rather as occasions for festival than as a means of keeping people's minds alive to the fact of their greatness. On the other hand, there are centenaries which require recognition in order that a man's fame may not sink gradually into the oblivion which attends such as are remembered only by 'a little clan.'

I am not sure if Smollett is not to be remembered among the latter class. Those, of course, who give themselves to the study of literature know all about him and his works; but I doubt if outside this class many people read Smollett to-day. His fame has suffered a rather curious eclipse, and for a dozen who know *Tom Jones* or *Tristram Shandy*, I think it would be found that there was but one who was familiar with *Roderick Random* or *Peregrine Pickle*, or who had read the far finer *Humphry Clinker*.

Smollett is, indeed, one of those names which people glibly repeat, but concerning which their knowledge is vague. And yet in his day Smollett was not only a great novelist, and recognised as such; he was the typical man of letters of the eighteenth century—a pamphleteer, a reviewer, a translator, and a historian. He produced three great novels, some plays, and a little verse; while his book of travels in France and Italy overflows with interesting facts, and is informed with a curiously original power of observation and criticism.

The month of March marks the bi-centenary of Smollett's birth, and the occasion calls all the more for recognition because, as I have said, the writer's fame is a little in shadow. For Smollett, in whatever way one regards him, was a very remarkable man, one who made a figure in almost all the directions in which a literary worker can do so. Even in that century teeming with illustrious writers, the century of Johnson and Fielding, Sterne and Richardson, and a hundred others, he stands forth in a pre-eminent position, and can, in the eyes of some great judges, challenge supremacy with those whose fame burns with a brighter lustre. In a full, although a relatively short, life he succeeded in doing an extraordinary amount of varied literary work, and it is perhaps for this very reason—the full flow of his genius being diverted into so many different channels—that his name is less remembered than are those of the men of his time who controlled their output within narrower limits.

II.

Tobias Smollett was born in March 1721, and was christened on the 19th of the month. Little is known of his early years, but he appears to have received a good education at Dumbarton school, under John Love, who made a name for himself as a grammarian, and who had become head-master after being an usher in this establishment. Young Smollett's idea was to join the army; but difficulties occurred, one of which was the refusal of his grandfather to apply for a commission, he having already done so in the case of one of the future novelist's elder brothers. It was, therefore, decided that Tobias should follow a learned profession, and to this end he was sent, in 1736, to Glasgow University. He appears to have been the typical medical student of the period, full-blooded, boisterous, and a bit out of hand. In due course he was apprenticed to a Dr Gordon, and there is every reason to suppose that he qualified himself adequately for his new career. Even at this time, however, the desire of expressing himself by his pen became urgent, and we find him busy at a tragedy, *The Regicide*, a subject dealing with the murder of James I. of Scotland. It was, if nothing else, a symptom of unrest, and one is not surprised to find its author shortly afterwards throwing up his position with Gordon, and setting out to try a larger fortune in London. He arrived there in 1739, many of his experiences on the journey undoubtedly affording him material of which he made such excellent use in *Roderick Random*. Apparently one of Smollett's first acts on arriving in England was to attempt to secure the patronage of Lord Lyttelton; but failing in this, and perhaps anticipating Scott's dictum as to literature as a means

 [*All Rights Reserved.*]

of supporting life, he incontinently obtained the post of surgeon on a ship about to sail for the East. At a later date he made use of his varied experiences in this capacity, both warlike and peaceful, as 'copy' in his first two novels, and thus *Roderick Random* and *Peregrine Pickle* alike contain the germs of his autobiography, and are filled with the recital of many of their author's own adventures. Among other places he visited, in his capacity of ship's-surgeon, was Jamaica; and here he fell in love with a wealthy creole's daughter, whom he subsequently married in 1747. It seems probable that his wife's fortune was not so large as he expected. The anticipation of it, however, was sufficient to justify him in removing his name from the navy, to try his luck as a doctor in London. Thus we find him in 1744 domiciled as a physician in Downing Street, Westminster, not then, as now, wholly given over to the service of the State. Smollett while waiting for patients occupied his time in various ways. On arriving in London he found a number of his countrymen who were delighted to add him to the fellowship of their society, and he became a leading spirit at their gatherings; while a poem, the best of his little-known excursions into verse—*The Tears of Scotland*—some satires, among them *Advice* and *Reproof*, and a parody on Lyttelton's 'Monody' show that his pen was not so idle as his lancet. For the fact is that he made little headway with his medical skill, and after moving from Downing Street to Mayfair (hoping for better fortune in a more fashionable neighbourhood) without any marked improvement in his fortunes, he gave less attention to doctoring, and turned to literature as his chief business in life.

III.

As I have said, he married in 1747, and in the following year *Roderick Random* appeared anonymously. It made an immediate hit. The critics attributed it to Fielding, although reflection should have shown the differences between its author's methods and those of the author of *Joseph Andrews*. Its chief characteristic was the development of the eccentric, and a broad, full-blooded, somewhat boisterous manner of recounting adventures, combined with a certain cynicism of presentment which makes the book one rather for the student of its period than for the modern novel-reader. But it has the qualities of its defects, and remains a remarkable—as a first effort a very remarkable—production. It was avowedly modelled upon Le Sage, the translation of whose *Gil Blas*, issued by Smollett in 1749, is still regarded as a standard work.

The authorship was soon a matter of common knowledge, and Smollett became a person of importance in the literary circle in which he had already made a mark. Even with this success to his credit, he seems to have clung to his medical work; and although he did not make much headway in this direction, he took his M.D. in 1750, and apparently anticipated combining a literary and a medical career. Among other labours about this time was the share he took in assisting his friend Smellie with one of his medical treatises.

But he was on the eve of a far more momentous labour. During part of the year 1750 he paid a visit to Paris, and certain experiences there were worked up into his next important book, *Peregrine Pickle*, which appeared in the following year, and fully confirmed the reputation he had gained by *Roderick Random*. It is an advance on the earlier work, but it is disfigured by certain quite uncalled-for, in some instances gross, attacks on contemporaries, who found themselves pilloried under very thin allusions—Lyttelton, Garrick, Cibber, and Fielding all coming under the bludgeoning of the rather boisterous, and not very squeamish, author. It is difficult to understand the reason for Smollett's hostility to Fielding. If, as has been conjectured, professional jealousy was the cause of his attacks, all that can be said is that they were as uncalled-for as they appear pointless. After the first edition, which contained them, they were removed; and it is only fair to Smollett to assume that his better judgment caused him, on reflection, to realise his mistake. *Peregrine Pickle* was further vitiated by the inclusion in its pages of 'The Memoirs of a Woman of Quality,' written by the notorious Lady Vane, and said to have been interpolated for a money payment made by that person. These blemishes set aside, the book is a great performance, containing much fine characterisation and many brilliant descriptive passages. It is not Smollett's greatest work, but it properly takes its place as one of the most characteristic and outstanding novels of a period which was curiously rich in them.

IV.

Our author's next move was to go to Bath in order to try to establish himself there as a doctor. If the experiment was not a success in this direction, as it certainly was not, it had an influence on his eventual output, and many of the most humorous and amusing touches in *Humphry Clinker*, his last and by far his greatest novel, may be traced to its writer's sojourn in the city of Bladud and Nash. Smollett was nothing if not outspoken and combative, and the fact that he had not been long established in Bath before he wrote a pamphlet decrying the efficacy of its famous waters was in itself sufficient to create antagonism and to hurt local susceptibilities.

When, finally, he quitted the place, he did so with the determination of giving himself up entirely to a literary career; and henceforth doctoring knew him no more. Arrived in London, he immediately took Monmouth House, Chelsea, a large and imposing structure (it was

pulled down in 1835), and there established himself as a literary man pure and simple, frequenting the neighbouring taverns, such as 'The Swan' and 'Don Saltero's,' and soon surrounding himself with a distinguished company of writers, which included such men as Johnson, Goldsmith, Sterne, Garrick, Wilkes, and Hunter; while the host's natural goodness of heart was exhibited in the hospitality he extended to numbers of less successful workers in the same field. Indeed, he became something of a patron, although he must have strained his resources to do so, and could only have succeeded as he did by constant and unremitting literary labour. His wife's income, nominally more than adequate, suffered diminution, and as he seems to have anticipated much of it, his monetary troubles were a constant source of vexation and anxiety.

But he was not the man to be daunted, and the writing of *Ferdinand, Count Fathom*, was succeeded by that translation of *Don Quixote* which, although, as its adverse critics said, it was really but a *rifacimento* of Jervas's work, yet proved a marked success, and long held the field as the standard version.

The year after it appeared Smollett became the head and front of the *Critical Review*, which was inaugurated by Archibald Hamilton in 1756. There is no doubt that this venture was one of the ablest that had hitherto appeared. Its criticisms on well-known works were written with knowledge and ability, and it may, in a way, be regarded as the parent of that remarkable series of similar publications which have adorned the annals of British literature ever since. Unfortunately Smollett could not keep clear of the personal note, and some of the strictures contained in the *Critical* brought him into conflict with dangerous adversaries such as Churchill, and created a feeling of antagonism in men like Grainger, whose influence was extensive and whose friends were many. While he was carrying on this *Review*, and incidentally indulging in all sorts of reprisals against his critics, Smollett was engaged on his *History of England*, a venture in which he designed to forestall the completion of Hume's work, certain volumes of which had already been issued. Smollett had become a journeyman of literature, but, notwithstanding the multiplicity of his undertakings, he managed to impart to all sorts of what might have been supposed to be alien labours the touch of an able and practised hand. His *Compendium of Voyages* was followed by a farce, *The Reprisal* (about which he may be allowed to have known something). These, again, were succeeded by that *Universal History* in which he collaborated with Dr John Campbell. Then suddenly he was mulcted in a fine and thrown into the King's Bench on account of a libel on Admiral Knowles. The incident was far from stopping his labours, however, and we find him carrying on his literary work, visited by his friends, and living the three months of his imprisonment not unhappily, just as Leigh Hunt did some sixty years later.

v.

The year of George III.'s accession saw Smollett embarked on a fresh venture—the starting of the *British Magazine*, in which first appeared a new, but hardly successful, work of fiction, *Sir Launcelot Greaves*, in which the Cervantes vein is worked in an alien manner and an alien period; while that dangerous love of caricaturing his contemporaries in which the author habitually indulged is here again resorted to with renewed energy. Following a visit to Scotland, where he was the guest of George Home, Smollett issued, at the close of 1761, the first volume of the Continuation of his History, which was followed at intervals by other instalments, and now forms a recognised sequel to the work of Hume, which the complete book was at first designed to supersede. During the next year the author undertook the editorship of a journal called *The Briton*, started with the intention of defending Bute against the assaults of his numerous enemies. There is no doubt that it did its work as thoroughly as was possible, and Smollett's later grievance against the Government for its non-recognition of his labours appears well grounded. The starting of *The Briton* soon brought into the field an opponent, in the person of Wilkes, whose *North Briton*, laying about it right and left at everything Scottish, so irritated Smollett that after a few months he relinquished his conduct of *The Briton*.

It was perhaps as well that he did this, for the amount of other literary work he had undertaken was so large and so various that one man, even helped as Smollett was by paid assistants, could hardly hope to do justice to his multiform activities. These included not only the superintendence of the translation of Voltaire's works, with historical and critical notes, but all sorts of compilations and hack-work, which must have made his house a sort of literary factory in which the novelist was like a working foreman, incessantly labouring at top-speed, with too few of those happy intervals in which he could enjoy the society of his wife or play delightedly with his idolised little daughter.

It was the premature death, in 1763, of this only child that gave a staggering blow to Smollett's already anything but robust health. After it he was never the same man. His grief was intense; and when he went abroad, later in the year, he went in the hope of forgetting amid foreign scenes a sorrow that proved unforgettable. There is little doubt that the jaundiced view of men and things which characterised 'Smelfungus,' as Sterne dubbed him in the *Sentimental Journey*, and which is apparent throughout the otherwise excellent book of travels which Smollett published on his return from his wanderings in France and Italy in 1765, was the result of that

shaft which embittered his later life. At the same time, his journey did him good, and the visit he paid to Edinburgh in the following year, when he mixed with the brilliant set that gave to the capital its name of the Northern Athens, temporarily, at any rate, completed the cure. But it was but temporarily, and before long he was induced by his doctors again to try Bath, although one remembers that so far as its waters were concerned he had earlier admitted himself a sceptic.

It was there that he began his last, and his greatest, novel—*Humphry Clinker*. On his return to London he appears to have worked on this excellent and amusing book, and, in addition, he published *The Adventures of an Atom*. They were the last flickers of a tired man, and, considering the circumstances, the uniform excellence of *Humphry Clinker*, its humour, its variety of telling characterisation, and its 'go' are the more amazing. But the novelist's health gradually grew worse, and another journey to Italy was recommended, rather obviously in the nature of a last resource. He left England in 1769, going first to Lucca and Pisa, and in the following year reaching Leghorn. It was in Italy that the last touches were put to *Humphry Clinker*, a book which has been uniformly praised, and which remains its author's masterpiece and his swan-song. For on 17th September 1771, with the words, 'All is well, my dear,' addressed to his wife, his ardent spirit ceased its life of turmoil and activity.

Smollett lies in the English Cemetery at Leghorn, just as Fielding does in Lisbon, and Keats in Rome. In Scotland a tall column, between the Clyde and Loch Lomond, perpetuates his fame. But, although he may not be read as Fielding and Richardson and Sterne are read to-day, he requires no such memorial. The man who has given us such portraits as those of Commodore Trunnion, Strap, and Matthew and Tabitha Bramble, to mention no others; the man who during his lifetime received the suffrages of such as Johnson and Burke and Lady Mary Wortley Montagu, and who has been praised by Scott and Hazlitt (they both thought him equal to Fielding), Leigh Hunt and Thackeray, requires nothing further in the way of recognition or commemoration, and is safe from censure or depreciation.

So much for the writer. As to the man, we may regard him as the typical Briton of his period. Generous to his friends, loving and tender to his family, he hid under a rough exterior sterling qualities. He was proud, independent, what the French call *difficile;* in his travels he exhibited, as is so often the case with us islanders, the worst traits of his character; although in those days many excuses can be found for him in the dishonesty, the 'grasping' character, the suspicion of small hotel-keepers and post-boys, which were a by-word. When all is said, he remains a great writer and an upright, hard-working man, whose name will endure as that of one of the outstanding novelists not only of his period, but throughout the range of our literature.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER IV.—*continued.*

V.

CLEMENT SEADON was for the moment dazed by the dismaying unexpectedness of the news.

He had lost. Mr Neuburg and his gang had not wasted a moment. Short though his captivity had been, it had been enough. They had whipped the girl out of his reach. They had effectually put a barrier of distance between him and Heloise. She had gone away with them, in their power, without his being able to speak with her, to warn her, to save her from the great danger he felt certain threatened her. They had acted promptly, those scoundrels. He had lost, and they had won.

He had a bitter vision of Heloise travelling away from him—away through this vast country where communications were scarce. She was more completely in the clutches of those terrible and sinister people with every mile she travelled, and he was less able to help. He stared at the porter. 'She's gone,' he said. 'She—didn't the lady leave a message?'

'None, sir. She seemed to expect that you was going to see her.'

'Yes,' said Seadon. He could understand how bewildered Heloise must have been when he did not keep his appointment that morning. 'And you're sure she went to Montreal?'

'Yessir,' said the porter.

Some one touched Clement's arm; somebody said, 'Seadon, old fellow.' Clement waved this hand aside without looking round. 'Just one minute,' he said. Then to the porter, 'You're sure it was Montreal? I mean, she wasn't going farther? Through to Sicamous, for example?'

'Sure they're stopping off at Montreal, her and her lady fren'. Didn't I check their baggage to Montreal?'

Clement thought for a moment. What did that mean? Did it mean that Heloise would stop in Montreal, or did it mean that she was merely changing trains there in order to go to the place—wherever it was—where Henry Gunning was lurking at the moment? That seemed the more likely, and it was the more dismaying. She was

going to some unknown town in the tremendous continent; a town of which he did not know, and of which he'd find, perhaps, the scantiest clues —if any clues. It was a dismaying problem. It filled him with dread even to think of it.

His arm was touched again. He thanked the porter, turned, and saw the captain of the *Empress of Prague* by his side. 'Hallo, Heavy!' he said.

'I've been looking for you, old chap,' said the captain. 'I want you to meet The Chief.'

'The Chief?' echoed Clement vaguely. He saw a man of middle height with astonishingly thick, square shoulders standing by the captain's side. He was a man with a firm, sunburnt face in which big bones showed strongly. His nose was powerful and high-bridged, and the skin round the eyes was dark. The eyes were extraordinarily steady and keen, and, since he was smiling, his face had a singularly pleasant, indeed tender, kindness which tempered its undoubted resolution. Clement looked at this man, and knew him at once for a staunch and extremely capable friend. He said again, 'The Chief?'

'He's our policeman,' said the genial captain. 'He's down here to find out why you weren't arrested in that diamond tiara affair on the *Empress*.'

'Is he, by Jove?' cried Clement abruptly, glancing at the strong, intelligent face of The Chief with a sudden feeling of hope.

'He's the head of the railway police organisation,' explained Captain Heavy. 'Not the Dominion police, mind you. His name, by the way, is Joseph Fiscal. And, seriously, he'd like a few words with you regarding that robbery.'

'He's the very man I'm wanting myself,' said Clement heartily, to the surprise of the captain. Nothing yet created seemed able to surprise The Chief. 'Can we go somewhere and talk?'

VI.

The three men went into the private sitting-room in the manager's office. The first thing Clement did was to take his left hand from the pocket in which it had reposed since he escaped from the house in the Sault Algonquin, pull up his sleeve, shake his arm, and so expose to The Chief the handcuff still clasping his left wrist.

That redoubtable man looked at it calmly, fingered it, sat upright slowly, and turned on Captain Heavy a dry, genial smile. His eyes scrutinised the puzzled face of the captain for but a moment; then he turned back to Clement. With the same movement his hand came out of his pocket, and in the hand was a handcuff-key.

In a few seconds, and with free hands, Clement was rolling down his socks, exposing the handcuffs on his ankles.

The smile of The Chief became broader. 'Is your friend quite as honest as you think, Heavy?' he asked genially.

'Ab-solutely,' said Heavy in a perplexed tone. 'Though he does seem to have been trying to do Houdini stunts, and failing.'

'Not altogether failing,' smiled Clement, as The Chief's key got to work. 'I managed to get out of *this* trap, just as I managed to get out of the one on the *Empress*—the diamond tiara trap.'

'Ah,' said The Chief, looking up, smiling with his lips, but his eyes keen. 'There *is* something behind it all?'

'There is; but, first, how soon can I get to Montreal?'

'Talking to us won't hold you up,' said The Chief with unexpected penetration. 'You can't go before the night train.'

'Isn't there anything before that — any means?'

'No,' said The Chief. He looked at Clement steadily.

'Well, as I said, I want your help; but it's going to be a tale, even a sort of "shocker," a strange, unbelievable crime and mystery story.'

'I'll be able to appreciate it,' smiled The Chief. 'Go on, Mr Seadon.'

So Seadon told the whole story from the beginning. He told it from the first surprising and headlong interview with the little lawyer, Hartley Hard. He told how the lawyer had entreated him to look after Heloise. He made it plain that the lawyer's fears that Heloise's quixotic journey to her girlhood's lover was all part of a devilish trap to get control of her and her million of money had been more than confirmed by the actions of Mr Neuburg, the companion Méduse Smythe, and others of the gang. He told of the way the gang had endeavoured to cut him off from Heloise, to raise a barrier of misunderstanding by means of the stolen letter; how the rogues had even tried to get rid of him by means of such tricks as the stolen tiara and this last attempt to trap him in the house of Sault Algonquin. He told how he had escaped—and yet how he had been too late to speak to Heloise, to save her, as, of course, he could with the information he possessed about Gunning and the evil deeds of the rogues. He told everything, indeed, except one thing. That thing was the little lawyer's suggestion that he should make love to and marry Heloise, and the fact that he had himself arrived at the conclusion that the little lawyer had talked wisdom. He did not speak of it, but perhaps the men who listened were not unaware of his condition. The Chief smiled even more humanly. Heavy, with a seaman's bluntness, cried, 'I remember Miss Reys—a beautiful woman. To think that a pack of scoundrels—— Still, old man, you've got The Chief with you now.'

Clement thought of Canada and its vastness. Even the most astute chief of police would find it difficult to track a girl through that immensity —and do it in time. Yes, it would have to be in time; Clement understood that painfully.

'Mr Seadon is not quite sure about The Chief,' smiled the head of the railway-police.

'Well, Canada 's such a huge place. It 's easy to vanish without trace in such a country.'

'Oh, our system compares with the country,' said The Chief genially. 'That porter told you he 'd checked Miss Rey's baggage through to Montreal? We 'll begin by confirming that.' He pressed a bell. A girl came in. 'How do, Miss Jeannette? I wonder whether you 'd mind asking Mr Labage—he 's still at the rail reservation desk, isn't he?—to step along. Say, that 's real nice of you.'

Mr Labage came in. The Chief said to him immediately, 'How are you keeping, Mr Labage? That 's good. Now, I 'm wondering if you can tell me if a lady from this hotel and her companion, a Miss Heloise Reys and a Miss Méduse Smythe, took reservations on any train pulling out to-day.'

'Sure she did. Both ladies reserved on the Imperial, leaving at 1.15. They reserved for Montreal.'

'That confirms it, then,' said Clement.

The Chief only smiled; he was after full proof. 'And, say, did another feller—a big feller by name of Neuburg—go out to-day?'

'He certainly did,' said the efficient Mr Labage. 'He an' a feller with him, some one outside, had reservations on the morning train.'

'To Montreal?'

'To Montreal.'

'And the next move, Chief?' asked Clement, as the railway-clerk went out to his desk in the hotel lobby, for he knew that there would be another move. He saw that The Chief had made it certain that Heloise—and the gang—were going straight through to Montreal, and were not leaving the train before. He was beginning to appreciate the calm ability and keenness—yes, and the immense resources—lying behind the genial smile of this man.

The Chief put out his hand to the telephone. 'I want Montreal, miss,' he said into the receiver. 'Get me Windsor Station, the Department of Investigation.' He hung up and turned to Clement. 'This feller Neuburg is new to me. I 've been thinking about him, but I can't place him. He must have come up from the States, or he must have worked behind others. The one class of life I am thoroughly acquainted with is bad men. I know all the leading lights, but I don't get him. . . . This Gunning feller we 'll get news of—easy. And we 'll find out about this Joe Wandersun. He 's Neuburg's travelling-companion on this trip, since Siwash stayed, hey? P'r'aps we 'll trail up Siwash Mike too. But this Neuburg. . . . Give me an idea of him, Mr Seadon.'

Clement described Neuburg as pointedly as he could, while The Chief listened with his smile, as though it were merely a good story, but his level and capable eyes proved his keenness.

Clement had just finished his picture of the master-rogue when the telephone-bell rang. The Chief picked up the receiver. 'That Mac speaking? This is The Chief. Who 's about? . . . Ah, Gatineau 's there. Call him. . . . Oh, Xavier, it 's The Chief speaking. I 'm in Quebec on the *Empress* robbery case. . . . See here, there is a lady stopping off at Montreal on Imperial No. 1. She is a Miss Heloise Reys; she has a companion with her, a Miss Méduse Smythe. I want her trailed. Find out where she 's stopping if she stays in Montreal. If she isn't staying, find out where she 's going and by what train she goes. . . . No, don't interfere with her; just find out what she 's doing. Got that? Next, I want you to find out all you can about a feller called Henry Gunning, and another called Joe Wandersun, both of Sicamous.' He gave the few details Clement had been able to give of these men. 'If you can't find out anything about 'em in Records, or from the Dominion police, just flash through to Sicamous or Revelstoke. Got that? Next isn't so easy. I want to hear something about a man who calls himself Adolf Neuburg.' He spelt it out. Then he described him with an accuracy which was amazing, considering he had only had Clement's not very expert description. 'This feller Neuburg seems to be an out-size bad-hat, but I can't place him. We haven't come across him, I know. But just find out if there 's anything known. You might trace him through mining, or you might pick up something about him in connection with British Columbia. He pulled out of here for Montreal on the morning train—see if that helps. . . . You 've got all that? Well, if it 's possible, long-distance me here at the "Frontenac" about Miss Heloise Reys. The other stuff can keep. I 'm pulling out myself by the night train.'

As The Chief put down the instrument Clement said enthusiastically, 'That 's splendid; it draws a noose round them. We 're bound to have them now.'

'Yes, there are possibilities in my job,' smiled The Chief. 'We 've got many means of heading off rogues and finding out things about them.'

'And I 'm going to give you another,' said Clement. 'This Sherlock Holmes business is contagious. This is my offering to this conspiracy of detection. Miss Heloise went because she had reason to go. Yes, I know they must have persuaded her, and persuaded her well, for why else has she gone in such a hurry? That 's not like her. . . . And, then, she expected to have a talk with me.' He tried not to show youthful emotion. 'But—and this is my point—they wouldn't have persuaded her unless they had something to persuade with. At the bottom of this journey there must have been a message.'

The Chief stood up, reached for his soft hat. 'That 's it. She got the message she was expecting about this Gunning man. He 'd been found, as we know; the message told *her* he had been

found—and where. You said she had letters addressed to her at the Post-Office. Come along; we'll look at that message.'

They went down the hill to the Post-Office, where most of the notices were in French. The Chief's authority took them at once to a superintendent, who had no difficulty in finding the duplicate of a wire which Heloise Reys must have received late the night before. The wire had come from Sicamous. It was signed by Wandersun—that meant Joe's wife had sent it. It said tersely: 'Gunning found now working at Cobalt.'

'Cobalt!' said Clement, staring down at the flimsy slip. 'That's the famous silver-mining town, isn't it?'

'Yes, and this Gunning is a miner,' said The Chief. 'Well, that's all natural enough. You see what's happened. When Gunning broke loose from those toughs he came east, meaning probably to hit the high spots. Somewhere this side of Winnipeg his money ran dry, just about the time he was sobering up. Being on his uppers, and being a miner, he'd just naturally think of Cobalt, for Cobalt'd be the place where he would find his own job, and at good money. So he went to Cobalt.'

'And I see how they persuaded Heloise—Miss Reys. They made her feel that if she did not start for Cobalt at once, there'd be every chance of her missing him again. Gunning would wander off again directly he got money into his pocket.'

'Yes; and they got her to go by that train because she'd be able to catch a connection out of Montreal,' capped The Chief. 'She'll go out by No. 17. It's one of the few direct trains. She'll get a through-sleeper on that. Cobalt it is, Mr Seadon.'

'But Cobalt is an unhandy place to get at.'

'It's just as unhandy a place to get out of, too. But it's Cobalt she's gone to; take that as fixed, Mr Seadon.'

Before they boarded the night train for Montreal they knew definitely that Cobalt was Heloise's destination. Over the long-distance 'phone from Montreal they had learnt that the girl and her companion had taken reservations for Cobalt on the night train.

That, and one other fact, was all the fresh information they obtained. The other fact was that a large man, answering unmistakably to the description of Mr Neuburg, with a companion, had left Montreal earlier in the day.

He, too, had booked through to Cobalt.

VII.

Thanks to The Chief, Clement was able to travel to Montreal in a drawing-room compartment; that is, he shared the privacy of The Chief, and did not have to sleep in the public sleeping-car. In spite of this advantage, however, he had a bad night.

All night he was thinking of Heloise and the danger she was in. His own adventures with Mr Neuburg and his gang had taught him that there was very little these scoundrels would stop at, and the thought of that slim, beautiful, and fine-tempered girl at the mercy of creatures so base and so cruel was a thing of terror.

What would happen to her? What, even now, was happening to her, or was about to happen?

She was on her way to Cobalt, where the man who was invested with all the romantic glamour of her girlhood's love was working. Mr Neuburg had travelled to Cobalt before her; it was easy to know why. He was going to see Gunning first. He was going to see to it that Gunning was up to the scratch when he met Heloise. If Gunning was still suffering from the effects of drink, then Gunning would be sobered. Mr Neuburg, with his terrible, silent power, would see to that. If Gunning was down at heel, unseemly, then Mr Neuburg would see to it that Gunning was presentable. Mr Neuburg had gone on ahead so that the whole business should be stage-managed efficiently. Mr Neuburg was going to take no chances.

Heloise would arrive at Cobalt. She would find Gunning. Her introduction to him would be a calculated affair. Every ounce of romance would be brought to bear upon her responsive nature. She would find him, perhaps working, perhaps alone in a rough house; living alone, remote, fighting against odds. Oh, the whole business would be beautifully done. And Gunning would be well coached. . . . And she would be filled with a splendid pity at his braveness and his plight. That meeting would be made poignant, ineffaceable. It would have such an effect on her genuine and lovable nature that all the things he, Clement, had to tell her, all the truths he might utter concerning the plottings of these scoundrels, would be negatived by her feelings for her lost lover. . . . Gunning would only have to be plausible to carry weight with a girl willing to be persuaded. And with Mr Neuburg at his back Gunning would be plausible enough.

At Montreal they were met by a slim, pleasant young man, with a quiet manner and a nearly bald head; a satisfying young man, whose quiet modesty covered a definite ability to think and do things quickly. He told The Chief at once that he had reserved accommodation for two on the next train out to Cobalt.

'Two?' asked Clement.

'Xavier Gatineau here is going with you, Mr Seadon,' said The Chief, indicating the quiet young man with a nod. 'It's our case, too, you know. We want to get to the bottom of that tiara business. Now, come along and have breakfast with me. We have time before your train goes. Xavier will tell us anything fresh.'

Over the cantaloup and ice-water and Gaspé salmon and superb coffee, that made the ordinary breakfast, the young man told them there was nothing particularly fresh.

'The two ladies went through to Cobalt,' he said. 'A point is, they travelled light. They took only suit-cases. The heavy baggage was left here—on demand. The baggage-master told me that Miss Reys expected to wire for it to be sent on somewhere.'

'That means they don't expect to make a stay in Cobalt. It also means that if they left in a hurry it wouldn't be so easy to trail them,' commented The Chief. 'Well, we're warned, anyhow. I'll take steps, Xavier. If you lose the trail, or anything goes wrong, get a message to me. I'll try and have something at all sections,* too, and I'll send a general warning west. Now, about Mr Neuburg?'

'He pulled out early on the west-bound. He'll have changed at North Bay, and so got to Cobalt last night. I haven't been able to connect up with Cobalt.—It's not on our system, you know,' he explained to Clement. 'Neuburg had another man with him. Both carried only suit-cases.'

'Anything through from Sicamous?'

'Joe Wandersun is a bad-hat. We have his record, because he fell foul of us once over false declarations in way-sheets. He's got a shack at Sicamous. . . . I've had a message through from the station-master there. Seems to be living more or less in retirement for the present. Sicamous, anyhow, is no more than a scattered handful of shacks, no scope for a man who lives by his wits. That's what Wandersun has been doing for years. He's done a term in prison for fraud; it reads as though it were the confidence trick. He's a friend of Gunning's.'

'Ah,' said Clement, 'you've heard something about Gunning.'

'Our chap at Sicamous says he's a remittance-man. That's a term in British Columbia for a man who won't work—a fellow who lives by sponging. He's a ne'er-do-well, apparently. Says he has mine-claims, and is a boose artist.' The young man's eyes twinkled. 'That's our expression for a man given to drink, Mr Seadon.'

'Nothing against him?'

'Nothing proven—to our knowledge; but his habits are bad, and his company shady.'

'Have you found out anything about Siwash Mike?' asked The Chief.

'Nothing.'

'Neuburg?'

'I'm going to hear from the Dominion police—perhaps; or, rather, they'll get on to you, sir. They don't place him. But one of them said he had an idea that the description you gave was like a man the U.S.A. police were after. So far as he remembered, this man was wanted in Oregon—well, considerably more than a year ago. They are going to look into it, and get in touch with the U.S.A. too. They'll communicate with you, sir.'

* A section on the C.P.R. is 133 miles. All trains stop at the end of each section to change engines.

From the way he spoke, Clement thought that the quiet young man was holding something back. Abruptly he leant across the breakfast-table. 'Did they say what he was wanted for?'

The young man looked at The Chief before answering. The Chief nodded.

'Murder,' said Gatineau quietly.

Murder! Clement fell back in his chair staring at the quiet, partly bald young man who had made the calm statement. Murder! Heloise was in the clutches of a man wanted for murder.

'So far as the Dominion police could remember—it was a good while back, you understand—it was a matter of murder, or complicity in a murder. Something with a lot of money in it, and a man killed. But they'll find out the full facts.'

'Good God! and that girl is in this—this murderer's power!' gasped Clement, unable to think of anything else.

'It may not be the same feller, Mr Seadon,' said The Chief kindly. 'It's an old case, and they are only working from memory, not facts.'

'Are there many men answering to the description of Mr Neuburg?'

'No,' said The Chief slowly. 'But, then, I don't know. An' when we get the Oregon description, we may find it doesn't fit him.'

'A case of money and murder—that fits Neuburg,' said Clement. 'Yes, he's a murderer and a thief, and—and that poor girl's at his mercy. We must do something.'

'We can't do anything until you get to Cobalt, Mr Seadon. Come now, you mustn't lose your nerve.'

But the thought of the terrible danger Heloise was in was too much for Clement. He was torn with anxiety. It was awful to think that Heloise was out there—out there in the great spaces of Canada—without anybody to defend her, completely at the mercy of that huge and implacable man who would stop at nothing, who had, it seemed certain, not stopped at the most terrible of all crimes on a previous occasion in order to further his own ends. Like a man battering his head against a stone wall to find some way through, his mind darted hither and thither trying to find some means of aiding her, even though he was that vast distance separated from her. He said, suddenly, 'Can't you get through to Cobalt—warn her by 'phone or wire?'

'By the time we connected up with the police the business might be over,' said The Chief. 'Worse; it might precipitate matters. Best wait until you get to Cobalt yourself, Mr Seadon.'

Clement thought he was right. Anxious though he was, he felt that for the moment the only real danger (and he thought that grave enough in its way) was her meeting with Henry Gunning. Neuburg and the gang would do nothing until they saw how that turned out.

Indeed, they would avoid all violence, for that would clash with their plan of making the meeting a lovers' reunion. . . . No, there was no danger of physical hurt—yet. But there might be if the rogues suddenly found their hands forced. A hint of suspicion shown by a clumsy police-officer, a hint that their whereabouts had been discovered and that Clement was hot on their trail, and they might do anything, might feel themselves forced to take any steps, in order to secure themselves. No, it was best not to disturb them until Clement himself was within striking distance, until he was there to protect her against—against that murderer.

'You 're right,' he said to The Chief. 'We can do nothing until I get to Cobalt. And when I get to Cobalt, then I 'll settle the matter once and for all, even if there are twenty murderers about her.'

(*Continued on page 261.*)

A NOVEL LIVE-STOCK INDUSTRY.

IN the little province of Prince Edward Island some thirty years ago there was established the then new industry of breeding silver and black foxes in captivity. The pioneers met with many difficulties and discouragements; but, after years of disappointment, they at length succeeded, and the business has now attained large proportions. Charles Dalton (now Sir Charles) and his partner, Robert Oulton, were the prime movers in the enterprise, and both in time made considerable fortunes as a reward for their patient skill.

The ordinary red fox had been common to all parts of Canada from the date of the first settlement, and no doubt for centuries previous, and amongst them the trappers came upon occasional specimens of both the black and the silver-gray varieties.

These were found to have a much higher fur value than the red variety. For this reason, and because the supply of merchantable furs from the forest was steadily decreasing as the settlement of the country advanced, it was thought to be well worth while to make a painstaking effort to domesticate the silver fox, and the result has fully justified this conclusion.

Some excellent specimens of both black and silver fox pups were unearthed, and the effort was made to rear them to maturity. But the cunning creatures, when a little more than half-grown, proved exceedingly resourceful in making good their escape. They would jump or climb over enclosing fences, or burrow beneath them. And at first they would not breed in captivity. This led to the evolution of the modern fox-ranch, an enclosure of meshed wire, attached to posts about ten feet high, and made with an overhang at the top, projecting inwards about two feet to prevent the foxes from climbing over. The meshed wire was also extended downward into the ground to a depth of two or three feet to prevent escape by burrowing.

At length a very few young were produced, but only a fraction of these grew to maturity. The parent foxes were very distrustful of their keepers, and made all possible efforts to conceal their young ones, sometimes burying them in the snow or in the ground, according to the weather conditions. In other cases the change from their wild, free life in the forest to close captivity in a wire enclosure seemed to destroy the maternal instinct, and the mother foxes would devour their young. The infant mortality among fox pups bred in captivity still continues to be serious.

Messrs Dalton & Oulton kept their enterprise secret until they had surmounted the initial difficulties and had begun to find a profit from their furs, sold in London. In the year 1910, out of a small consignment of silver-fox pelts sold for them at Lampson's, one skin realised £540, and another an even £500. After that secrecy could no longer be maintained, and the enterprising owners began to sell breeding foxes to their neighbours. And quickly the prices realised for these advanced from $2000 or $3000 per pair to $10,000 per pair. In 1912 the first fox-breeding companies were incorporated.

The 'boom' was now on; companies to breed foxes were incorporated by the score and the hundred, ranches were built in equal numbers, and the price of good quality breeders rose to $20,000, $25,000, and even $30,000 per pair, so greatly did the demand exceed the supply. Very high prices were continued down to 1914, and these were sustained by the huge profits made by the fox companies and by individual owners of well-stocked ranches. I well remember being present at the annual meeting of one of these companies, in which I had five or six $100 shares. It was with some trepidation that I saw a resident Presbyterian minister then and there invest $2500, probably the savings of a lifetime, in the shares of this company. I was present at the annual meeting the following year, and saw him receive the company's cheque for $25,000, along with additional shares equal to 50 per cent. of what he already held. Other fox companies paid dividends of 200 per cent. to 300 per cent.

This was the period during which money was rapidly made by promoters of fox companies and by those who had breeding foxes to sell. During this time no foxes were killed for their pelts. Then came the Great War, and with it the practical closure of all the European fur-markets.

This reacted upon the demand for living foxes, and resulted in a swift decline in prices. A large majority of the fox companies stopped paying dividends after 1914, but most of them continued in operation, and began adding the best in quality of their young foxes to the breeding stock of their ranches, also getting rid of their inferior or non-productive animals. In fact, the industry came down to a pelt basis almost entirely.

In the meantime, and during the closing years of the war, extensive fur-markets developed in New York, St Louis, and Chicago, and later in Montreal, at which silver fox proved to be in good demand at fair prices; and, while few new ranches were set up in Prince Edward Island, there was a growing sale of breeding foxes abroad, but at modest prices compared with those of the boom period. Sale prices for breeding foxes ranged from $500 to $2000 per pair, while the maximum price for pelts was $1200 to $1500 each. In 1919 a fraction of the fox companies resumed the payment of dividends, paying 3 per cent. to 12 per cent. Last year a much larger number came again into the dividend-paying class, and averaged a higher rate of payment.

The sale of breeding silver foxes has extended from Prince Edward Island to every one of the nine provinces of the Dominion, to a dozen of the border states of the American Republic, and to Norway, Japan, and other Eastern countries. It is claimed that the original black and silver foxes of this island possessed the most lustrous fur, its climate and soil alike being conducive to this result. There is no lime in the soil, and the fox being a burrowing animal, he here escapes the tarnishing effect of lime upon his fur. It is also claimed by fox men that the highest prices ever yet realised for silver fox were from animals bred in the ranches of this province.

Be these contentions well founded or not, there can be no question that the business of producing a very valuable quality of fox-fur under domestication originated and was developed here, and has attained a status not approached in any other state or province of the civilised world. As now carried on, it is conducted in about five hundred different ranches, containing approximately twelve thousand breeding foxes, with some ten thousand pups of the year's production. And those engaged in the business very confidently assert that their fur-farming business is the most profitable live-stock industry in the world to-day. This is a large claim; but it is to be remembered that the fox is cheaply fed and cared for, and comes to maturity in a year, being then worth as much as a young horse of three years, which has cost many times as much to feed and care for.

REGINA'S AFTERNOON.

PART III.

IX.

AND there she rested, and listened—and little by little recuperated—while Captain Chirk, none too coherently at the outset, gave tongue to his own astonishment and sensations.

His primal concerns were creditably unselfish, and it was only when he understood that Regina was neither dead of fright nor likely so to die, was not even unconscious, and preferred to stand thus in his arms rather than be set upon a chair, that he began to be fluent about himself.

It was the rottenest day, and one of the absurdest, that he had ever had to do with, although probably he deserved it.

He ought to have known that when Regina said a thing she meant it. Herein she differed so admirably, as a rule, from most other girls of his experience, whose minds had quite untrustworthy backbones. She had told him to go home for Christmas, since the privilege had been granted to him. He was not eager about it, as she knew; but the events of the day had shown that she was right. He *ought* to have gone home, and not hoped that Regina had not meant it when she said that a man's mother had, she supposed, the first claim on his bits of leave.

'I *did* think you might have stayed,' said Regina faintly at this point.

His embrace tightened. 'Darling! If only I'd *known!*' he exclaimed.

'Never mind,' soothed Regina, in the concentrated comfort of the moment. 'Somehow I *thought* you wouldn't. Go on.'

'But, I say, old girl'—— he demurred.

'Go on, Bobby,' said Regina.

'But'—he persisted, making a disturbing movement which still further revived her intelligence—'I'm no end glad you're bucking up, old thing, and it's as ripping as can be to have you like this. But—it makes me frizzle to think that I'm in that blighter's clothes. It's an insult to your dear face that you should *touch* me while I'm like this. By Jove! yes. And that reminds me—I ought to be getting on the fellow's track. I really ought, you know.'

Uttering a little cry, Regina released herself from his embrace. She also remembered something. 'I've *shot* you, Bobby!' she wailed, in new consternation. '*Don't* smile like that. I know I did, because—— Let me *look!*'

Captain Chirk turned his gaze sharply to the pistol upon the floor, then laughed and shrugged his field-gray shoulders.

'If it's only that baby thing, I don't care a—anything!' he said, with heartening levity.

Nevertheless, he helped her to look, and laughed on with a boisterousness that was more fine medicine for Regina when, between them, they discovered only two tiny holes in the field-gray trousering.

'I've a hide thick enough to stop fifty such, and no harm done, after the first twinge,' he declared stoutly.

'Are you *sure?*' asked Regina, so enchantingly wistful that he had to clasp her again. And, thus clasping her, he went on with his story.

'It's the rummiest yarn, and I positively must be off directly to cable about the county, and chance what they say about me. The beggar must have lain in wait by the cromlech and sandbagged me, or something of the sort. I was sitting down, making a cigarette, when—*thud!*—it came on my napper, and I didn't know a thing more till I found myself all in a huddle, among *these* filthy togs.' ('You poor boy!' interjected Regina.) 'Yes, exactly, old girl. That's what I felt like too until I began to get some light on the situation. That set me up, and I hadn't much more than a headache when I got here. Thought I'd just call and tell you about it, you know, on my way to the post-office. And that's where the mischief began again. It so happened that on Thursday I met an antiquarian old bird at the "Goat" of Dolgelly, and in talking about Gwynfrwyn he told me he believed the old secret passage started from this very room we're in—where I've busted the woodwork. Couldn't have had my senses in proper control and all that, you know, or I'd never have done such a hot-headed, silly thing; but the temptation buzzed at me when I found no one at home, not even the faithful Megan'——

'She's gone. She left this morning,' said Regina placidly.

Suddenly she remembered *everything*, and tore herself apart from him.

'*You* didn't hide in the hall, behind Old Sixteenth-Century, Bobby—*did* you?' she asked, with feverish eyes upon him.

'Hide? Not much. The idea!'

'No. Then there's some one else in the house.' A shudder shook her. 'It's too horrible, but there's blood. You know the oak chest in the state-room upstairs. It's fast, and there's *blood* coming from it. It turned me sick. And then I heard you, and came down. It's there *still*, Bobby.'

She sidled weakly into the arm-chair, her hand to her forehead.

'*Mean* all that?' asked Captain Chirk, after a frowning-fit. A steely light, as of robust interest, had come into his eyes.

'Every word of it, Bobby.'

''M! Sounds exciting. And some one else in the house who shouldn't be, eh? That'll suit *me* down to the floor. I'll be quite pleased to get a little of my own back on that same some one.' He rubbed his hands. 'Turn the key in the door after me, and await proceedings, old girl.'

A tender little skirmish intervened between this outline of a plan and its execution, but Captain Chirk won.

'You *will* be careful?' Regina implored, her hands upon his shoulders.

'You old darling!' said he. 'But not so much row. We're giving shows away, talking like this. When you've locked the door, just sit still—go to sleep or anything—till I knock you up. I don't anticipate much of a job, but you're sure to exaggerate it if you start thinking. So go to sleep, my sweet, if you can. Ssh!'

Smiling and waving a forefinger, he stepped into the corridor, and closed the door; and, partly in obedience, but chiefly because she felt like it, having locked the door, Regina returned to the arm-chair.

And there she sat, not of course even merely thinking of sleep, but—listening yet again. For other sounds now than the wind's screechings. Worse sounds, perhaps; indeed probably.

X.

She sat until patience and her nerves both gave out. Her imagination also spurred her into fresh action. Anything might be happening. There might be a gang of miscreants sown about the house—Bobby but one against a crowd!

Flushed by this ultimate fear, she rose, and, pistol in hand once more, after a furtive, yet sufficing, peep into the gloom of the gap in the panelling, unlocked the door. The gap itself proved to be comparatively a nothing. Standing-room for two or three, in untold dust—that was all. Priest's hiding-hole, or whatever it was, she forgot it as soon as she had inspected it.

In the corridor she paused, and was about to resume her listenings, when, clear above the wind's gabblings, she heard Captain Chirk's laugh, as free as a child's. The laugh swelled, then ended in the remark 'Capital indeed!' and something more which failed to reach her ears. Laugh and speech alike on an unmistakable note of irony—mellow irony—enjoyable to the producer.

Light as a dancer's, Regina's feet ran her back into the hall, and there she waited, throbbing, wide-eyed, and expectant of she knew not what, save only that it was something good. Nor had she long to wait.

'March, my beauty! Quick march, too, my noble Hun!'

Another laugh from Captain Chirk (a deep-throated 'Ha-ha!' this one) succeeded the lusty command. The cheer of the laugh was still upon her when Regina's amazed eyes beheld the

beginnings of a field-gray German where the staircase looped. Another moment and she was able to recognise the entire man. It was Megan's moon-faced slave from Bryntyn. His lower lip, hanging loose like that of a jaded horse, emphasised his abjectness, and he held a bandaged hand stiffly in front of him.

And then Captain Chirk himself came round the bend, no longer ignominious in the hated field-gray, but clothed as an officer of the Shropshires should be; wearing, further, a look of triumph which——

'Hallo, old girl!' he cried, as his triumphant eyes illumined Regina and her bewilderments.

Briskly passing his captive, he pointed the man to a stair. 'Sit down!' he ordered.

Then, with uttermost satisfaction upon his bronzed face, he grasped Regina's two hands, including the pistol, and hugged them to his breast. 'Old girl, I certainly am one of the fortunate ones, and there's just time to tell you so,' he began. 'Cheer up, dear. Don't look so *lost*. It's quite all right now—everything. *This* chap was your real burglar, not I. Having started his wicked day by clouting me on the head with a sling of rooties—taties, you know—he prowled in here. The chance offering, the ass reckoned my uniform would help him on his way back to his Fatherland. Finding an empty house, same as I did, he twigged another chance—of loot. Your return scared him into the armour. Then he got upstairs, and was trying what sort of a second hiding-place the chest might make, when the lid banged him on the head and nipped two or three of his fingers. Knocked him dotty, same as he'd done me. And that's enough about it at this present stage in our three merry histories. Congratulate me, old girl!'

Regina absorbed his news blissfully. 'Oh Bobby!' she panted as her head inclined to his shoulder. 'I do. I do. How thankful—and relieved I am!'

Indifferent to the melancholy and staring German, Captain Chirk kissed her hair. 'Same here, my dear old best,' he said. 'Same here, indeed!'

Never had Regina felt in such need of tendernesses, or found them so congenial; and for a while he was the perfect comforter. Then he proceeded to free himself.

'Awfully sorry, but I really must get this ruffian into the hands of the police,' he explained. 'But I'll look in again on my way back,' he went on in response to an objecting quiver from Regina. 'You get yourself some tea, with a drop of something strong in it—at once. And, remember, I'm here *all* to-morrow—every daylight minute of it.'

'A-h!' sighed Regina, with contented eyes.

XI.

A little more, and from the Gwynfrwyn porch, she watched Captain Chirk and Megan's limp-necked Hun disappear under the clock-tower gateway. Captain Chirk was to have the glory of that conquering march down the avenue, not she. Nor would she have had it otherwise. His last words, from a distance, were about his hunger for Gwynfrwyn food in about an hour. Regina had nodded and smiled heedfully.

. . . . . .

Purged from all anxieties, she returned to the hall and its cushioned window-seat. The gale's discords were lullabies now, and Old Sixteenth-Century nothing worse than a straw-stuffed guy.

. . . . . .

Time passed, and she was feeling momentarily more like her familiar self when she heard Mary Buckstone's voice and footfalls; the door opened, and Bucky entered, wreathed in smiles.

'Well, dear,' she greeted her colleague, dimpling serenely, 'here we are again, as the clown says.' She turned and beckoned. 'Come along in,' she said coaxingly, and a shame-faced girl joined her on the door-mat.

'Yes,' she went on, 'it's Megan come back, Colly. Aren't we *lucky?* And isn't *she?* That's what I've been telling her, poor kid! She had arranged to elope with that Hans Zwiller—conceive it!—but a merciful hitch or something intervened. He didn't turn up, and she says she'll never, *never* have anything more to do with a man as long as she lives. We'll take that with some salt, of course, but the essential thing is that she has her senses back; haven't you, Megan?—Well, dear, and have you had a nice, quiet time yourself? Why, what's the matter?'

Regina was laughing a whole-souled laugh—that was all.

THE END.

MOSQUITOES AND MALARIA.

WHICH is the most devastating of the diseases that attack man? Many will think of the white scourge, or the hidden plague; but probably the less-talked-of malaria—which is estimated to cause a million deaths a year in India alone—has best claim to the tragic distinction.

Malaria was long thought to be one of 'the affections that the sun sucks up from bogs, fens, flats,' but is now known to be due to a parasite transmitted to human beings by blood-sucking mosquitoes. In the warm evenings of summer and autumn, clouds of tiny two-winged flies may be seen flying in flat and marshy districts, those

which bite to some purpose being called 'mosquitoes,' while others that are less troublesome are dismissed as 'gnats.'

Light sleepers are often awakened by the peculiar sound—a sort of trumpeting scream—made by the mosquito close to the ear; and if one settles upon the back of the hand, its instructive motions may be watched under a pocket-lens. It is only the female fly which sucks blood, and nature has admirably fitted her for her deadly task. In her case the typical insect mouth-parts—which are not really jaws, but limbs—are modified to form a tiny but perfect set of surgical instruments. One part forms a case for six lancets with points variously shaped for piercing, cutting, and sawing. One is like a two-edged sword, with a groove running its whole length so as to convert the weapon into a hypodermic syringe.

Having pierced the skin, the insect injects a quantity of poisonous saliva into the wound, then sucks blood for about three minutes, and finally decamps. This is the beginning rather than the end of the mischief, for the injected saliva contains tiny jelly-like creatures which at once seize upon the red corpuscles of the blood and gradually devour them. Thriving upon their precious diet, the parasites split up into a number of smaller individuals, which attack further corpuscles, and in their turn attain full size.

Obviously the continued operation of this process would soon result in the death of the sufferer; but, fortunately, after a certain time the changed condition of the blood warns the intruders that active attacks must cease. Then they adopt a resting attitude, awaiting a further visit from a mosquito. When this occurs some of them are drawn up into the fly's stomach, and—stimulated rather than incommoded by the digestive juices—proceed to go through a further stage in their development and multiplication. Later on they are found in the salivary glands; and when the mosquito bites another human being, they pass into his blood with the saliva, and the vicious life-circle begins anew.

Doctors recognise at least three sorts of malaria or ague caused by three different kinds of parasites—all, however, transmitted by the bite of mosquitoes. The tertian and quartan agues are comparatively mild in their effects, and are hence called 'benign'; whereas the tropical form of malaria is continuous and 'pernicious,' and has earned for the deadly coastal regions of certain parts of Africa the title of the 'White Man's Grave.'

In medicine, understanding is the first step towards prevention, and following upon the pioneer-work of Sir Ronald Ross, great strides are now being made in the conquest of malaria. The mosquito may be thinned out by draining its native marshes or covering over the water-tanks in which the young live; or where this cannot be done, a thin film of paraffin-oil may be spread upon the surface of the water. The mosquito-larvæ are then unable to reach the air, and die of suffocation.

In treating patients attacked by the parasites of malaria, the value of quinine has long been recognised; although, strangely enough, to a small percentage of human beings quinine in any form seems to act as a direct poison.

THE PETERSON INHERITANCE.

By William Glover.

I.

IF some eccentric philanthropist were to devise his money to the Society for Providing Burglars with Up-to-Date Tools, the law would probably step in and divert the bequest. But there are other ways—not so glaringly obvious, though quite as effective—by which a legacy may incite to a breach of the Commandments; ways, moreover, with which the law generally refuses to interfere. Who has not heard of wills that simply bristle with temptations to the legatees, and that thrust the dead hand of stupidity or malice into the lives of coming generations? Take, for instance, the notorious Peterson case. It created a sensation at the time it happened; but, for reasons into which it is here unnecessary to enter, the instructive details have never, hitherto, been set down in correct perspective. The story runs as follows.

Cornelius J. Peterson, of Brownsville, a small township at the foot of the Rocky Mountains, had six sons. Of these, James was the eldest. The others, in order of seniority, were William Henry, Peter, Thomas, Washington, and Jacob. They were not nice boys. Each was handy with a gun; each had a taste, cultivated, yet not refined, for every get-at-able variety of intoxicating drink; but, according to public opinion, these were the only virtues they possessed. On one point there could be no dispute: these six sons had done their level best to make their father's existence most unpleasantly lively, and had succeeded in putting a great deal of vivid colour into what would otherwise have been a gray old age.

To the general surprise, Peterson, who had—and quite deserved—the reputation of being a most vindictive man, made little or no attempt at retaliation.

'I can't make it out, Corny,' said a friend, 'why you should treat those boys o' yourn so dif-

ferent from what you treat me and the other folk. Why don't you hit back? What keeps you from givin' 'em tit for tat—ten tits for one tat?'

'Put it down to a father's natural feelin's,' replied Peterson.

'You ain't got 'em,' returned the friend. 'Try another lie.'

Peterson chuckled. 'I never forget,' said he, 'and I never forgive. I'm savin' up somethin' for these boys o' mine that'll fairly make 'em jump. I've studied 'em, and sorter sized 'em up; and I know where to strike so that it will hurt 'em most. Just you wait till I hand in my checks, an' you'll see what I mean.'

'But you won't be able to enjoy it, once you are dead and gone,' remonstrated the friend.

'Who told you that?' returned Peterson. 'What do *you* know about religion?'

II.

In process of time this Old Testament Christian died. When his will was opened, it appeared that the whole of the estate—consisting of a farm of two hundred acres, a well-furnished house, and some fifty thousand dollars lying at call in the bank—had been left to the eldest son, James.

But there were conditions. James was bound to reside in Brownsville; and if, in any year—reckoned from the date of his accession—he should absent himself from the township for more than three calendar months, he was to forfeit everything in favour of William Henry, who would then inherit under similar terms.

Should the charms of foreign travel prove too strong for William Henry, Peter was to be installed. In the event of Peter failing to keep his hold on the reins, he must hand them over to Thomas. Did Thomas slip off his seat, Washington was to take the vacant chair. If Washington allowed his claim to lapse, Jacob got his chance; and if he fooled it away, what was left of the property went to the County Asylum for Deserving Inebriates.

Attached to this ingenious merry-go-round of a document, there was a further proviso that was not without significance to any one who knew the Peterson boys. Should the brother in actual possession die from disease, the estate was to pass to the next in succession—with conditions aforesaid; but should he come to his end by violence, intermediaries were passed over, and everything devolved forthwith upon the beforementioned asylum.

III.

The fortunate James had no sooner come into his own than he began to enjoy himself with all his might. He was a man of many wants, and now, quite regardless of cost, he left none of them ungratified.

The only item on which he economised was that of charity, and here he appeared to be obsessed by a conscientious scrupulosity. 'It wouldn't be fair,' he explained to the people who called upon him for subscriptions, 'if I were to give away what ain't altogether mine—money left to me, as it were, in trust. I have my brothers to consider, and it is only right I should safeguard their interests, so to speak.'

One by one, and in batches, these wretched brothers interviewed the considerate James, and implored him to extend his care for their interests a little further, and to refrain from squandering such huge sums on his own pleasures; otherwise there would soon be nothing left. But they found remonstrance worse than useless. James upbraided them with their selfishness, and grew more extravagant after each visit of expostulation. Being a man of little insight and prevision, he believed he could safely defy all interference; and he failed to grasp the fact that his tenure of office was not absolutely secure.

Three weeks—three glorious weeks—then the inhabitant of this fool's paradise suddenly disappeared. As time passed, without bringing any tidings of him, excitement in Brownsville ran high. Officious searchers scoured the district, but no trace of the missing man could be found.

Strange to say, the most cool and collected individual for miles around was the Peterson next in succession—William Henry. He left the place on the very day of his brother's disappearance, giving out that he was called away to take charge of a man who had gone out of his mind. When he came back, a month later, he laughed at the fuss that was being made. There was no doubt, he said, that James was in hiding somewhere; that he was staying away on purpose to raise a brother's hopes; and that the skunk would return at the very last moment in order to make the disappointment as acute as possible.

'I don't blame Jim, mind you,' concluded the moralist. 'In his shoes I should most likely do the same thing myself. But I'm not goin' to give him the satisfaction of havin' fooled *me*.'

IV.

If this theory as to the disappearance were correct—and it certainly bore the stamp of probability—then James must have made a miscalculation; for he allowed the three months' time-limit to lapse without setting foot in Brownsville.

William Henry had held the property a bare fortnight, when, walking at dusk along the bank of the canal, something hit him on the back of the head, and laid him out. He recovered consciousness to find himself, bound hand and foot, lying in the tiny cabin of a barge. First by canal, then by river, he voyaged down to New Orleans, where he was transferred to a cargo-boat just clearing for China.

As the vessel was on the point of departure

who should come down into the hold—where the victim of such dastardly outrage was roped to a sugar-cask—but the too-long-lost James! 'Bill, my buck,' said he, with a happy smile, 'I'm doin' for you exactly what you did for me. To do unto others as they've done unto you is Scripter; so *that's* all right. Good-bye, old chap, and remember me to the Chin-Chins.'

It says much for William Henry's sense of justice that when, four months later, he returned from Asia, he made no attempt to assassinate his brother James.

V.

Warned by the fate of his predecessors, Peter, the next tenant, took careful precautions against the family tendency to vanish. As a rule he confined his perambulations to his orchard and garden, and these he planted thickly with man-traps and spring-guns. He also bought three huge dogs, which he fed upon a diet of raw meat; and it was only when accompanied by these guardians that he ventured to take his walks abroad.

One night, however, he met with a serious mischance. Strolling round the lawn, after a supper consisting of a bottle of rum and a digestive biscuit, he was guilty of an inadvertence; he stumbled into a man-trap. The machine was in perfect order; he had oiled it himself that very morning. The spring clicked, and the steel prongs, jabbing him in the calf, brought him howling to the ground. His three dogs rushed up, and, failing to recognise their master in such an unusual situation, proceeded to do what they considered to be their duty. Fortunately the hired man came up in time to rescue the sufferer from the triple tomb that had already engulfed the greater part of his clothing.

When Peter recovered, he judged it expedient to change his tactics. Instead of existing miserably in a state of craven siege, he would make a bold sortie, and carry the war into the enemy's camp. He must shoot his three younger brothers, Thomas, Washington, and Jacob; for he felt that he would never be able to enjoy true peace of mind until they should be no more.

But before putting the enterprise into execution, the strategist rode over to the next town to take legal opinion as to whether the fact of his having immolated the three persons next in succession would invalidate his title. The lawyers assured him it would not, and strongly advised him to do as he proposed, and to get to work at once.

His last fond scruple removed, Peter set off joyfully for home. He had only eight miles to go, but it took him just three months and one day to reach his destination. As he rode through a thick grove masked men waylaid him, dragged him from his horse, and gagged him. They held him in the woods till nightfall, and then carried him off to a remote gorge in the mountains, where they chained him up in a lumberman's hut.

The twentieth-century Prisoner of Chillon crept back into Brownsville, as it were, a day after the fair; and his spirit was so broken by captivity that the poor fellow had not a grain of retaliation left in him. So far as Peter was concerned, Thomas might consider himself quite safe.

VI.

Fortified by a knowledge of the legal opinion that Peter had risked so much to obtain, Thomas now took action. He had several opportunities of shooting Washington and Jacob separately, but he allowed these to pass; for he knew that if he should cause only one of them to decease, he would find extreme difficulty in stalking the other. On the very first occasion, however, of his meeting the pair together, he emptied his revolver at them. They dared not imperil their chance of succession by firing back; so they dodged the shots as well as the nature of the cover would permit, and got away, Washington with a bullet in his right shoulder, and Jacob with one in his left leg.

Thomas took his disappointment in a more hopeful spirit than the situation warranted. 'Never mind,' he said to himself. 'No doubt it is all for the best. But I'll wipe the cowards out yet. Better luck next time.'

Fortune, however, is not prodigal of golden opportunities. The next time never came.

Everybody said the sheriff must have been heavily bribed. Such a thing as an arrest for attempted murder had never been heard of before; and when it came out that Thomas had been taken away upon such a frivolous charge, Brownsville was wrathful. There was some talk of a rescue; and the county jail, forty miles distant, would probably have been stormed had it not been that public opinion, once it had had time to cool, declared against any gratuitous interference with the course of the Peterson legacy. It would be presumptuous on their part—so one of the leading citizens put it—to meddle with the inexorable workings of fate.

Of course, Thomas knew he would eventually be acquitted; he was under no uneasiness on that score. At the same time, he recognised the fact that he stood in a position of considerable danger—danger of losing his inheritance; for those who had inspired his arrest would undoubtedly stretch the law's delays to the uttermost.

The captive's efforts to regain his freedom were energetic but crude. He would have shown better judgment if he had first attempted to bribe the jailer, and tried to brain him only as a last resource. By reversing this process he raised the official's price to a quite prohibitive figure, and the error caused him to languish in durance for nearly six months.

VII.

In due time Washington took the post of peril—that is to say, he succeeded to the Peterson estate. He was generally credited with having the best head and the best heart in the family; and now he showed his wisdom and goodwill by making a friendly treaty with his younger brother. In return for a handsome allowance, Jacob pledged himself to refrain from any attempt at abduction; and he kept his promise. Disregarding all remonstrance as to their lame and spiritless compact, the two brothers persisted in amicable relations; and their only rivalry was as to which should be the more riotously dissipated and recklessly extravagant.

At this juncture the trustees of the asylum—who had for some time been much exercised in their minds as to the institution's chances of benefiting by the Peterson bequest—called a meeting.

The chairman, in his opening address, said he feared they had been sadly neglecting their duty. They ought, in the interests of the helpless beings under their charge, to have taken steps for raking in the shekels immediately upon the death of the testator. If only they had wiped out James Peterson at once, everything would have been theirs, and the estate would not have been wasted in such a deplorable manner.

'Not so deplorable,' interrupted a dissentient. 'There 's been a good bit of fun for the money; and if we 'd stopped the game before it had well begun, people would never have forgiven us; we shouldn't have got another subscription for years.'

This opinion met with general assent; but, seeing that Washington and Jacob had entered into such an unworthy compromise, it was felt that nobody could grumble if the trustees should now intervene. But how were they to proceed?

The chairman proposed that Washington should be killed; and he offered to do the job himself, using any method of despatch that the meeting might dictate. The majority, however, were against such a drastic course. They argued that one of a band of brothers that had made things so gay and lively for a whole countryside must not be dealt with too harshly; and they carried a vote in favour of a measure more gentle than homicide.

VIII.

Next day a close carriage, accompanied by four stalwart warders, left the asylum and drove into Brownsville at dusk. Half-an-hour later it started on the return journey—with Washington and Jacob inside—and arrived at its destination without mishap.

The unhappy brothers were lodged in the violent ward, where their behaviour proved quite in keeping with the traditions of that wing of the building.

Dipsomania is a difficult disease to tackle. In Washington's case, however, the efforts of the doctors soon met with success; and the victim of alcoholic craving was able, after a comparatively short course of treatment, to leave the asylum with a certificate stating that he was completely cured. He took his departure after a residence of three months and two days, but he went away with no stirrings of gratitude in his bosom. That the trustees had deprived him of lands and money was, he said, bad enough—though it was a trouble that might be borne. But if the infamous scoundrels had robbed him of what, in the language of the poet, he might term his sole remaining joy—his love of whisky—he believed he would go mad.

Jacob was not so fortunate as his elder brother. With him the mischief had bitten deeper, and not until six months and three days after his incarceration was the young sufferer discharged.

'Git! We 've done with you, so you can make tracks as quick as you like,' said the head warder, as he opened the big iron gates.

'All right, fat-head,' returned Jacob. 'I bear no malice toward you. You 've only been doin' the dirty work you 're paid for doin'. But you can tell the blatherskites that run this show that I 'm on the war-path, and I 'm goin' to drop 'em, one by one, as soon as I can steal a gun.'

The adventures of the Peterson legacy were now virtually at an end; for, no matter what might happen to the individual trustees, nothing could now deprive the asylum of its just and lawful due.

But when the bequest came to be realised, it was found that farm and homestead had been mortgaged for more than their worth, and the dollars were every one squandered. So the well-meaning trustees, instead of replenishing the coffers of a deserving charity, had diminished its treasury by the cost of Washington's keep for three months and Jacob's for six. The intention was all right; the execution was all right; but, alas! for an ideal outcome one needs an ideal world.

SUNSHINE AFTER RAIN.

THE skies have done with weeping,
And the earth
With rain-washed eyes is peeping,
Half in mirth
And half in doubtful wonder,
At the clouds
The sun-rays kiss asunder,
Turning shrouds
To wreaths of fairy lightness,
Changing fears
To smiles of dazzling brightness
Born of tears.

THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

FOR me Seville stands for happiness. It lives upon it, and breathes it forth again for joy of all who dwell within its compass. One of our statesmen the other day turned upon some anxious people arguing upon a social problem and murmuring that surely they had a right to happiness, and he declared they had no such right. He bade them to remember the hundreds of thousands of our soldiers who had existed without happiness in trenches of France and Flanders, and all too often died in them. They having so suffered, why should we who lived because they suffered have the happiness denied to them? This seems a harsh rule for our living now; it exceeds the asceticism we have known. But there was another problem of happiness that was not discussed on this occasion, though probably it has been much thought upon, and that is, how to obtain or conduce to happiness from external fact and circumstance as we have been wont to do. What gave us happiness not long ago yields the sweets no more. Life and the world have been somewhat spoiled. All have discovered that in ugly things, in feverish, careless, thoughtless, sometimes savage ways of life, there is nothing of happiness, only just excitement and the depression of reaction. Then some of them have learned that, now as always, happiness can often come only from within, must be a thing of philosophy and thought, based on sincerity and truth, with a certain spiritual contentment attached to the sense of duty. Once before—careless days they were, but not like these—happiness of a kind was frequently derived from external things; but now it is different, for the mark of the world's agony is everywhere, and pursuing happiness from external circumstance is to chase a will-o'-the-wisp indeed. You move restlessly from place to place; they are different from before, but they are equal in their failure. But I know of one who was always the true queen of happiness, and none of her charm has fallen. Seville was ever famous for her happiness; it is undiminished still. Her external influence penetrates to your internal mood; it soothes and sweetens as it used to do. There is a magic in this city. Is it in the air, or the colourings, or the music, the soft languorous nights, the Andalusian women's flashing eyes and their dreamy motion, or comes it from the Guadalquivir or from the high Giralda tower of the Moors, who knew all the arts and practised them, and were themselves on occasion happy people? Or is it as a charm worked upon a city by the tomb within it of Columbus, who widened and changed the world? For this tomb itself within the great cathedral casts a spell upon beholders seeing the splendour of the conception of the Spanish artists, who placed the look of pride and none of grief upon the countenances of the kingly figures that bear the bier.

* * *

However it may be, it is Seville for happiness then and now and all the time. You may approach it for a happiness cure, just as for grosser things you might sip the waters of a spa. The influence of Seville, its healing, quickening, spiritual essences, are absorbed into the heart and mind, and we are made happy. There are a thousand reasons, and yet none that satisfies, except perhaps that, after all, happiness is a communicable thing, and all in Seville are happy. So one loves Seville. She is a delight to me as no other, and 'she alone charmeth my sadness.' *Sevilla mia!* Say it as 'Sevillya'; in its liquid beauty it is a name that suits so well. How lovely is my Seville! She is all brightness and vivacity. There are the flowers, roses and carnations called *claveles* upon every balcony, trailing from every *azotea*, each flat roof upon which the Sevillians sometimes in the evening rest, where tunes are made upon guitars. The colourings of this city are pale and delicate, white the basis of them all. There are pinks and pale blues for the shadings of some house walls and ornamentations, and contrasts are made in warmths and coolnesses. From the heat of an open spot in a *plaza* one moves away into a shady *calle*, and then at each few paces there is refreshment in the vision, so sweet and cool, of the *patios* abounding here as not elsewhere. With their soothingness of green and marble and trickling fountains, their changes in design and order, the houses fascinate, and we regard them as surely the perfection of human habitations. They seem as if they would promote a sense of well-being, of refreshment, of cleanliness of mind, and an exquisite refinement.

 [*All Rights Reserved.*]

There is the *zaguan* or vestibule at the outside, then the *cancel* or grating, and next the *patio* within, and open for all to see from the *calle*. But Seville is all delights. Often have I leaned from my balcony on warm and starry nights, the sound of the clacking of the *castañuelas* by girls and children coming up from among the big palms below, and marvelled again upon her charm. They tell you, and truly, in Seville that there are only three things that matter there—one being love, and another happiness, and the third religion.

* * *

The chief street of no other city has such a peculiarity, such an individuality, as the Calle de las Sierpes, the main street of Seville. Perhaps the Corso of Rome is the nearest to it; yet it is far off in comparison, for often there is a whirl of traffic down the Corso, but there is none of it on wheels in the Sierpes, only just a mule or some other four-legged creature ambling through it very rarely. Wondering how such a way as this could have come to be the main street of such a city, I think at last that it must be an agreeable and harmonious evolution, for I cannot imagine what other kind of street would suit Seville so well. It is a gentle, a charming, street; applying the common rule of contrariness, you would divine so much beforehand, since the name of it means in English words the Street of the Serpents, for once upon a time there was here a tavern with the sign of a serpent over it. Here in this street, as also in the Paseo de las Delicias, one observes the happiness of Andalusia in a certain sort of concentration; here there is a little of many things that represent the capital of Andalusia in its charm. It is a very narrow street; I take it to be about twenty feet in width, and the floor is laid with spacious flags. There are no side-paths, since, with no wheel traffic, none is necessary. It is in main features of construction and design like many streets in nice cities in other parts of Spain. Almost farther away from Seville than anywhere in the Peninsula is Corunna, in the north. A gentle city is Corunna, a certain cultural quality and distinction with it; but Galicia is severe in comparison with Andalusia. It lacks the scarlets and the golds, the jetty blacks, and the fires of women's burning eyes; and yet here in Corunna is one of the nearest things to the Sierpes, the Calle Real, the lounging-place, the place of the clubs, of the best shops, the heart of La Coruña. But it is no Sierpes. I have seen an automobile passing impudently through the Calle Real of Corunna, angering us, but doing it just the same. I would not say that no such thing has happened in the Calle de las Sierpes, but I have not seen and cannot imagine it. When, if ever, I see a thing like that in the Sierpes, another tradition, another charm, will have gone away. And until you experience it in these times, become accustomed to it, you do not understand how blessed is a street that tolerates no wheels. You come to know in the Sierpes that, while perhaps the early discovery of wheels was a first movement by the human race towards their distant progress, these wheels were to become as a passion, a fever, an obsession, always intensifying the desire for wheels, more wheels, faster and faster wheels—were to send men mad. Lounging in these Sierpian shades where the only wheels seen or suggested are tiny things in watches in the windows of the jewellers—these mattering nothing, for time is nought when happiness is all—you come to realise completely that wheels have been a leading cause not only of our progress, but of our afflictions and our troubles. For its lack of wheels, for the new and better sense of life that this prohibition yields, we love Sierpes well. Here in this charming *calle* there is colour of every kind; it glows in the Andalusian light and shade. The buildings are high, as suits the climate with its sun and its heat, and in the hot summer great *amarillo* awnings are stretched across the tops of the houses from one side to the other to keep the Sierpes cool and shady. As one goes forward to the Sierpes from the Plaza de la Constitucion one is intrigued a little in preliminary with a flower-stall at the corner, where the lady offers roses and carnations. The note of floral colour is struck often through the length of the Sierpes, and from the balconies up above. There are street venders of many things all along the way. The heart of their commerce is near the big lion's mouth projecting from the wall, into which we drop letters that go then by simple post from the Sierpes to our England. And here are the nicest shops. They are daintier, more delicate, have more of ease and elegance about them, than the shops of Madrid. In some are sold the *abanicos* (fans) and *castañuelas* with the pretty ribbons; there are some with the sweetmeats of Seville, the daintiest in Spain; good book-shops are here, and if you visit Spain and would take back a volume of Cervantes for keepsake, then for the love of fitness reserve the purchase for the Calle de las Sierpes. There are likewise shops of a stern utilitarian kind, selling things to wear. You know of the Barber of Seville, have loved the tale, conjured visions of delight upon the lively music fancies of Rossini? Here for you is the barber of Seville—many barbers and good ones, too, though I do not see that any shaves by the name of Figaro. There are here also three or four of the best clubs in Seville, established on the Spanish system, whereby clubdom looks from its main apartments through wide windows (which may be open and are level with the street) out on to the Sierpes, while all the world looks in; here, we suppose, being good men who have nought to hide from women of their family. There are most things for living and loving in this *calle*, and high above there are little birds in cages singing continually of

their own peculiar joys. Save for a few brief hours before the *madrugada* gives way to full *mañana*, the Sierpes is always full of people, but not to the point of crowding. We lounge and linger in it, feeling our Sevilla warming within us. Sedately is the way for the Calle de las Sierpes. Of mornings the loungers are mostly men, wearing in the *primavera* and the summer the big, hard felt hats with wide brims and tall crowns that are favoured on sunny days in the south of Spain. These strollers, if so they should be called, are often engaged with what they would consider serious things, such as politics, or matters of personal interest, or even business. In the afternoons the siesta claims the loungers, but later animation makes an upward move. To the dusk come the señoras and the señoritas in their high mantillas, with roses and carnations in their bosoms and their hair. There is gaiety and laughter then, sounds of music, the clacking of the *castañuelas*.

* * *

In a few years from now much of the old Spain will have passed away, but some parts of her will never pass; and let us rejoice for that. The warmth of Spanish blood will never cool, the generosity of Spanish sentiment will not fade, and the magnificence of Spanish dignity, without an equal in the world, will not diminish. One would turn from thoughts of stones and streets to something upon which the sun of Spain has had its full effect. One might make a chance remark or two upon what are, after all, among the finest things in Spain, the women thereof, and in these also there are superficially —and not that only—some important changes; indeed there are. But this is of itself a tremendous theme, and not a trifle for the end pages of a paper. It must be treated with qualifications; for example, the important point must be realised that there are no Spanish women, but women of different parts of Spain, Galician women, Castilian women, and Andalusian women. There is as much difference between the women of Madrid and those of Seville as between those cities themselves—which means that there is an immensity of difference. Indeed, there is more likeness between the Madrilenian and the Parisienne than between the former and the señorita of Seville. And it is not for me here and now to say which of the two I like the better; only—say so many with old John Gay—'how happy could I be with either.' . . . And, again, there is another difficulty in falling to thought upon the señoras and the señoritas, and it is one of which the histories of many authors' journeys to Spain bear impressive monuments; it is that of developing an excess of enthusiasm for these creatures upon whom the sun has left the reflection of its living rays as not upon the women of more northern parts. One would not, with so many warnings, succumb to such enthusiasms. There is the sad case of Théophile Gautier, who, having talked of that intentioned '*voyage en Espagne*' of his until most were tired of the project, suddenly departed upon it, and was all enthusiasm from the first moment. Let the gentle of France condemn the *corrida* much as they please, but from his first bull-fight Théophile Gautier lusted for more in every city that he visited, insisting that the world had no scene to match this one. Then you find him in Seville in raptures on the maidens there, the witchery, the devilry, the fire and life and leaping thrill of the quick glance from their blue-black eyes, as for a second they dart it upon a stranger, and then turn their gaze to the floor again. That glance, with its stab of sex, that momentary flashing of the eyelashes, came not as a custom from the soil of Europe. To the East it owes itself; the Moors and Africa are in it; the scents and the songs of Araby belong to it. And the Sevillana also has such dainty feet and such a pretty manner in her pacing as are to be equalled only in Japan. They say there are many women in Seville whose feet could be held in the hand of a child; and so with their hands, the neatest things. However, this is no place for rhapsodies. The Madrilenian young lady is a different creature; she also has her special charms. She has fallen to some extent under an influence of Paris, but for the Parisian gaiety and abandon, which scarcely appeal to her, she has substituted her natural dignity, that black-and-gold dignity as one thinks of it, which suits her best and adds enormously to her attraction. She is rare in her restraint, in her dignity; and in a new world where there is so much less of both among the general womenkind, one is impressed by the magnificence of its effect. There is a disposition, as it seems, in London and Paris to copy some of the features of the Spanish ladies when 'tis thought it can be done, in cloaks and head-dress, and other details. It is well enough, perhaps; but it will be long before any other European can carry these things of Spain like the Spanish lady. To French and British eyes and minds the mantilla, perhaps, seems something a little freakish; but see it worn in the streets of Madrid and Seville at Easter, and realise that here is a device for the increase of dignity and charm such as no other people has ever thought of. However, a feeling again that this is no place for rhapsodies; there are yet more things that should be said; and so one turns to a most intimate companion, who has studied, as objects of the highest and most absorbing art, the women of France, of Italy, of America, and many other countries in their native walks, and one asks this careful and discriminating student, whose judgment can be trusted, for a considered appreciation of the Spanish women whom well he knows, and he, not an unduly impressionable fellow, supplies it.

* * *

Let us quote this Authority, then. He says it is his carefully formed opinion, stated in calm

and unimpassioned moments, that a prime feature of the new establishment of this Spain, aspiring to resume her old high place in the world, is the new Spanish señorita—particularly, as he considers, the lady of Madrid. The new señoritas, he says, are not like those of old; not as those before the war. They are very different. He had had opportunities of considering the 1914 señorita in her native land; she embraced all the intrinsic qualities, for new strains of humankind are not accomplished in six years, but they were comparatively undeveloped. The pre-war señorita was in a sense the raw material, as Spain herself, waiting for the grand occasion, the magic touch, when she should be transformed to the highest. And just as Spain sprang to the opportunity of the war, so the señorita also rose in six years to a height that in other circumstances might have needed generations. She was ready for the advance, says our friend the Authority. The Spanish families of the present generation have travelled considerably and widened their ideas; they have been sending their children to school in France and England; you might be surprised at the number who know England well. They have cultivated new manners, and a taste with them. But, above all, they are fresh; they seem to suffer less than others from the wracks of our terrible civilisation; they are not nervous, jumpy, craving for excitements, though they can enjoy pleasure as well as any. Never—so Authority tells us confidentially—has he seen women more charmingly, more bewitchingly, attired than the new señoritas of the better classes in Madrid, and yet it is exceptional for any of them, morning, noon, or night, to be dressed in anything but black. They know the heights they can achieve with their traditional Spanish black. And it is not without a cause that one of the foremost Parisian modistes has recently built a veritable palace, one of the finest of the new commercial houses, in the Carrera de San Jerónimo. From this point in his calm and considered judgment, our Authority expresses himself with more emphasis. He states deliberately that the Madrilenian girl of good breeding and modern training is a wonder, a dream; that she is like nothing else you and I have ever seen or thought of; that her manner and her charm are perfect. He considers that much of her attraction is due to the fact that, while art—the artistic feeling, sense, consciousness—pulses through every being in this land, the señorita of Madrid, risen now to the achievement of her finest individuality, exercises that prime canon of all art, which is restraint. Magnificent in her quality, in her power of fascination, conscious of her feminine force, she can afford restraint, and be the more forceful for it. When the time comes she may surpass all other women, so many of whom have fallen farther than they know through their extravagances, their excesses, and their stupid liberties. At different periods this Authority thought the Italians had it with their women; then the young Parisiennes. There have been days in New York when, watching some of the daintiest things tripping along the Fifth Avenue in the sunshine, seeing how, with a marvellous American acuteness, they had attached a fineness of France to their Anglo-Saxon quality, he thought that the young American girl was to be the joy and torture of the world. He says that for obvious reasons he will leave out of these considerations the girls of Britain. He is sure that the Spanish señorita has the measure of the rest. She may be feared as much as the new Spanish energy and enterprise, rising up after the long sleep this people has had, ridding itself of its troubles; she may be feared more than the untold riches that lie in the bosom of the Spanish soil, more than the millions of pesetas in gold that are cellared in Spanish banks and are being increased constantly by the ships that come to Spain, more than the new democracy (with Don Alfonso in sympathy) that surges in this land of the old grandees. Gold and commerce, worldly ambition, are most powerful things, but a living woman is another matter. These new Carmens, says Authority, always make him think of Cleopatra. He feels that the time is coming on when these new señoritas will go out into the world, jealously as they are now kept in Spain, for the men of other lands will want them, and, as one might say, these men will combine business with pleasure to their heart's delight, seeing the new commercial, economic, and political position that Spain is assuming in the world. And every one of these señoritas, ceasing to be a señorita, will be a unit of Spain, flaming, burning in spots in the world outside. Already they are being seen more than ever before in Paris, in London, and in New York. The Spanish politicians say that Spain must withdraw from her isolation, must go out into the world; the Spanish girls are disposed to give a lead. But Authority, fearful of conveying any wrong impression or of insufficiently enforcing certain points, returns to the matter of restraint. Spanish family manners and customs have always been strict and straight; so do they remain. The señoritas are carefully watched and guarded by their parents. Etiquette is rigorous; the girls have little licence, but enough; they are not like the children of the countries of the war. And, observing them in all their dignity, their care, their self-possession, their charm, but again in their young feminine dignity, he sighs and wishes all others were the same. He tells me that one night not long ago he watched them pensively at a great social function at the palace of a nobleman, and how in their freshness, their new life, they did enjoy themselves. Here he said was '*la joie de vivre*' as girls gone mad in other lands knew nothing of! On Monday nights the most fashionable hotel is practically reserved for a general social

function of good Madrid society, and here the young ladies are to be seen in similar conditions, but with perhaps a shade less of restraint. This has been as a kind of social class or school for the new development; the new and fine hotels have become centres for meeting and comparison and rivalry such as Madrid lacked a few years ago. But, Authority warns, Europeans and Americans are not to think that the old Spanish feminine soul no longer burns. Look, says he, upon these rare complexions, transparent ivory with olive showing through—and rarely is a touch of powder seen upon them—the perfectly moulded features without sharp, angular points, the true black hair and eyes, most piercing eyes, and here are seen fire and flame! Here is the Spaniard still, finer, quicker, keener than e'er before. This lady is such a one as men would risk kingdoms for. Authority has seen nothing like her; considers she is an improvement on Cleopatra. The Spanish men know her tremendous value; they know it well. . . . And here Authority pauses. His statement, despite its rhapsodies, is one of fact; it may be taken as official. Still, on perusal of it in Madrid, it was considered right to give hint to our Authority that it was time he was going home.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER IV.—*continued.*

VIII.

WHILE they were waiting to catch the connection at North Bay, Clement Seadon saw a man dodge out of the station telegraph-office. He came out furtively, saw Clement near him, hung hesitating, and then, with the movement of a weasel, snapped back into cover behind the telegraph-office door.

Clement walked away, but, always, he watched that door.

When the train for Cobalt drew up, he handed his bag to the black porter of his car—and still kept his eyes on the door. The young detective who accompanied him paused as he entered the train, and stood watching Clement's antics. Clement heard him speaking over his shoulder. He mounted the steps of the train backwards. He said, 'Ah, Gatineau, you 're there. Glad of that. Just keep your eyes on the door of the telegraph-office, will you?'

The train began to pull out. A head appeared round the door of the telegraph-office. The dark, swift eyes in the head scanned the train and the platform. Clement felt that, shrewd though that glance was, he and Gatineau were well screened by the side of the train. One look, and the head was followed by a lithe, sinewy figure. This figure crossed the platform at a swift, loping run, jumped to the steps of a car farther back, and pulled himself into the train.

'You saw him?' said Clement. 'That was Siwash Mike. He 's travelling with us to Cobalt.'

They went to their seats in the train. Clement sat facing back so that he could see any one who came forward through the train. He thought Siwash Mike would lie low, but these rogues were so bold and unscrupulous that he meant to be ready for all emergencies.

'I was rather startled to see him,' he said to Xavier Gatineau, 'but, of course, I should have expected him. He has been following me from Montreal, without a doubt.'

'Yes, in worrying about other things we forgot him,' admitted Gatineau. 'He complicates matters. He 's probably given warning of our movements. He 'll have sent Neuburg word that we are coming to Cobalt. He was probably doing that in the telegraph-office.'

The young detective's surmise was a natural enough one. But it happened to be wrong—as they found out later. Siwash Mike had sent his message of their coming to Neuburg when they left Montreal. He had gone into the telegraph-office at North Bay for quite another reason. But Clement and his companion were not to know that. They simply formed their deductions on the material they had, and as the material they had was limited, their deductions were wrong.

'Yes, they 'll know we are coming; they 'll be prepared for us. And we can do exactly nothing,' said Clement bitterly.

'Let 's try and think what they 'll do to checkmate us,' said the detective.

'That 's easy,' said Clement. 'They 'll do what they 've been doing or attempting to do ever since this affair began. They 'll get Heloise —Miss Reys '— he could not help speaking of her by her Christian name only: it was the way he thought of her—'they 'll get her out of our reach.'

'Not easy in a smallish town like Cobalt.'

'Then they 'll take her outside Cobalt—take her away.'

'But—but can they move her about at their will like that? She 's an intelligent woman. Wouldn't she object? Wouldn't she see something wrong in this constant repetition of these tactics?'

'They 'll be plausible,' said Clement. 'Their excuse will be logical. You must remember, too, that this Gunning fellow is not supposed to know she is coming to him. However erratic

his movements may seem, they're his own, or appear to be his own. If they tell her at Cobalt that Gunning has left the town, gone off to a shack, or a mine, in the wilds, she can't say anything. That's the sort of thing he *would* do, and she has to adapt herself to his journeyings. That's how they'll get her away. Gunning will go off somewhere—and she'll follow.'

'It's a tough problem,' said the little detective. And both men fell silent, thinking this tough problem out. Clement had been thinking it out, indeed, all through the long journey that skirted the quick blueness of the Ottawa River. The scenery; the endless ranks of spruce; the gaunt white skeletons of woods smitten by forest-fires; the hard and bitter rock that shouldered its way through the thin soil; the sudden and delightful sight of clearings and homesteads, with their pretty verandaed houses and their lack of hedges; the abrupt swinging into the astonished view of little lakes set like jewelled floors in some deep wood, of keen and bustling rivers fighting a flashing way over wide shingly beds, of deeper streams, their surfaces solid with the corrugation of timber 'booms'—all these sights were old friends of his, but he did not pay them any attention. He had simply threshed and rethreshed out the problem of what was to happen when they arrived at Cobalt.

To arrive at Cobalt was one thing. To find and speak with Heloise was another. She might, of course, be staying in one of the hotels, and then to find her would be as simple as going through the room-register, after asking a baggage-man or a railway-man where she was staying. But the probability was that she would not stay at a hotel. Neuburg could be trusted to avoid that risk of giving an easy clue. He would take her somewhere else, somewhere perhaps remote, and then the difficulty of tracing her would be great. Neuburg would see to it that there were none of the ordinary clues—there would be no cab or car driver to tell where he had taken the girl. He and the detective would have to hunt for her harbourage. That would not only mean loss of time; it would also mean the chance of their presence being observed—and then the work would be undone. Heloise would be whisked away once more; they would have to begin all over again.

That was how Clement had thought out the problem on that long journey westward, through country that had steadily grown more wild as the day lengthened. It was the problem he was thinking out now as, through the night, they passed up along the railway to the rocky, barren silver country in which Cobalt stood, a savage land of rocks and lakes and mine-slime, and active and derelict mine-workings. And he was thinking that now there was an added complication to that problem. The rogues knew they were coming, because Siwash, who was on the train, must have warned them. They would be prepared. Then suddenly, as he thought things out, thought of the new aspect Siwash Mike's presence on the train had given to the case, he smiled. He smiled with satisfaction, and said, 'By Gad! it's just luck, after all.'

The little detective looked at him sharply. He answered that look by saying, 'From our brother Siwash's antics do you gather that he thinks *we* know he is on this train?'

'Why, no,' said the detective. 'From the way he acted I reckon he thought we hadn't seen him, and he hoped we shouldn't.'

'That's my conclusion,' smiled Clement. 'He has us under his eye, and expects no guile from us, simply because he thinks us innocent of his presence. And that's going to help us. In our innocence, we'll make use of his innocence.'

The detective's eyes showed that he hadn't grasped what Clement was driving at.

'This is what I mean. He, personally, fears nothing from us. He is confident that he can do his job without any suspicion or threat to himself. Now, what is his job? It's to shadow us to Cobalt, see us safely there, and report. Do you agree with that? I mean, do you think there might be something further for him to do?'

'No,' said the detective, with thought. 'I don't see what more he can do. They'll naturally want to hear from him exactly what we've been doing. He'd probably turn us over to another man; or if, it being night—the dead of night—we went to the hotel, he'd judge we were safe for an hour or so.'

'And we'll arrange that he thinks that. But the point is that you agree he'll report. And whom to?'

'Why, to Neuburg—the gang.'

'Yes—he'll lead us to them,' smiled Clement quietly.

The detective looked at him, and then smiled in return. 'Say, that's pretty snappy thinking. Tell me the idea.'

'It's based on the fact that he thinks we don't suspect he's following us. Now, this is my plan. When the train stops at Cobalt, we'll delay getting off until the last. That'll thin out the other passengers who alight.'

'There won't be many, anyhow; there rarely are here, and at this time.'

'Well, anyhow, we'll make it easier for you to spot him, to fix him in your mind.'

'I've got him already,' smiled the detective. 'That's our job, you know—to remember men. There's your description of him—and I saw enough of him myself at North Bay. I know him. I won't miss him.'

'All right. But, anyhow, you'll get a chance of picking him up easily if there are fewer people about. When we get on to the platform, and he has a chance of hearing all we

say, and you have your chance of seeing him, I'll arrange in a loud voice to have both the bags carried to the hotel. I'll call out for the hotel baggage-man, or tell a porter to carry the bags. Then you will say to me (for, remember, we don't suspect he's there; we don't suspect the gang knows we've come to Cobalt), also in a loudish voice, that while I'm reserving rooms in the hotel, and asking questions, you'll have a word with the station-master. I'll agree to wait in the hotel lobby until you come to me.'

'And Siwash Mike overhears it all?'

'Siwash Mike overhears it all. And having overheard all that, he'll do one of two things, I think. He'll either shadow me, as the person he's most concerned in, to the hotel, or put another person on to me to follow me to the hotel—if there is another person; or he'll decide that we're safe for a short while, and so go off to report to Neuburg.'

'And I?'

'You keep your eye on Siwash all the time. You follow him. If he follows me to the hotel, follow him. . . . I shall go straight there unless I get some signal to join you. If I am in the hotel, I'll manage to keep my eye on the door all the time, so that if he moves off I'll take a signal from you and join you at once—I know you've an electric-torch. If you shine that, I'll come out. But I'm rather hoping that if he feels certain we don't know he's here, he'll go off at once after hearing our conversation about the hotel, and will trust his luck about getting his report in before we stir abroad. If that's the case, then we will both follow him. . . . We must plan a way for you to call my attention, should I have already gone towards the hotel.'

'That should be easy. You have to go up a pretty steep hill to get out of the station-yard. The hotel is just across the road. From the hotel door you should command the approach. If you've not reached the hotel by the time he goes off—well, I should pass so close that I should be able to get you a warning. . . . But—but—he might go by car or by rig.'

'That would be the devil'—— began Clement.

But the detective cried, 'No, I don't think it would. If he got right into a car or a rig, I should know at once what he was about. I'd take one of the other cars that are sure to be there, and that steep hill in the station-yard—well, it'd check his car, and enable me to pick you up, say you were still on it, if you hadn't seen for yourself he'd taken a car.'

They talked out the general line of this plan, and the more they talked the more satisfactory it seemed. They would get to Neuburg's headquarters by following the man who was trailing them, and who felt secure because he thought they didn't know he was trailing them. There were, of course, dangers and difficulties bristling along the line of their proposed action.

'What if they do put another man on to shadow you?' the detective asked.

'We'll have to deal with him—as the contingency arises,' said Clement grimly. 'It is a risk we can't avoid.'

'And we must beware of traps.'

'We must,' said Clement with a smile that was yet more grim. 'But, trap or no trap, I'm going into it. But I'm going in with my eyes open, prepared for anything.' He patted his pocket where reposed a new pistol The Chief had given him. 'I'm going in with my hand on the trigger, ready to shoot. I'm going in with an electric-torch. I'm ready for all tricks—and I'll have you with me. Armed, I suppose?'

The little detective's hand went down to his pocket. 'Automatic. Brother to the one The Chief gave you. And a good supply of magazine-refills.'

'The two of us ought to be able to deal with them. But I don't think there'll be a trap. I can understand how I tumbled into one before. I gave the game away, I'm certain, by sending Joe Wandersun's name in to Méduse Smythe at lunch. Neuburg put two and two together, guessed I'd overheard through that bathroom door, and so laid the plot for my fall. But here—how could there be a trap? So far as they're concerned we're entirely unaware that Siwash is on the train. Anything that we do will be a bolt swung out of the blue. . . . There's no reason or time for them to prepare traps. We'll simply carry the day with surprise tactics. Oh, we'll be thoroughly on our guard. We shoot at the slightest hint; we are warned by previous actions, and will take no risks. . . . Only, I hope there won't be any risks. I hope they'll be so sure of themselves that we'll score before they know what's happened. And, in any case, *is* there any possible other course of action open to us if we are to rescue that girl effectively and without loss of time?'

There was no other way. Now that Siwash had warned the rogues—as they thought he had done by telegraph from North Bay—that Clement and his companion were arriving at Cobalt, there was precious little time to lose. Neuburg would be for moving the girl Heloise at once on receipt of that warning. The only way to get to Neuburg and the girl Heloise was to follow Siwash. There was no other plan so swift. And its boldness, Clement thought, must make it effective.

He would have been less sanguine had he known that in the telegraph-office at North Bay Siwash had not been sending a message, *but receiving one;* that he had been fulfilling the instructions in that message at the moment that Clement saw him come out of the office, saw him hesitate; that, far from Siwash thinking that Clement did not know he was on the

train, the half-breed Indian was perfectly aware that Clement *did* know of his presence. If Clement had known all these things he might have hesitated. But he did not know.

He did not know. And when a closed car passed him groaning at the steep grade of the station-yard hill at Cobalt, and following that car came another, with a man—his man, Xavier Gatineau—leaning out of it and calling to him, 'Get in; get in. He's in that car in front. He's swallowed our bait. He got into that car the minute you began to walk out of the station'—directly these things happened, Clement gleefully congratulated himself that their little comedy of deception had proved brilliantly successful. He scrambled into the car through the door Gatineau held open. He fell back into the padded seat smiling. He watched the red rear-light of the closed car in front picking up speed as it wound through the corkscrew streets of Cobalt. And his heart was saying, 'To Neuburg. . . . To Heloise. . . . That car's leading us to them.'

And in the front car Siwash Mike was chuckling. He leaned across to Joe Wandersun, who was driving, and cried, still chuckling, 'They 've bitten. They 've bitten. They 're following.'

INSECT-LIFE IN THE VALLEY OF THE AMAZON.

By Herbert Luss.

RIGHT across the vast continent of South America, from the Andes in the west to the shores of the Atlantic in the east, the mighty Amazon rolls its broad, deep current, and it discharges a greater volume of water into the ocean than any other river in the world.

The entire length of this noble stream, measured from its source, far away in the Peruvian Andes, probably exceeds 3600 miles. The tide ascends the river to Obidos, a distance of 400 miles; while for nearly 2000 miles there is depth of water for vessels of almost any burden.

The estuary into which the Amazon widens at its mouth is from 160 to 180 miles in breadth.

Magnificent forests clothe its banks, and abound with trees of gigantic size. Many of its tributaries are larger than the great rivers of western Europe, and some of them are equal to the Volga. The moisture which is carried from the Atlantic by the trade-winds annually descends along the valley of the Amazon in deluges of rain, causing the river to overflow its banks, and covering with its rising and spreading waters an immense extent of country. In consequence of this periodical irrigation and these heavy rains, coupled with a burning, tropical heat, the vegetation of this extensive region is so profuse that trees, shrubs, and flowers are often intertwined with parasitical plants so as to form impenetrable fastnesses. Nor is the animal-life less prolific which is nourished amidst these dense forests and hot, humid plains. Alligators haunt the waters; birds of brilliant plumage and countless number, and monkeys of various tribes, throng the woods; and the jaguar, or South American panther, lurks in the close-matted vegetation.

Some idea of the exuberant fauna of this valley of the Amazon will be formed when we mention that one traveller, after eleven years of industrious exploration of a portion of this territory, collected fifteen thousand specimens of mammals, birds, reptiles, fishes, insects, molluscs, and zoophytes, of which eight thousand were new to science.

It is, however, only with the intense development of insect-life we are at present concerned. Of the various tribes which here swarm in countless myriads, ants are among the most numerous and remarkable. One of these, called the Suaba ant, infests some districts in almost incredible numbers. They are greatly dreaded, and commit most destructive ravages on trees, vegetables, and field-crops, not to mention other depredations. Their hills are sometimes forty yards in circumference, although carried only two feet high. These are dome-like coverings to extensive subterranean galleries, which are carried to a great depth, and are spread out in wide ramifications. No contemptible sappers and miners are these Suaba ants, for we are told that they excavated a tunnel under the bed of the river Parahyba, at a place where it is as broad as the Thames at London Bridge.

Another species of ants are winged, and at certain seasons abound to such an extent that after a sudden squall which has blown them into the river, they have been seen heaped up in a line at the water's edge for miles. Another species of the hymenopterous family are known pre-eminently as the 'foraging and predatory ants.' These are found in the neighbourhood of Erga, a town near the junction of the river Teffe with the Amazon; and so dreaded are the fierce attacks of these rapacious insects that the natives, whenever they can, fly from their approach.

In one part of the course of the Amazon is a sort of gadfly, which displays a strong and very inconvenient predilection for human flesh, 'as a breeding-place for its grubs.' The presence of one of these grubs in arm or leg is known by the appearance of a painful boil, which, when opened, discloses a creature an inch long, snugly

secured in its nest by two horny hooks. It has, fortunately, been discovered that tobacco-juice sharply injected will dislodge the intruder in a trice.

Great varieties of bees are met with; but it is remarkable that in the construction of their combs they do not display the same architectural symmetry and skill as their European kindred.

Conspicuous among the insect families of this river region, and distinguished for extraordinary beauty of colour, 'the rich hues of all glorious things,' is a profusion of various kinds of butterflies. Within an hour's walk of the town of Pará no fewer than seven hundred species may be found! In the British Isles only about sixty-six or seventy species are met with, and in the entire European continent perhaps not more than three hundred and ninety.

One of these butterflies, the *Morpho rhetenor*, sparkles with a lustre almost dazzling to the eye, but as it rarely approaches the earth nearer than twenty feet, it can seldom be caught. The upper surface of its wings is a bright blue, and they flash in the clear sunlight, often making its course visible for a quarter of a mile. Some of these beautiful creatures have their wings bordered or spangled with lines and spots that look almost like burnished gold and silver. The wings of others are transparent as glass.

On moths, and mosquitoes, and dragon-flies, and beetles, and spiders (some of which are so enormous that they weave their webs to catch birds instead of flies), and on other forms of life, we have not time to dwell. We have only been able to give a glance at a very few of the wondrously varied tribes which crowd the vast belt of country spreading on both sides of the Amazon.

À BON CHAT, BON RAT.

By 'IGNOTUS.'

I.

THE sun had been blazing down fiercely the whole morning from a sky intensely blue, unrelieved by a single white cloud, though ever and anon a little puff of air moved the edge of the tent-fly, drawn aside to admit the passage of any wandering wind that might be stirring.

Across the aperture so created, like moving pictures come to life, passed, with its unhurrying, leisured pace, all the immemorial traffic of the East: now a barefooted woman veiled in black, balancing on her head an earthen pitcher; now a native on a donkey, seated far back on the beast's quarters, crooning a song as he rode, and only interrupting himself to bestow an extra thwack of his stick on its ribs; or a long string of camels tied head to tail, the leader bearing a figure in a blue *galabieh* and a white-turbaned tarboosh, who sat cross-legged as the string lurched and padded its apathetic way across the gap. These simple, everyday sights, the reflection from the yellow sand, the gently rustling date-palms, and the blue haze of the hills in the far distance seemed to appeal with extraordinary force and fascination to Marsland, thin and sun-tanned in his khaki drill and faded medal ribbons, as he rose from his table to lean against the opening, puckering his eyes against the glare.

'By George! it 's a corker this morning, Jerry,' he remarked, snuffling at the light breeze like a foxhound.

'I don't know that one isn't better off inside a tent to-day, even though you are tied by the leg to your desk.'

Charles Stanley, the man so addressed, and known to all and sundry as Jerry, owing to a very elusive and fragmentary resemblance to a former light of the Prize Ring, looked up from his work and smiled. 'Doesn't much matter what you think, old son, does it, if you 're detailed to the job?'

'Oh, I don't know,' yawned Marsland reflectively. 'If one asked to go back to one's regiment and really made a fuss about it, I suppose one could shove it through.'

'Not you, old boy. You 're something of an asset with your knowledge of Arabic and the native—rather too much so for any self-respecting general to pay the slightest attention to your wishes. However'—he interrupted himself—'I 've got all this list of bad-hats to go through before luncheon, so I can't afford to waste much of my sweetness upon you.'

'What are you doing, Jerry?' inquired Marsland, with rather more animation than he had hitherto displayed.

'I 'm engaged in the compilation of a register, my dear man, if you want to know, of all the most unmitigated blackguards between the east bank of the canal and Damascus. You, who know the country even better than I do, will realise that hardly a day passes that I do not cull some bright, particular gem to add to my Rogues' Gallery. At the moment I 'm developing the life and times of one, Ahmed Hussein, who, having come across to us from the Turks at Gallipoli on the plausible plea of desertion, but actually to spy, was drafted into the E.L.C.* in the days when we were still green, tender, and succulent; and having done as much damage as he possibly could during the ensuing twelve months, promptly redeserted to the Turks

* Egyptian Labour Corps.

when we re-formed line on the Suez Canal. He's evidently regularly employed by their Intelligence Department, for he was recognised by one of our agents this morning in the native market at Ludd, selling oranges, as bold as brass, with a forged pedlar's licence signed by an A.P.M., and is at the moment safely locked up, pending disposal.'

'What are you going to do with the beggar? Shoot him?'

'Don't quite know. It's no use trying to turn him on to work for us, for you can't trust him a yard. On the other hand, if you shoot him you close his mouth for good. In a way, it might be a good thing; but that would prevent his giving away his late employers, which that sort generally does sooner or later. I must say I like the Turkish way of dealing with these gentry.'

'You mean licking 'em, Jerry?'

'That's the little notion. Tie 'em up and give 'em a couple of dozen, and then check what they say by your other information, and if they lie, as they nearly always do, lick 'em again, and they generally cough up the truth. But one can't do that, as you know.'

'He might do for me,' said Marsland. 'I want to send a message to Williams in Damascus. Would he take it?'

'Yes, straight to their Intelligence Headquarters. I tell you, you daren't trust him; he's too crooked. I shall either send him to an internment camp for the rest of the war, or else let him see what's going on now, lock him up for six weeks' quarantine detention, and then turn him loose one night to fill up the old Turco with stale truth. They're as useful that way as any other, and, thank goodness! the Turks don't realise it as yet.'

Before Marsland could reply, the flap at the other end of the tent was raised, and the chief clerk entered with the midday post; whereupon both men settled down to read their letters.

II.

'Sergeant West!' called Marsland. 'Where are the files relating to these letters? I've told you about that before, and I do wish you would try to remember it's no use bringing in letters without the previous correspondence.'

'Very sorry, sir; I'll go and get them,' replied the sergeant.

'All right; and send in Abdul if he's about.'

'He's in the clerks' tent, sir. I'll send him in.'

A minute passed, and a deep-bass voice boomed outside. '*Effendi?*' it said interrogatively.

'*Khush*' ('Come in'), remarked Marsland absently, immersed in the details of the papers spread out before him.

'*Neharak saida, effendi*' ('Good-morning, sir'), boomed Abdul Hassan, entering, and waiting for his master to speak.

A man of rather above the average height, finely made, so far as could be seen from the movements of his loose olive-green *arbaya** edged with an elaborate braided trimming, the universal tarboosh on his head, and green slippers of native leather on his feet, that slopped gently as he moved, he presented no feature out of the common from the millions of natives about him; while a pair of piercing black eyes, gazing intently underneath penthouse-shaped eyebrows in a nut-brown face contoured with myriads of tiny wrinkles, a carefully tended white moustache and beard, afforded no visible clue to the loyal and cunning brain beneath, for Abdul Hassan, chief of the Intelligence agents, was of the *vieille souche*, devoted body and soul to Marsland, in company with whom he had been in, and had got out of, some very awkward corners.

'*Said mubarak, ya Abdul. Ezaiyak?*' ('Good-morning, Abdul. How are you?'), replied Marsland.

'*Elhamdo lillah*' ('Thanks be to God, well'), boomed Abdul.

'Look here, Abdul,' remarked Marsland; 'I want to talk to you. I'm not satisfied with the way the agents are working at present. The last two men we sent across to the Turks were due back here to report two days ago, and neither of them has returned. Either they have given us away to the Turkish Intelligence, or they've been caught, and whichever way it is, it's not much to our credit, for we can't afford to get our agents trapped. The net result is, we've had no news worth having for several days, we're two men short, and the general's very much annoyed. Have you any ideas on the subject?'

'I always had my doubts, *effendi*, about that son of a dog, Hussein. He used to grumble a good deal in camp about his food, though he got just the same as everybody else, as your Honour knows, and he's a fanatical sort of man at the best. He comes from Tantah, which, your Honour knows, is a hotbed of disaffection, and always will be; and my belief is that he had been screwing up his courage for some time to desert, and that he persuaded Ibrahim, who is but a boy, to do likewise, and when the chance came he took it. *Yinal abu-u!*' ('May his father be accursed!'), he finished fervently, spitting on the ground in the intensity of his disgust.

'*Fikrak?*' ('Do you think so?'), responded Marsland. 'Well, I dare say you're right; but it's no good crying over spilt milk. We won't take any more men from Tantah, no matter how good their credentials are, but we *must* get a couple more at once to take their place, and meantime I'll ask the *genabel kaimakam* [worthy major]'—nodding across at Stanley as he spoke—'to put them both on his black-list. Send

* A native robe worn by the better type of natives.

Jussuf out to-night as soon as it gets dark to go across and see if he can find out what has happened to them, and go into the *suk* [native market] this afternoon and drink coffee with Mursi el Kozack, and try to find out if any enemy agents have come in.'

'*Taib, effendi*' ('Very well, sir'), said Abdul, as he salaamed and left the tent.

'That's rather a jolt,' commented Jerry, as the native departed. 'Because, as you know, with this contemplated move, the chief has been more than ever anxious to prevent news leaking across, and this might mean a lot of unpleasantness. By-the-by, you spoke just now of wanting to send a man up to Damascus, didn't you? What do you want him to go for?'

'I want to send Williams a message,' replied Marsland curtly.

'What's wrong with the ordinary way, old boy? I'm sending an agent up to-night in the *Sparrowhawk*, and she's going to drop him off Jaffa if the green shutters augur favourably. There's no object in sending up two men if one will do.'

'That's quite right, Jerry, but your green-shutter game has been played so often, I think the old Turco is getting a bit suspicious. To begin with, you daren't put your man ashore till the signals say "All clear," and on the last occasion precious time was lost. It's such a roundabout method, and I want to get my information through to Williams at once. The fact is,' he went on rather desperately, 'Williams has not had his final instructions as to rail-cutting when the new move opens, and I want to get him into touch with Mursi el Kozack's brother on the Turkish lines of communication before the show commences.'

'Whew! I see,' said Stanley. 'That *is* a bit of a bird. What about old Said Mahmud?'

'Do you mean the old reprobate with the performing monkey who hangs about the native quarter in Cairo? The beast tried to take a bit out of my calf last time I met him.'

Stanley laughed. 'That's the lad,' he said. 'He'd take a message for us and bring back an answer too, if it were made worth his while.'

'I doubt if he'd take on the job, but it's worth trying,' replied Marsland, as he pulled a wad of telegraph-forms towards him. 'Sergeant West!'

'Sir?' replied the chief clerk as he entered the tent.

'Take down this message, please, and mark it "Priority." Are you ready?'

'Yes, sir,' was the reply.

'To Intelligence, Cairo.—Find and send Said Mahmud, monkey-tamer in Cairo, here by to-night's mail—urgent.'

'That's done,' sighed Marsland with an air of relief. 'And now, what about a spot of luncheon?'

III.

The message, arriving late that afternoon in Cairo, caused some trouble and search, for locating the proverbial needle in a bundle of hay is child's play to finding a particular native at a moment's notice in an Eastern city; but by the evening's mail there departed a brown-skinned native, provided with a pass and accompanied by a muzzled baboon, which kept a crowded third-class carriage awake and amused the greater part of the night from Cairo to Kantara, and thence up the single-track military line to Ludd, where man and beast were safely decanted on to the line at dawn next morning, to trudge slowly, in the teeth of a raging sand-storm, along the dusty white road bordered with cactus-hedges to that vast canvas city set in the plain whence their call had come.

'Well, Said Mahmud,' said Marsland, as he found the pair squatting outside his tent when he came to his office, 'you haven't been long coming. But why did you bring your monkey? I didn't send for *him*.'

'*Saadtak* [Your Excellency] knows I am a poor man, and with whom should I leave my monkey when your Excellency sends for me? Besides, I have never been so far before, and my monkey bears me company in my strangeness. Does not your Honour wish to see him perform?'

'The old idiot,' thought Marsland; 'does he really think I sent for him all this way to see his monkey's parlour-tricks?'

'*Malesh*' ('It doesn't matter'), he said aloud. 'Come along into this tent. I want to talk to you. Yes, bring the monkey too,' he added, as the man hesitated. 'Sit down there,' pointing to the soft, warm sand. 'You say you're a poor man; do you like money?'

'Your Honour knows I do. Money buys many things.'

'Well, Said Mahmud, I'm going to give you some work to do, and when you have completed it to my satisfaction, the Government will pay you much money. Do you know Damascus?'

'No, your Honour; but I have often heard talk about it, for my father's cousin, Ahmed ibn Daoud, lives there. He has a shop in the Suk el Nahas [the brass bazaar],' he added proudly.

'I'm going to send you there with a letter to an *effendi*, and when you return with the receipt, you shall have much money.'

'How much, *Saadtak?*'

'Twenty pounds.'

The man's eyes glistened, he straightened his back, and his whole bearing underwent a change; then, suddenly recollecting himself, he asked, 'But what about the Turks, your Honour? There is war between the Turks and the English, and when they see me, they will surely kill me.'

'Not so, Said Mahmud. Who will know you

carry a letter? Have you not your monkey with you, and are you not a poor man who lives by his monkey's tricks?'

'True, your Honour; but yet I fear. Nevertheless, tell me what I have to do, and I will go, for, Allah knows, it is a great reward.'

'To-night, when it is dark, we set forth from this place, and go together to the place where the soldiers keep guard, and from that point you set forth alone on your task. When you get to the Turkish lines, you have but to say you are a poor Muslim who cannot make a living amongst the accursed *Nuzrani* [Christians], and who is, therefore, making his way to his cousin in Damascus, and they will let you pass. When you get to Damascus, you shall go to one I shall name to find the English *effendi*, and so deliver your letter. Bring me then the *wasl* [receipt], and you shall have your money.'

'But how to carry the letter, *effendi*, so that they do not find it?'

'I can make a suggestion as to that,' put in Stanley, who had meantime entered the tent, and had been an interested listener to the conversation. 'If he won't be parted from his d—d monkey, why not sew the letter into the lining of its collar, and then take its muzzle off? I shouldn't think anybody would care to search the monkey, from what I know of it.'

'By George, a good egg!' replied Marsland enthusiastically, as he rapidly explained the scheme in Arabic to Said Mahmud. Then, raising his voice, he shouted for Abdul Hassan, and bade him feed and take charge of man and beast till wanted that evening.

IV.

Meantime a letter was written on thin paper and carefully stitched between the two strips of leather forming the collar, and as dusk fell the queerly assorted trio entered a car for their six-mile drive to the front line. The journey was a short one, and was enlivened by but one incident, when Said Mahmud, to save time, removed the beast's muzzle, and a deliberate attempt to bite Marsland followed.

On their arrival at the wire, final directions were given, the muzzle was again removed, and the pair set forth on the first stage of their long journey across a field of young green corn waving mystically in the dusk. Marsland lingered a short time at the outposts discussing events with the officer in charge of the sector, and then, re-entering his car, was driven back to headquarters.

Two nights later he was wakened by a rapping on the wall of the tent, and going out, discovered a little group, consisting of the officer on night-duty, and Said Mahmud in the charge of an escort from the front line, very bedraggled, knocked about, and in tears.

The officer explained that the man had been found by a patrol wandering about in No Man's Land and brought in for examination, and being recognised as the same native who had set forth two nights earlier with a monkey, had been sent straight to G.H.Q.

Marsland's laconic inquiry of '*Khabar e?*' ('What's the matter?') let loose a flood of eloquence.

'Alas, your Excellency! I am unfortunate. Two nights ago when I set forth I found my way without difficulty to the Turks, who, being Muslims, received me kindly and gave me a place to sleep, and when day broke crowded round me; whereupon, to please them, I made my monkey perform. With this, however, they were not content, but sent me from place to place, and each time my monkey had to do his tricks afresh. At length he became tired, and I as well, for we were both hungry, having eaten naught since the night before, and a Turkish officer incautiously venturing too near, my monkey, with one spring, bit him in the hand. Thereupon the *effendi* became enraged, and ordered the soldiers to kill my monkey, and without delay they beat him with the butts of their rifles till he died. To my remonstrances they replied by falling upon me, and beating me too till I was sore. Look, your Excellency!'—slipping out of his *galabieh*, he exposed his back, all raw and wheeled with blows. 'They finished by casting me forth with my dead monkey, and telling me that it was only because I was a Muslim that they did not treat me likewise. I wandered all that day and the next till the soldiers found me and brought me in,' he finished simply.

'Where is the collar?' was the eager question.

'See, your Honour, I am no fool, but a clever man, for, when they cast me forth, I understood the importance of the collar, so, leaving my monkey in the long grass, I slipped it into my pocket, and here it is, unharmed!'

'*Inte shatir auwel*' ('You are exceedingly clever'), replied Marsland approvingly. 'Lie down now and sleep till daybreak, and I will reward you;' and dismissing the escort, he turned and re-entered his tent.

V.

Dawn broke in a pearl-gray sky, rose-tinted with the coming sun, and Marsland's 'boy,' entering his tent with the morning cup of tea, found his master wide awake, and revolving, with the aid of a cigarette, his problem this way and that, seeking a solution, for time was scarcely less important than secrecy.

Many ways offered—and yet others might be evolved by a cunning brain—for getting a message through, such as, for example, dropping messengers from aeroplanes; but they were all marred by the one defect of publicity, for in that far land, where time is as naught compared with gossip, curiosity, and the pertinacious in-

vestigation of your neighbour's business, a means had to be sought, both sure and speedy, of getting communication through without arousing the least vestige of suspicion. These bare, sandy wastes and stony outcrops are to all appearance tenantless, but the noise of an aeroplane is heard and understood there by wandering Bedouins, and the descending airman as quickly and efficiently plundered as in more civilised regions—a fact of which Marsland, walking to his office after a hasty breakfast, was only too sadly conscious.

'Heard the news, Jerry?' he rasped at Stanley as they met. 'Said Mahmud done in, and three clear days wasted!' In response to Stanley's tactful inquiry, Marsland poured out his tale of woe. 'I'll have to go myself,' he finished dolefully.

'Don't be an ass, Marsland. You couldn't be spared now, of all times; and, besides, you've got a sheet-anchor in Abdul Hassan, whom you can always fall back upon as a last resource.'

'Yes, I know, Jerry; but if the Turco got to windward of old Said Mahmud, it isn't likely Abdul Hassan would get through, if he went.'

'Abdul's a man of infinite resource,' retorted Stanley, 'or at least you always say so, and he'd have his wits about him more than Said Mahmud, whose head was probably full of his monkey half the time. He'd go, of course?' he queried.

'Abdul would go to the world's end with me, or for me,' replied Marsland; 'but I can't see how to hide the message. He couldn't possibly commit it to memory,' he concluded decisively.

'What about "Morse"?' inquired Jerry. 'Williams know it?'

'Of course he does,' was the caustic retort; 'but you don't suppose we can "Morse" a message hundreds of miles without being seen, do you?'

'If you had your temper under better control, Marsland, you might find it an advantage.'

'Sorry, old chap, if I hurt your feelings; but what's the game?'

'First of all, send for Abdul. Tell him to be ready to move off at dusk, and make him give you his *arbaya*.'

'I won't have anything sewn up in the *arbaya;* it's certain death to the man, and there's nowhere to hide it,' snarled Marsland.

'All right, old son, do it your own way,' said Jerry equably.

'Tell me what you propose,' was the ungracious reply.

'Let's have Abdul in.'

'*Esma, ya Abdul*' ('Listen, O Abdul!'), said Marsland as the chief agent came in. 'I am going to send you to Damascus with the letter Said Mahmud has failed to deliver. You go to-night.'

Not a muscle of the man's face moved. '*Taib, effendi,*' he replied simply. '*Taht el amr*' ('I am under your orders').

'Be here at seven o'clock. And now go and sleep; but first give me your *arbaya*.'

Withdrawing for a moment to slip the gown over his head—for no native removes his tarboosh in a white man's presence, unless as a gross affront—Abdul handed over the *arbaya* and departed.

'And now, Jerry?' inquired Marsland, interested.

'Now we'll write your message, and then boil it down to the smallest possible dimensions;' and the two heads, the iron-gray and the brown, bent side by side. They wrote, altered, redrafted, and excised till at the end of twenty minutes it was clear the message could not be further compressed.

'Now I'm going to turn it into "Morse,"' remarked Jerry cheerfully.

'All right,' was the resigned reply.

'Meantime,' continued Stanley remorselessly, 'you can hop over to the tailor's shop and get a man to come along with a needle and some green thread.'

By the time the message had been encoded, Marsland reappeared with a craftsman from the tailor's shop.

'Look here, my lad,' said Jerry briskly; 'do you see these marks on this paper—d'ye think you could embroider them on a native gown?'

'Yes, sir,' said the corporal, rather mystified; 'but it'll take time—say three to four hours at least.'

'Never mind. Sit down here in this tent, rip all the embroidery off the front of that *arbaya*, copy these marks on to it, and then sew the embroidery on again.'

The job proved more troublesome than anticipated; but when Abdul Hassan reported for instructions that evening, he was simply told to make his way to Damascus, a city whose intricacies he knew of old, and to report himself to Williams Bey there, whose whereabouts were disclosed to him, and hand him his *arbaya*, with the instructions from Marsland Bey to rip off the embroidery.

. . . . . .

Upon the intricacies, the difficulties, and the dangers of that journey of Abdul Hassan across the Plain of Esdraelon, leaving the bold outline of Mount Carmel at Haifa on his left and Nablus on his right, sheer across the enemy's lines till he sighted Damascus, there is no need to enlarge. Suffice it to say, none but a man whose playmate was danger, and whose bedfellow death, could have brought it to a triumphant conclusion. Nor could one less skilled than Williams in unravelling problems correctly have interpreted the cryptic message so ingeniously sent him; but that it reached its consignee was clearly evident some weeks later when the enemy's railway-lines, Tom Bowling like, went aloft, and communication in several sectors was irretrievably broken.

THE MONTH: SCIENCE AND ARTS.

A NEW ALLOY FOR CUTTING-TOOLS.

WE have been accustomed for so long to associate steel with all kinds of cutting-tools that a new metal, having no iron in its composition, for which better results are claimed than are possible from steel tools, comes almost as a shock. Cooperite, as the new cutting alloy is called, has been invented by the Cooper Research Company, of Cleveland, Ohio. It is composed of nickel, tungsten, silicon, molybdenum, aluminium, and zirconium. Unlike steel tools, those made of Cooperite are not forged or hardened, but are cast in the form desired and ground to a cutting edge. When tried in a lathe with a very heavy cut, a Cooperite tool lasted for 14 minutes 39 seconds, and was then in fairly good condition; whereas a tool made of high-speed steel was worn out after 2¾ minutes at the same work. During another similar test, a Cooperite tool lasted for 21 minutes 20 seconds, against only 2 minutes 20 seconds for one made of high-speed steel. Cooperite is said to be suitable for all but very thin tools. Arrangements are being made to produce the alloy in this country.

NOVEL HIGH-SPEED BOATS.

During the war some remarkable craft, driven by air-propellers, were developed in France, and they have since been standardised and adopted by the French Colonial Service. The hulls of these boats are in the form of a rectangular, shallow, flat-bottomed box, which is sheathed with thin sheets of duralumin (a very light and strong alloy of aluminium). The front, or bow, of the boat is curved upwards to an edge at the top, and the hull is divided into five or more water-tight compartments. Three or more steps are arranged along the bottom, the effect of which is to cause the boat to rise almost out of the water at high speeds and skim along the top. The standard type of 'hydro-glider,' as this kind of craft is designated, measures 24 feet by nearly 10 feet, and it will just float in nine inches of water when at rest or proceeding at a slow speed. At forty or fifty miles an hour the boat skims along near the top of the water, and requires a depth of only 3 inches. The propelling-power consists of a petrol motor, capable of developing 230 h.p., which drives a 9 feet 10 inches propeller through chains. The boats may either be open or fitted with cabins. With the open type, carrying three persons and petrol for sixty miles, a speed of fifty miles per hour is guaranteed. The engine, however, is throttled down after the boat is skimming, 150 h.p. being enough to maintain this speed. Hydro-gliders are used for carrying goods as well as passengers, and each is capable of transporting a load of two tons. For the shallow, weedy rivers to be found in many parts of the world these craft are invaluable, especially in cases where high speeds are a desideratum. Recently a hydro-glider made a trip of seven hundred miles on the Mekong River in French Cochin China. During this trip water only five inches deep was passed over, and immediately the boat was stopped it rested on the mud, but no difficulty was experienced in starting again. In some cases the boat was run over only three inches of water, and grounded when stopped. With this shallow depth, however, it was found necessary to push the vessel into deeper water before it could be moved with the propeller.

A FEATHER-WEIGHT DYNAMO FOR BICYCLE-LIGHTING.

Every cyclist admits the advantages of electricity for head and rear lights. It is both cleaner and more convenient than oil or acetylene, the only drawback being the weight of the apparatus involved—the accumulator or the dynamo, according to the immediate source of the current adopted. Dynamos driven from the rim or the tire of one of the wheels have been used for several years, but until recently their weight has been considerable. A new model has been brought out recently, however, the dynamo of which weighs only 7½ ounces. This dynamo resembles a small bottle in appearance, the spindle projecting through the 'mouth,' and terminating in a small rubber wheel. This wheel is pressed against the outer edge of the rim or the side of the tire, the resulting friction driving it at a high speed. Both front and rear lamps are supplied with current through insulated wires, which are attached to the frame by special clips included in the outfit. The lights are turned on or off by a switch that brings the wheel on the dynamo into contact with the rim or the tire, or causes it to stand clear, as may be desired. This switch, it may be noted, can be worked while the machine is being ridden. The appliance is clipped to the back-fork on the left-hand side, and the complete outfit can be fixed on a bicycle in a few minutes.

AN ELECTRIC CABLE FOR GUIDING SHIPS.

No condition of the weather inspires greater fear at sea than fog does, and this in spite of directional wireless apparatus, sound-signals, and other aids for ascertaining the position of a vessel when no lights or landmarks can be seen. An electrical device for overcoming the fog danger, known as the leader cable system, was invented during the war, and was used to great advantage by the British Navy. An electric cable is laid along the bottom of the sea, leading

into ports or through any specially narrow or difficult channels. An alternating current of electricity is passed through this cable from the shore. The apparatus on the ship consists of two coils of wire, one on each side, these coils being connected to telephones on the bridge. When the vessel is within three hundred yards of either side of the cable, a clear, musical note is heard in the telephone. By means of a key at the shore end, the current can be broken up into the dots and dashes of the Morse code, the signals being strengthened by instruments in the telephone circuits known as amplifiers. On approaching a harbour in foggy weather, those in charge of a vessel endeavour to strike the track of the cable. When a note from the latter is heard, its comparative loudness in the port and starboard telephones indicates on which side of the vessel the cable is located and its approximate distance away. It can then be followed until the ship is in port or has navigated the channel through which the cable leads. A demonstration was recently given at Portsmouth, where a leader cable is laid, to a party of foreign naval attachés, who were present at the invitation of the Admiralty. The system is also in use for the Ambrose Channel leading to New York harbour.

HUGE MOTOR-OMNIBUSES FOR LONDON.

Londoners have long been familiar with what is known as the K type of omnibus, which is capable of carrying forty-six passengers, against only thirty-four carried by omnibuses of older design. A later type, known as the S, has now been placed on the streets. This vehicle carries fifty-four passengers, and is fitted with a motor of 35 horse-power, which drives the propeller-shaft through a new type of clutch at 940 revolutions per minute, when the omnibus is proceeding at twelve miles per hour. Owing to the effectiveness of the radiator, only six gallons of water are needed for cooling the cylinders, against ten gallons in the original form of motor-omnibus. The pistons are of aluminium, and the gear ratio is $9\frac{1}{3}$ to 1; but against this feature must be set the larger road-wheels. The dynamo for lighting the omnibus is driven from the engine, and is larger than in the K type, as three extra lights are provided. The body is built mainly of three-ply wood, and improvements have been made in the means for ventilation. The cost of the new omnibus is estimated at £2150.

A NEW MOTOR-SPIRIT MIXTURE FOR CARS.

Efforts are constantly being made to produce a motor-spirit for cars which, while giving as good results as petrol, may be purchased at a lower price. In this connection some interesting experiments have been carried out recently at the Bristol University by Mr L. S. Palmer, M.Sc., who has laid the results before the Institution of Automobile Engineers. He found that if 15 per cent. of naphthalene was dissolved in commercial benzol, the mileage per gallon was increased by 3·4 per cent. over that obtained with benzol only. With naphthalene at £7 per ton, the price of an efficient fuel is thus reduced from 2s. 9d. to 2s. 6d. per gallon; and with the increased mileage the saving per 100 miles is estimated at 8d.

CARBONIC ACID GAS AS A FERTILISER.

Every plant contains a large proportion of carbon in its composition, and this element is now generally admitted to be derived from the atmosphere by means of the leaves, in spite of the very small proportion of carbon, ·03 per cent., to be found in fresh air. It is only reasonable to suppose, therefore, that by increasing the percentage of carbonic acid gas, known by chemists as CO_2, in the air around growing plants, their growth will be accelerated. But in order to make such a method commercially successful, a cheap and abundant source of carbonic acid gas must be found. As is well known, the gases escaping from all fires contain this gas; but a particularly large proportion distinguishes those discharged from blast-furnaces. Founding on this fact, Dr Riedel, of Essen-on-Ruhr, has patented a process whereby growing plants are supplied with blast-furnace gases after they have been purified from their noxious constituents, such as sulphur. In order to test the process, a greenhouse was supplied with the purified gases by a number of pipes, these being run backwards and forwards over the whole length of the room, and punctured at intervals for the escape of the gas. Two other greenhouses, without any gas-supply, were tested at the same time to obtain comparative results. Experiments were begun about the middle of June. The effect of the gas upon a castor-oil plant was to produce leaves more than a metre in width, whereas in the two other greenhouses the leaves reached only about half that size. Tomatoes increased in weight by 175 per cent., cucumbers by 70 per cent. Open-air experiments were also tried in suitable plots of land, around one of which was a pipe with holes at intervals, through which the carbonic acid gas was continually escaping. CO_2, being heavy, would, of course, lie along the surface of the ground. In the open air the yield of spinach was found to be greater by 150 per cent. in the gas-supplied plot, while potatoes increased by 180 per cent., lupines by 174 per cent., and barley by 100 per cent. Later tests on a much larger scale have shown an increase in a potato-crop of 300 per cent. According to the inventor's opinion, as set forth in the *Scientific American*, carbonic acid gas works for supplying agriculture will before long be quite as common a feature as electricity and gas works, the large industrial centres at the same time becoming centres of increasing agricultural production. Careful

analysis has shown that no danger to the health of man is threatened by the additional amount of carbonic acid gas contained in the air where this system is in vogue.

A GLOBE UNBREAKABLE BY HEAT.

We presume that few users of the incandescent gaslight have not been annoyed at some time or other by the breaking of a globe through its becoming overheated. A new kind of globe has recently been put on the market, however, which will entirely obviate this annoyance. It is made of a substance to which the name 'Vitreosil' has been given, and which is composed of pure silica fused in the electric furnace by a special process. A test carried out lately in our presence gave ample proof that a globe made of this material was quite unbreakable by heat. The globe, after being dipped in cold water, was placed, without being dried, on the top of a lighted Bunsen burner, and allowed to remain there until it became white-hot. It was then lifted off, and though dropped instantly into a pail of cold water, was found upon careful examination to be entirely unharmed. Its durability, however, is not the only good feature of this new globe. Owing to the nature of the material, the light passing through it is soft and pleasing to the eye, all trace of glare being removed. The lighting-power of the gas is also enhanced, for the globe fits so close to the incandescent mantle that the temperature of the latter is increased, thus causing it to give off more light. Even a slight increase of temperature, it may be observed, produces a considerable augmentation of illuminating-power, for the heat and light given off at different temperatures are not in simple ratio, but vary approximately as their cubes. In addition to these advantages, a damaged mantle may still be used without danger to the globe, a thing utterly impossible with the ordinary kind of globe. Silica, it may be noted, has long been employed in the manufacture of crucibles, tubes, basins, &c., for use in chemical laboratories, as it resists the action of ordinary acids, and does not crack when it is suddenly heated or cooled. Its utilisation for globes or lamp-shades, however, and for the large hemispherical bowls, hitherto commonly made of glass or alabaster, which are employed in the semi-indirect method of gas-lighting, opens up a much wider sphere of usefulness for this important constituent of the earth's crust.

A NOVEL HAT AND COAT PEG.

A new form of hat and coat peg which has recently been invented appears likely to find a distinct niche for itself. The back part forms a small bracket which is fixed to a door or a wall in the ordinary way by means of three small screws. Attached to the lower part of the bracket is the peg proper, which works on a spring, so that when it is not in use it lies flush with the wall or the door. When required for service, the peg can be instantly pulled down into position, and the weight of the coat or hat placed on it is quite sufficient to keep it there. When the garment is removed, the peg again springs back, so that it is once more flush with the wall. This device should prove especially valuable where space is an important consideration, as in narrow passages, in 'hanging' cupboards, on board ship, or in a motor-car or a railway train. When provided at the back of a seat in a church or other place of public resort, or on a table-leg in a restaurant, it completely solves the problem of the disposal of the hat. Fastened to a door which swings back against a wall, it will save the wall from the danger which constantly threatens it from the ordinary form of peg. It is obtainable in plain or polished brass, steel bronze, oxidised copper, or in the familiar nickel-plated form.

WHO'S WHO IN AMERICA.

Like its British confrère, this valuable reference-book, which is published biennially, is 'swellin' wisibly.' The first edition (for 1899-1900) contained 827 pages and 8602 'potted' biographies; the present edition, the eleventh (for 1920–1921), contains 3302 pages and 23,443 biographies, of which 2514 appear for the first time. Even a brief examination shows that it has succeeded in its aim of giving crisp, personal sketches of the most notable Americans in all parts of the world—the men and women whose achievements or whose official positions render them of interest to 'the man in the street' or 'the woman at home.' References are also given showing in which of the previous issues particulars may be found of noteworthy people who have died or retired recently. A feature of the work which will make a special appeal to local patriots is the section called the Geographical Index, which groups, both by States and by the townships within them, all the persons dealt with in the body of the book, thus making it easy to find the biographies of those connected with any particular locality. The book is published in this country by Messrs Stanley Paul & Co., 31 Essex Street, Strand, W.C.2, at 45s. net.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (*a*) a reply post-card, or (*b*) a stamped and addressed envelope or post-card, be sent to the Editor, 339 High Street, Edinburgh.

*** TO CONTRIBUTORS.

1*st*. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Printed and Published by W. & R. CHAMBERS, LIMITED, LONDON AND EDINBURGH.

THE MYSTERY OF THE *WELL MET.*

By E. R. PUNSHON, Author of *The Woman's Footprint, Old Fighting Days,* &c.

CHAPTER I.—ADRIFT.

WHEN for the second time the sun rose and showed to Hervey Drake nothing but the same desolate and wide expanse of unbroken sea and sky, hope left him.

Two days before he had been the first mate of the *Bramley Cottage* of the Cottage Line, on a voyage from San Francisco to Auckland with a general cargo. The trip had been uneventful and prosperous until the morning when one of the hands came to him with a slightly scared look to say that there seemed to be a smell of burning coming from No. 2 hold. Drake reported the matter at once to the captain, who treated it as of small importance, and, somewhat rashly, ordered the hatch to be removed, when, with the admittance of the current of fresh air, a great smouldering mass of cargo amidships burst into a perfect volcano of raging fire that swiftly wrapped the ship from bow to stern, spreading with an inconceivable rapidity.

The catastrophe was as overwhelming as it was sudden. Of the three boats they had, one was leaky and of no use, one was launched successfully, and the third, that of which Hervey was in charge, capsized as it was being lowered, one of the falls unfortunately breaking. Hervey himself and one other man of those thus precipitated into the sea succeeded in regaining the boat and clambering upon her as she floated upside-down. With infinite labour they managed finally to right her, but not until the burning ship and the other boat, which did not seem aware of their misfortune, were nearly out of sight.

Darkness fell soon, and when morning came Hervey and his companion were alone on the wide bosom of the sea, without food or water, without oars or sails, everything with which the boat had been fitted having been lost when she capsized. All day they drifted thus. During the night the other, a Scandinavian ordinary seaman, went mad and jumped overboard—and Hervey envied him the swift and easy way of escape that he had found.

For he had little hope or none. How small was the chance of so infinitesimal an object as a drifting boat being discerned on the trackless desert of the sea Hervey knew well. Even if a ship did pass, it was not likely he would be seen. That land was not far away he knew well enough, because all that part of the Pacific is studded with islands, known and unknown, inhabited and uninhabited; but without sails or oars he had no chance of being able to reach shore, even if he had been aware of the best direction in which to steer—or, for that matter, had had the means of steering, for the boat's rudder had been broken. To some extent, indeed, he remedied this by improvising a kind of rudder from a thwart, and with the aid of another thwart and his shirt he rigged up something that he tried to pretend was a sail, but that, in fact, was hardly enough to give the boat steerage-way.

All he could do was to try to keep her head west, and to wait the almost inevitable end. Fortunately the weather remained fine and calm, and his shirt, if not a great success as a sail, did at any rate relieve a little the boat's extreme inconspicuousness. A ship passing near might now perceive that pathetic patch of dingy white against the horizon, and might possibly alter course to investigate it. Towards noon he was almost sure he could see land on the port bow. But he had no means of reaching it, and indeed it might have been a mirage or a mere illusion, for once or twice already he had found himself growing light-headed.

'Might as well follow Jansen's example and jump overboard and end it,' he said to himself; but the instinct of his race to fight even a losing battle to the end was strong upon him, and presently towards three o'clock in the afternoon he fell asleep.

He dreamed that he was back at home, and that his mother, grumbling at him for being late for dinner again, was taking out of the oven an endless succession of savoury and steaming dishes, to which he was just about to help himself, when he awoke, with a kind of gurgling cry, to the realisation of the truth.

But the hoarse, choking croak he had uttered as he awoke he repeated again, for, as he looked round upon the merciless sea, the unpitying sky, he saw suddenly, not very far away, and coming fast towards him, a small schooner, following as

 [*All Rights Reserved.*]

directly on his course as a hound follows the trail of its quarry.

Incredulous, he fell upon his knees in the bottom of the boat, and for fully a minute he hid his face in his hands. He was, one supposes, as brave and firm of soul as a man, as a sailor, need be, but it is the literal truth that he kept his face hidden thus because he dared not look again lest what he had seen had been a fantasy of his overwrought brain.

He possessed, too, besides a sailor's bravery, a sailor's simple piety, and while he kept his face hidden in his hands he prayed earnestly, commending his soul to God, and having, indeed, the full expectation of standing soon in his Maker's presence. But when at last, his mind more tranquil now, and braced to meet what might betide, he lifted his head and looked, the schooner was still there, palpable, evident, and much nearer than before.

Her course was laid directly for the drifting boat, but he could see no one on board her, and now a new fear assailed him, lest all the crew should be asleep or occupied in some way, and so pass him unobserved.

He noticed, too, that though the little schooner was a smart, trim vessel, evidently in good repair, showing plenty of fresh paint, and appearing well-found in every respect, yet there hung about her certain odd indications of neglect and carelessness that went strangely with her generally smart and trim appearance. These indications were very slight and trivial, merely a sheet hanging loose, an untidily stowed tackle, an awning put up aft in a very clumsy style, and so on. Only a sailor's eye would have noticed them, but they puzzled Hervey a good deal, even now in the moment of his reborn hope.

'Ahoy! Ship ahoy!' he shouted, long before there was any possibility of his thin and exhausted voice reaching the still distant schooner. 'Ahoy, ahoy!' he shouted again, and though even yet he could not have been heard, he could make out that he had been seen, for he saw forms moving quickly on the schooner's deck.

Eagerly he watched, and soon he saw that the schooner was beginning to shorten sail—saw, too, that this was being done very clumsily and unhandily.

With increasing wonder and impatience he watched a whole series of awkward manœuvres which really seemed to suggest that the crew of the schooner knew so little how to handle her that they were not even sure how to get him on board. In the end they as nearly as possible settled the matter by running him down, but he managed somehow to push his boat from under the schooner's bow, and then, as he scraped alongside, one of the men on board dropped him a rope, which he at once seized. A moment later he was on deck, where he promptly fainted. . . .

When Hervey Drake came to, he was lying on a pile of rugs under the awning he had noticed aft, and sitting on a deck-chair near by was a tall, thin man dressed in an ill-fitting suit of white flannels that seemed to have been made for a somewhat shorter and much stouter man. The face of this stranger looked to Hervey as little prepossessing as any he had ever seen. The eyes and the cheeks were hollow and sunken, the mouth thin-lipped and scowling, the general expression at once fierce and furtive, and an ugly scar on the left temple added nothing to his attractiveness. His whole manner was, indeed, so malignant and repulsive that instinctively, as he watched him, Hervey felt just such a chill shudder of abhorrence crawl down his spine as some people experience on seeing a snake or a toad.

'Feeling better?' this individual asked, his tone quite friendly, and with a smile that had the very curious and daunting effect of making his expression appear even more evil and malignant than before.

And that is indeed a bad man whose smile does not show at any rate some touch of kindly, human feeling.

'Yes, thank you,' Hervey muttered as well as he could, for his lips and tongue were still black and swollen, though they seemed to have been bathed with cold water. 'What ship's this?'

'The schooner *Well Met*,' answered the other, 'bound from Suva to Manilla.'

'The *Well Met*, indeed!' murmured Hervey, struck by the coincidence of the name. 'Are you the captain?'

The stranger shook his head.

Hervey, too weak to continue the conversation, closed his eyes, but opened them again at once as a delicious smell reached his nostrils.

Coming along the deck towards him was another man, smaller in build than the other, and wearing ill-fitting white flannels that had evidently been made for a bigger and stouter man. In looks he was nearly as ill-favoured as his shipmate, his small, greenish-hued eyes, flat, short nose, low receding forehead, and huge protruding jaw giving him a strangely animal appearance. His manner, too, had the same fierce and furtive air, and his cheeks also were worn and hollow, so that it seemed as though they had both recently experienced many hardships.

But of his unprepossessing appearance Hervey took no heed, for he bore in his hands a basin of steaming soup, and no living being carrying such a burden would have failed at that moment to find favour in Hervey's sight.

Eagerly the rescued man held out both his hands with a gesture that was pitiful enough, so much did it tell of what he had gone through. But he was still too weak to feed himself, and when they realised this, the evil-looking, tall, thin man knelt down by his side and began to feed him with a spoon.

'Thank you,' Hervey muttered between the spoonfuls. 'I 'll remember; handsome is as handsome does.'

'What 's he say?' asked the second man, with an oath.

'I don't know. Off his head, very likely,' his companion answered indifferently; and when he had given Hervey all the soup there was, he picked up a rug and flung it over him, telling him he had better sleep now.

CHAPTER II.—ON BOARD THE *WELL MET.*

IT was good advice, and not difficult to follow, and Hervey fell almost at once into a profound slumber, from which, some hours later, he wakened with a start, unable at first to remember where he was, or what had happened, or why he felt so weak and ill.

He was lying in a bunk, he saw, but not in the one in his familiar cabin on board the *Bramley Cottage*, which puzzled him enormously for a time, till he remembered the catastrophe and his own rescue.

Sitting up, he looked around. It was evidently night, for the only light came from a smoky lamp swinging overhead, and as evidently the place in which he now found himself was the forecastle of a small ship. Moreover, it was a forecastle that either had been until recently, or was now, in the occupation of Kanakas.

That much was proved by various little articles of native use or adornment that were lying about, and Hervey's first sensation was one of great indignation against this breach of the etiquette of the sea that had put him, a white man and a ship's officer, in with native seamen. It was an insult almost enough to wipe out the memory of his rescue. While he was still hot with indignation two men came in and seated themselves at the narrow table that ran down the middle of the forecastle. They had a bottle with them and glasses, and seemed in so great a hurry to help themselves to the liquor that they never gave even a single glance in Hervey's direction.

They were both white men, and were nearly as unprepossessing in appearance as the two he had already seen. They were both low-browed, scowling rascals, with the odd air he had noticed in the other two of furtive, slinking fierceness, like that of a half-tamed wolf which is eager to snap and bite, but is restrained by fear of swift punishment. They resembled the others, also, in having the same worn appearance, hollow eyes, and sunken cheeks of men who have known many hardships, and in being dressed, not in ordinary rough sailor costume, but in linen suits that fitted them very badly, and that had apparently belonged to a much bigger man.

The smoky lamp, flaring overhead, threw its uncertain and flickering light on these sinister-looking companions as, with their heads close together, they drank and muttered in each other's ears. Hervey, leaning back in his bunk—for he was still very weak—thought to himself that he had been taken on board a ship that carried a strange crew. Yet they had saved his life, and, of course, the insult of putting him in the forecastle with the Kanakas lost much of its poignancy if the white members of the crew shared the same quarters. Yet that they should do so seemed to the mate very strange; and another odd thing that struck him, as trifles will at times, was that the smoky lamp overhead had a brass holder, and was of a quality not often supplied to forecastles. He thought it would have seemed more in place in the captain's cabin.

The two men drinking together had so far never once looked in his direction or seemed in any way aware of his presence. They were muttering away in a very eager and absorbed manner, and the few words that Hervey caught now and again were in French, a language of which he had little knowledge. Sitting up in his bunk, he called out to them, 'What time is it?'

They sprang up together, and one of them whipped out a great knife with a very threatening gesture; but the other cursed him angrily, and told him to put it up again, which he did, sulkily enough.

'Time, m'sieur?' said this second man, turning to Hervey and speaking good enough English, though with a strong foreign accent. 'It is nearly midnight. How do you find yourself?'

'A bit shaky still,' answered Hervey. 'That chap seems rather handy with his knife, doesn't he?' he added, surveying the individual in question with considerable disfavour.

'Ah, monsieur must pardon him,' answered the other. 'It is his nerves. The poor Jacques suffers from his nerves, and your question startled him. But it is nothing. He has the good heart, and in reality he would not harm a fly.—Jacques, step on deck, like a good creature, and tell the captain that monsieur is awake.'

As Jacques, with a final scowl, and still fingering the handle of his knife, slunk—there is no other word to describe his manner of progress—out of the forecastle, Hervey, looking after him, remarked, 'That chap would suffer from something else besides his nerves if I had much to do with him.'

'He is a good soul,' answered Jacques's friend. 'I assure you, at bottom, one of the best of men, and with a heart—oh, without doubt, a heart of gold.'

'Glad to hear it,' said Hervey, realising that he was not exactly in a position to be too critical. 'Your watch below, is it?'

'Without doubt.'

'Your first voyage?' Hervey persisted.

The other shot at him a glance so sinister and threatening that it was worthy of the golden-hearted Jacques himself. 'What causes m'sieur to think that?' he asked.

'A good many things,' answered Hervey; 'for one, when I asked you the time you said it was nearly midnight. A sailorman usually talks of four bells or eight bells, not of hours.'

'M'sieur is observant,' said the other, 'and he is truly correct. This is my first voyage, and I hope also that it will be my last. I ask myself,' he added, 'what other things m'sieur has noticed.'

'A good many,' answered Hervey, swinging his legs out of the bunk and sitting on its edge. 'That, for instance,' he added, pointing to a very large and dark stain in the middle of the forecastle floor. 'What did that?'

'That?' said the Frenchman, looking at it—and he laughed; nor was his laughter good to hear. 'Oh, that is coffee. The good Jacques spilt it, clumsy fellow that he is, and, as you see, it will not come out.'

'Must have been a stronger brew than most sailormen get,' observed Hervey, and as he spoke the good Jacques came slinking back again, followed by the tall, thin man, in ill-fitting flannels, whom Hervey had seen first of this ill-favoured crew.

'Ah, you are awake,' he said as he entered, his voice brisk and cheery, his strange and daunting smile accentuating the cold malignity of his eyes. 'How are you feeling? Better, I hope, but ready for something to eat, very likely. Tommy Drew is our cook, and he will be along in a minute or two with a feed for you. Food and rest are what you want, I guess; aren't they?'

'It's very good of you, I'm sure,' said Hervey hesitatingly, divided between his instinctive shuddering disgust of this man and gratitude for what seemed his genuine kindness.

'That's all right,' said the other heartily. 'Any one is always glad to do what he can for a shipwrecked sailor. I suppose you have been wrecked. By the way, you haven't told us yet how you came to be in such a fix, you know. I reckon you're a sailor, though. An officer?'

Hervey nodded, and noticed that his questioner looked suddenly relieved, and that the golden-hearted Jacques, who in the background had been fingering his knife again and feeling its edge with his thumb, slipped it back into its sheath, for all the world as though understanding that now it would not be needed.

Like lightning the idea flashed through Hervey's mind, 'What would have happened if I had not been an officer?'

The tall, thin man was speaking again. 'You understand navigation, I suppose?' he asked.

'I hold my master's ticket,' Hervey answered.

'Good for you,' said the other heartily. 'It was a stroke of good luck for you that we happened to find you, and perhaps it is going to prove as lucky for us. The fact is, we are in a good deal of a hole, and you may be able to help us out. But I had better explain. My name is Wilson—John Henry Wilson, of 'Frisco. I have business interests in Manilla, and I am on my way there on board this boat as a passenger. A week ago our captain was taken ill and died. The mate fell ill and died next day, and several of the crew the same night.'

'Good heavens!' exclaimed Hervey, greatly startled; 'what was it?'

'Cholera,' answered Wilson. 'The Kanaka crew bolted. They seized our boat and went off, most likely to some island they knew of. There were left on board only myself; Mr Drew, who is in reality in charge of the cargo and has an interest in the schooner; and these two worthy fellows, Jacques Dubois and Sylvestre Lazin, the only white members of the crew, and unluckily neither of them is a navigator or even an experienced sailor. You see our position, Mr——?'

'Drake,' said Hervey. 'Hervey Drake.'

'Thank you. Well, you see how we are fixed, Mr Drake. Our joint knowledge of seamanship and navigation is exceedingly small, and had we not had the good fortune to meet you, I doubt if we should ever have found our way to Manilla. We shall have to depend on you to take us there. You can do that?'

'That will be easy enough,' answered Hervey. 'We shall be a bit short-handed, but if the weather holds, that won't matter much. Five men ought to be able to handle a boat this size.'

They all looked a good deal relieved at this, and in the background the golden-hearted Jacques actually smiled and took his hand from his knife, as though finally convinced there would be no immediate need to use it. No one spoke for a moment, and in the silence Hervey distinctly heard a low and soft voice speak on deck, the gentle tones of a woman.

'Good Lord!' he exclaimed; 'have you a woman on board?'

'A woman? No!' exclaimed Wilson, looking extremely surprised. 'What an idea! What put that into your head? Our situation is bad enough without that.'

'I thought I heard a woman speaking,' Hervey answered.

'Ah, you have been through a lot,' said Wilson sympathetically. 'No wonder you imagine things—no wonder at all—or see them, either.—Jacques,' he added, turning to that worthy, 'go and tell Mr Drew to hurry up. Our poor friend here is nearly starving, and light-headed for lack of food—oh, and'—— and he added a word in French which Hervey could not understand, but to which the good-hearted one responded with an understanding nod as he slunk away.

(Continued on page 293.)

THE LAST OF THE SCHOOLMEN.

By Aylmer Cecil Strong.

I.

IN what to us, enlightened by our super-wars, are known as the Dark Ages, logic assumed the somewhat misleading title of 'Handmaid of Theology.' The metaphor is perilous, for ever so many of the questions so hotly disputed by mediæval doctors, bishops, Dominicans, and Franciscans are not in the least concerned with the grounds upon which dogma rests, but with purely metaphysical problems. In many of the earlier 'disputations' signs can be discerned of the birth of a critical spirit, intent on resolving the highest perplexities of the time. But the germ never fructified in the Schoolmen's keeping, for it was the belief of these that the groundwork of philosophy was interpretation, and nothing else. Holding that the supreme instrument for gaining certainty was the formal syllogism, they turned for further light to a Greek philosopher, whose teaching they could only partly grasp, while he required to be studied as a whole. Speculation then seemed to the more cautious to be running riot, and it was with a view to preventing damage being done to the Creed itself that Peter Lombard—who died Archbishop of Paris *c.* 1160—framed his celebrated *Sententiæ*. He collected passages from the Fathers bearing on the chief topics of dispute, arranging his four books so as to contain a number of questions, some of which he does not pretend to resolve. The subjects treated of are the Creation, Angels and Men, Free Will and Grace, the Sacraments, Heaven and Hell, and many more. This treatise was almost at once adopted by all the schools as the one universally recognised theological text-book of the mediæval universities, and so it remained for four centuries. After its publication, however, a well-marked cleavage set in in the Schoolmen's ranks. Those who grouped themselves round the mighty figure of Thomas Aquinas, who died in 1274, seemed likely to form conclusions which might themselves have crystallised into inconvenient dogmas, till the threatened dictatorship of the great Dominican was met by the opposition of the modest Franciscan known in the schools as Duns Scotus, the Subtle Doctor. Henceforth, till the rise of William Ockham, theologians were ranged in one or other of the two camps of Thomists or Scotists. Both these schools, it must be remembered, were at one in all matters affecting the fundamentals of faith; both, too, professed the same practical object—the reconciliation of dogma with metaphysics. But the Scotists were above all things critical, and refused to accept dogmas on the ground that their authenticity had been proved; they accepted these dogmas as being simply the command of God. Thomas Aquinas, on the other hand, firmly held that creation out of nothing, the immortality of the soul, and many another basic dogma were capable of proof. The intellect, he held, in opposition to his critics, was superior to the will. The Scotists stressed the love, as opposed to the knowledge, of God.

II.

This brief summary of the main tendencies of the highest mediæval thought has been ventured in the belief that it may help a modern reader to understand the ideas and experiences of the last of the great Schoolmen. We mean John Major, whom the late Dr Law has termed, in his collected *Essays and Reviews*, the single genuine Schoolman Scotland can boast. John Major was undoubtedly a man of profound erudition of the pre-Renaissance kind, outstanding as a theologian, an antiquarian, a casuist, and a historian. It is fortunate for his repute that he has found such devoted interpreters as the authority just cited, to whose testimony must be added that of Mr Archibald Constable, the scholarly translator of Major's *Greater Britain*, and Mr Æneas Mackay. For the *Encyclopædia Britannica* gives him short shrift, and would have us believe that were it not for the fact that John Knox and George Buchanan delved deeply in his writings, these would possess little interest or importance at the present day. We feel confident, however, that even if his works on logic and the commentary on Aristotle's ethics, which he dedicated to Cardinal Wolsey, have lost their savour in this year of grace, his *Greater Britain*, which gives us not merely the chronicles of his own country, but a vast amount of information regarding the England of his day, is still quite entitled to stand on its own merits. And one may feel assured that the last title to fame the safe and moderate author of the shrewd commentary on Peter the Lombard's *Sentences* would have desired would be that of a 'forerunner of the Reformation.' Orthodox and conservative in matters of religion he is to the core, yet withal an eclectic, adhering to neither of the afore-mentioned schools. Editor of a work of an opponent of Scotus, he often cites the words of the Subtle Doctor to approve of them. This independence is, within its well-defined limits, a very strong note in his personality.

One or two of the points of casuistry discussed by Major in all sincerity and reverence may be of interest as throwing light not only on certain aspects of his own mentality, but on the Schoolmen's way of thought in general. One question

is whether God can place one body at the same time in two places. 'For my part,' he says, 'I do not regard it as a problem, but I hold the affirmative part to be most certain.' The first proof which he adduces is that St Ambrose said mass at Milan while at the same time he assisted at the funeral of St Martin at Tours. His fifth proof is characteristically scholastic: 'God can put an angel or a soul in two separate places; therefore He can do the same with a body.' The antecedent is thus proved: The soul of Sortes is in his head and in his foot, but God can make his soul cease to inform the middle parts of his body. The soul remains in his extremities, and so in two separate places. Then, again, there is a subtle point about fasting, the treatment of which would hardly, we imagine, convince a modern examiner in 'Greats.' It is possible, Major assures us, to eat flesh-meat in Lent and yet to fast canonically. For beans and peas contain little animals (*bestiolæ*). Again, take the case of the beaver. He always keeps his tail in the water and his forepart outside it. So you may eat the hinder part without breaking your fast (that is, the submerged end is equivalent to fish!). If Major's claim to fame rested on no sounder base than these trivialities, we should readily dismiss him with the scornful terseness of the *Encyclopædia Britannica*. But not so readily can we ignore the arresting sketch he gives us of the 'Greater Britain' of his age, or turn down his spirited appeals for union between the countries north and south of the Border. In one regard, at any rate, Major was distinctly an inspired political seer, a thoroughly practical mystic. And the qualifications of this travelled Scot to inform us about certain aspects of the Europe of his day and its life and thought, a short glance at some of his experiences will perhaps suffice to establish.

III.

Born in 1469 or 1470, in the parish of North Berwick, John Major or Mair appears to have been the son of a small farmer of Church lands. To a lad of parts and promise his country has ever afforded ready encouragement, and accordingly it is permissible to conclude that the school of Haddington, where a little later John Knox was a scholar, first received him. He then chose the vocation of a travelling scholar, a mediæval first-step which would have attraction in plenty to-day for a young student anxious to converse with his kind in distant centres. At the age of twenty-three, in 1493, he found his way to Cambridge, which, for all the higher reputation of Oxford (which he frankly admits) and the rival claims of Balliol College, was the university preferred by his countrymen. He became a member of God's House, the earlier foundation, which was converted in 1505 into Corpus Christi College, which he chose for the queer reason that it was situated in the parish of his country's patron saint. The bells of Cambridge seem particularly to have charmed and fascinated him. 'During the great festivals,' he tells us, 'I spent half the night awake listening to the bells.' Yet, with the impartiality habitual to him, he concedes that the bells of St Osney, the cradle of Oxford, are the best in all England, and adds that 'as in music the English excel all nations, so they excel in the sweet and artistic modulation of their bells.'

In 1493 Major passed from Cambridge to Paris (probably his original destination), which at that time contained the most famous university in Europe. Thither thronged students from almost every European country, from Scandinavia, from Spain, from Scotland. At a low estimate, there were computed to be ten thousand students there, nor was Europe by any means as densely populated as to-day. National jealousy and the growth of Oxford and Cambridge had recently withdrawn the English students, and the Scottish students who stayed on were at this time enrolled in the *Natio Alemanica* instead of the *Natio Anglicana*. Before crossing to Paris, Major appears to have seen a good deal of England in one way and another, and his remarks about that country are interesting, as those of an intelligent contemporary observer. The population of Paris at this time he calculates to be three times that of London. It was the business of the Mayor of London to see to the corn-supply, and if there was not enough corn produced in the country, to import it. On the Thames, near London, Major noticed between three and four thousand tame swans, though he adds, after the manner of a Scottish Herodotus, that he never counted them. York is the second city of England, though not rich and populous, and Norwich the third, where a kind of cloth called Ostade is manufactured. Of the English universities, he tells us that the number of students is four or five thousand in each, and that it takes *seven or eight years* to take one's M.A.! 'They do not pay much attention to grammar.' Though the number of laymen (that is, townsmen) is greater, 'they do not venture to rise against the students, who would soon put them down. The students are all adults, and carry swords or bows, being for the most part of good birth.' The little sketch closes with a comparison (in favour of the former) between English and Scottish ecclesiastics; and, to show how little the main traits of national character change, after all, through the ages, we must add his concluding remark: 'For courage, prudence, and other virtues the English don't think they are the least nation in the world, and if they meet a foreigner who has parts or bravery, it is much to be regretted, they say, that he is not an Englishman.' Major graduated as Licentiate in 1494, and as Master in 1496; taught philosophy as Regent in Arts down to 1505; and then took the degree of

Doctor of Theology, remaining in Paris for some twelve years.

IV.

During this long sojourn the inspiration of stirring events and decisive tendencies cannot have been lacking. The Renaissance, upsprung in Italy in the fourteenth and fifteenth centuries, was in its heyday. In the sixteenth century it had crossed the Alps and asserted itself, with Erasmus as its pioneer, in England, Germany, and the Low Countries. France was consolidating her dominions by completing the absorption of the great feudal houses, and, though driven forth from Italy, was absorbing the arts and manners of the southern land. A long succession of events had sharply accentuated the hostility between England and Scotland, and, as a consequence, a warmer welcome than ever was extended to Scottish students in the French capital.

And the wondrous charm and beauty of that city itself! Certain old plans and maps of the sixteenth century still exist to give us an idea of its general arrangement, and such seventeenth-century views as those of Zeiller, while adding to our topographical knowledge, represent, in all probability, the main features of the Paris Major knew. But by far the most vivid reproduction of the aspects and spirit of mediæval Paris and her university a modern can hope to find is that given to us in words by Victor Hugo. To quote this description at full length, or anything like it, would, of course, be impossible here. But a few sentences from the master's pen will not be amiss, for they give us more than vague indications: they evoke an atmosphere. 'The university,' writes the great novelist, 'crowned the left bank of the Seine. . . . From the one end to the other it was a homogeneous, compact whole. Three thousand roofs, whose angular outlines, adhering together, almost all composed of the same geometrical elements, seen from above, presented the appearance of crystallisation.' The number of colleges, he tells us, was forty-two, and 'the summits of these beautiful buildings were the productions of the same art as the single roofs they overtopped.' Hugo specifies some of the glorious erections which 'made magnificent inroads among the picturesque garrets of the left bank.' Of these the Hôtel de Cluny still remains to charm the artist, as does the square tower of Sainte Geneviève, to fill us with longing for the rest. Then there were the Rouen palace and the Baths of Julian; the Sorbonne, half-college and half-monastery, whose admirable nave still exists; many abbeys, many cloisters, the Mathurins, the Cordeliers, and the Augustinians' graceful steeple. 'The churches, both numerous and splendid, of every age of architecture, from the circular arch of St Julian to the pointed ones of St Séverin, overtopped all, and, like an added harmony in this mass of harmonies, shot up above the slashed gables, the open-work pinnacles and belfries, the airy spires, whose line was a magnificent exaggeration of the acute angle of the roofs.' Nor must we omit Hugo's glorious passage about the Paris bells—the less so when we remember Major's predilection for bells: 'Behold at a signal proceeding from heaven, for the sun gives it, those thousand churches trembling all at once. You hear solitary tinkles pass from church to church; then see (for at times the ear too seems endowed with the power of sight) all of a sudden, at the same moment, how there rises from each steeple, as it were, a column of sound, a cloud of harmony. At first the vibration of each bell rises straight, pure, separate; then, swelling by degrees, they blend, melt, and amalgamate into a magnificent concert. Say if you know anything in the world more rich, more dazzling, more gladdening than this tumult of bells, this furnace of music, these ten thousand brazen tones, breathed all at once from flutes of stone three hundred feet high, than that city which is but one orchestra, this symphony as loud as a tempest.'

How such scenes and sounds must have burst upon the senses of the poor Scottish student, the capital of whose homeland at this time contained but some four or five thousand houses! 'With one narrow street,' as Mr Æneas Mackay puts it, 'from the Castle to the Abbey, the backbone of a skeleton ribbed on either side with vennels, wynds, and closes, which ran on the north to the North Loch and its marshes, on the south to the lower level of the Cowgate, here and there varied by a small church, monastery, or hospital, but only with a collegiate church, St Giles', for a cathedral, the plain Tolbooth for a Palace of Justice, and Holyrood, recently built in imitation of a minor French palace, for its royal residence, as yet without a college, without mansions, and without walls.' The Paris atmosphere was one of beauty and of learning alike; their very surroundings lifted the minds and hearts of scholars from all lands when they passed to their glorious heritage and received the freedom of the dream-domain where the mighty past outpoured its wealth of arts to mingle with the gathering streams of that science which was to fertilise the yet more mighty future.

V.

Not that the *gîte* of the poor scholar in Paris at this time was altogether a bed of roses. In Major's day the college of Montaign was presided over by a Lowlander, one John Standouk. This warden—of whom Erasmus says that you could not dislike his temper and must covet his qualifications—saw with regret (in the words of Crevier, the university historian) 'that the bursaries founded for the poor had often been swallowed up by the rich' (a tendency not confined to the sixteenth century), 'and determined to found a college for the true poor.' To achieve

this end he determined to submit the members of his college to the most rigorous and ascetic discipline. Bread, beans, eggs, herrings—sparse rations of these—and no meat, formed their normal diet, which was varied by the fasts, all of which they strictly kept. They rose at cock-crow, constantly chanted the Church services, worked in the kitchen and the refectory, cleaned and scrubbed, and did all the menial work of the college. They wore a small cape or hood with their peculiar dress, and from this got the name of Capetians. Standouk's motive was of the best, but the rigour was overdone, and Erasmus—who says of himself that he had a Protestant stomach but a Catholic soul—inveighs against it in a biting satire. Major, however, appears to have come through all right, for we next find him hospitably adopted by the Navarre College, with the income of a fellowship and with a theological professorship.

In his new quarters Major seems to have prominently associated himself with the cause of the 'Gallican Liberties,' whereby the supreme authority of the Pope on questions of faith when opposed by a general council was called in question. This is in no way to say that he had any leanings to Protestantism, which he detested, or that he would have subscribed to the far more advanced views in regard to this matter of his pupils Knox and Buchanan.

From Paris, where it is odd to remember that he must have been a contemporary of three such diverse personalities as Loyola, Calvin, and Rabelais, Major, after a spell of lecturing at the Sorbonne, the stronghold of orthodoxy, returned to Scotland, and in 1518 became Principal of Glasgow University, where perhaps he numbered John Knox among his pupils in the then small but beautiful city. Thence, five years later, he was preferred to the premier university of Scotland at that time, St Andrews, where he held various academic offices, including the post of Dean of a Faculty, probably theology. St Leonard's, or the New College of that university (in contradistinction to the older college of St Salvator), was modelled on the college for poor students at Louvain, which itself was a copy of Montaigu College. A principal, four chaplains, and twenty poor scholars, instructed in the Gregorian chant, and six of them students of theology, were on the foundation. The discipline was strict, according to Prior Hepburn's statutes. There was an entrance examination for the scholars, who were to be not older than twenty-one, poor, virtuous, versed in the first and second parts of grammar, and good singers. They were taught grammar, poetry and rhetoric, logic, physics, philosophy, metaphysics, and one of the books of Solomon. It was to St Andrews that George Buchanan, the great Humanist-to-be of Scotland, came, attracted by Major's learning. There was a great contrast between the conservative and traditional scholar and his progressive, graceful-minded pupil, and there is every reason to doubt whether the latter's irritation with Major's old-fashioned habit of thought did not blind him to the fullness of the old man's mental power.

VI.

Much of Major's *History of Greater Britain* is good reading still, and Mr Archibald Constable's fine translation from the Latin now renders it accessible to all. It tells us of the early history of England and Scotland up to the marriages of Henry VII.'s daughters. It advocates, as we have already mentioned, the union of the two countries, pointing out the national and individual advantages of such a fusion. The work is not too kind to the Scottish nobility, whose tyranny and lack of patriotism it rebukes. Reform in the Church is strongly advocated, and the prevalence of pluralities is condemned. Major reveals himself a strong anti-Semite, and opines that all Governments would do well to expel the stubborn Hebrews, unless they kept them to tax them heavily. The book abounds in curious touches. Discussing the French proverb 'As proud as a Scot,' he says: 'I do not deny that some of the Scots may be proud and boastful, but whether they suffer more than their neighbours from such-like faults, I have not made up my mind.' He is angry with St Jerome for having said he saw certain Scots in Gaul eating human flesh. Even if it were true, he says, it would reflect no discredit on their posterity. And he has quite a lot to tell us about the reasons why the men of Rochester are born with tails. 'It will not be,' says Dr Law, 'to the honour of the guardians of Scottish literature if its most precious relic of pure, unadulterated mediævalism is either obscured or forgotten.' The Scottish History Society, by very considerably reducing the risk of either fate befalling Major's *Greater Britain*, has performed a service to mankind.

In conclusion, it may be repeated that Major was emphatically no precursor of the Reformation. Nor, for all his erudition, had he the slightest sympathy with the Renaissance and its spirit. He is a fine old Scottish Schoolman, all of the olden time, who writes feelingly to Dr Eck of 'the new and detestable calamity to the Catholic Church, the execrable heresy of Luther and of those who from him have learnt to blaspheme Heaven.' In order to refute these heresies, he tells us, the Sorbonne began to have recourse to the study of the Scriptures, but the Faculty of Theology, fearing that this study would render the minds of the students torpid, ordained that they should revert to the older methods of discussing subtle questions. In other words, as Dr Law observes, the Theological Faculty, after a moment's hesitation, hastened to arrest any incipient tendencies to educational reform. John Major would have slept none the less soundly o' nights for that.

THE MOUNTAINOUS MR NEUBURG.

By W. DOUGLAS NEWTON, Author of *War*, *The North Afire*, *The Undying Story*, *Phillip in Particular*, *The War Cache*, *Green Ladies*, *Westward with the Prince of Wales*, &c.

CHAPTER V.

I.

THE two cars rushed through the night switch-backing up and down the strange streets of that strange town. Clement had the queer feeling that he was passing through a dream-city created by some fantastic fairy-tale illustrator. The streets of Cobalt wound hap-hazard amid houses built hap-hazard. The bumpy driveway wriggled between houses now on the road-level, now hanging above it on rocky outcrops. Now an ordinary side-road was passed in the dusk. Now a flight of stairs shot upward in place of a road.

The houses of Cobalt clung and grouped where they could. Bold rocks piled out between the houses, or loomed over them. Now houses and rock would give way to Martian-looking mine-workings: humpy, corrugated-iron sheds, the lattice and the cables of overhead conveyers, the great, smooth slack-dumps of the mines. . . . Then more houses. Through this fantastic place, over and down fantastic hills under the pallid light of electric standards, the two cars flashed.

'We've got him,' said Clement cheerfully, looking out at the speeding car ahead, 'and we'll get Neuburg through him. That is, if your driver'——

'That's all right,' said the detective, Gatineau. 'He's game. I put him wise before I hired him. For twenty dollars and a little excitement he'll do all you want him to do.'

'There may be gunning,' said Clement, falling into the idiom.

'He knows that. All he said was that the burg has been kind of sluggish, anyhow, for the past six months. . . . This is a mining-town, you know. Don't you worry—he thrives on excitement.'

The cars swept out of the town. Between the stiff, rocky hills and the giant humpings of silver-mine workings they were pressing towards the wild tracts of the open country. The road grew deliriously worse.

'What about head-lights?' asked the detective. 'We don't want Siwash or his driver to see us.'

'They haven't yet,' said Clement. 'That rear lamp would go out if they did. It's a closed car, anyhow, and unless we were right up to them I don't think they would notice our lights. But to be on the safe side they might be half-switched down, though.'

He rose and spoke to the genial and husky driver about this.

'Sure,' said that individual, and he checked down his lights until there was but a faint radiance on the road before them. 'If this wasn't such a hell of a trail, I'd cut 'em out altogether. Must have some light. I'll bump my springs to scrap else.'

'Put down all repairs to us,' said Clement. 'You're a good scout to take this on. There may be trouble.'

'Ain't exactly done tatting all me life meself,' grinned the driver.

'I guess you haven't,' smiled Clement, looking at his burly figure. 'Where are those chaps heading for?'

'Hudson Bay and the Arctic Belt gen'rally, sh'd say, from the way they're hitting it,' grinned the man. 'Somewhere fresh t' me, anyways. Not that I mind novelties; only, I hope this trail holds to wherever they're going.'

There was, indeed, every indication that the trail would not. It had become astonishingly rough, so that the men in the car bumped and soared on the padded seats in an astonishing way, their only satisfaction being that Siwash and his companion in front were also feeling the strain, and had checked their pace down to something more humanly bearable.

And as the road grew rougher the country became more inhospitable and empty. Its emptiness, in fact, was impressive. They had, some time ago, left the last vestige of the township behind them. They had passed the last of the outlying mines, the blank and almost inhumanly empty grouping of a discarded and probably forgotten working. They were now heaving and shouldering along this strange trail, where the grass proclaimed a lack of traffic, going always into a bleak, strange land where not even the bark of a dog gave indication of the dwellings of man. The enormous emptiness of it weighed down on the mind. It might be a virgin land where white men had never yet penetrated.

Indeed, as the driver had humorously suggested, they might be heading for the great lonely land of the Arctic Circle and the empty stretches of the James and Hudson Bays. And still they drove on over the appalling trail, the driver sweating and wary over his kicking wheel, and muttering quiet, deep swear-words as he ran resolutely on.

'A hell uv a road,' he muttered. 'A hell uv a road. What's got him? . . . He's bughouse, surely. Where's he goin'?' He beckoned Clement with his head. 'That feller in front's

got me guessin',' he said. 'The only thing is—— Well, see, it might be an old through trail to the Harricanaw River. . . . That'd hit the railway somewhere about O'Brien. . . . That's the only thing. . . . Mebbe that's where they're goin'.'

This suggestion, though it meant that the chase would still go on, and that Clement would not come to grips with Neuburg and his gang, as he devoutly wanted to, was not altogether unpleasant. As they pushed deeper and deeper into this cruelly lonely country he had experienced a definite touch of fear. With a sense of dismay, from which he strove to keep a feeling of horror, he was visualising the position of Heloise out here in this complete isolation. Out here in this vast, bleak emptiness, and at the mercy of Neuburg and his gang of desperados, what might not happen to her? She was beyond all chance of succour—save, of course, that which he and Gatineau could offer.

And he and Gatineau—what could they do? Two, and with the driver, who appeared a useful member of the community, three—what could they do against a gang? A sudden, swift stroke of rescue might accomplish the business; but if it was not sudden or swift, if it failed, what would the *dénouement* be? They were right away from help. If he failed Heloise, then, it must be the end. There would be no further hope of saving her.

But if they were merely going through to the railway at O'Brien, inexplicable though this was, there was very much more reason to hope. That would bring Heloise again within reach of human beings and human help, and, too, there were more chances of picking up a lost trail than in this wilderness. On the other hand, why were they dodging across country to that distant railway, when an ordinary train from Cobalt to Cochrane would have been so much simpler? That fact did not fit in. The whole thing was bafflingly mysterious. Think as he could——

'Hello!' said the driver, with a jerk. 'Rock again—silver-rock, or I 'm a piker.'

The country over which they had been passing for, it seemed, hours had been flat. Now it suddenly became broken up. The hard rock was thrusting its way up through the thin soil, first in little outcrops, then in mounds and bluffs that resembled the ground at Cobalt. The trail, which had gone forward as directly as an arrow, now began to twist, worming round the rocky pockets, for ever finding the most negotiable way. Then, in the midst of his automatic and quite unsplenetic growls at the tricky steering this new circumstance demanded, the driver said, 'Hey, *look* at that big Swede.' And then he said, 'Hey, but just you look at him hitting it up again.'

He himself began to open out until the needle on the dimly lit speedometer was crawling well past the twenties.

It was a fact. The car in front of them, the car in which Siwash rode, had abruptly increased its speed. From its steady but cautious pace, it had suddenly started to run away.

'Have they seen us?' asked Clement.

'Not they,' said the driver. 'That's the explanation.' He pointed ahead of him towards the trail. Even as he pointed the reason for the change of speed became obvious. The car ceased its wild and stormy bumping. They were still pitched about, but no more than they would have been in the same circumstances on an ordinary Canadian country-road. The rough trail across country had ceased; they were on a road. As they wound in and out among the rocks they could see the fairly even and rutted surface under their head-lights.

'Where are we? What road?' demanded Clement.

'I miss my guess,' said the driver, his eyes fixed warily ahead for the abrupt and surprising twists. 'I haven't any answer. I don't know more 'n you. It's Nowhere in the middle of the Neverwas fer me.'

They ran on, twisting and turning along the crooked, rock-dodging path. Clement's pulse began to beat with excitement. A made road—that meant a house. A house meant——

The driver spoke abruptly, his expert eye flashing to the side of the track and back again with a darting glance. 'Thought so. . . . Workings.' He pointed with a stabbing finger. 'Stuff taken out of there—see. Ugh, ye brute! *do* ye want to go prospecting wid yer nose?'

Clement looked to the side of the trail, but saw nothing of the signs of mining which the driver noted at a glance. But he saw and felt the road, saw signs of the presence of man in that, and he felt that they were coming to the critical point of their ride. He braced himself alertly, looking ahead. His hand went into his pocket, took out the automatic pistol, and held it ready.

'Water, see,' said the driver, jerking left, with his ear, to where something shimmered flatly and eerily in the dark.

Ahead of them the red light of the rear lamp tilted and vanished.

'Hell!' groaned the driver, and working his hands one over the other like a strenuous pianist, he whipped the car round an 'S' curve into a straight, round another curve, and caught the distant twinkling of the red light again.

'They 're moving away,' cried the detective, now by Clement's side.

'They know the ground, hang 'em!' said Clement.

'There 's the outfit,' stabbed the driver. 'You look. Don't want ter pile her up.'

Clement imitated the action he had just seen the driver indulge in. That is, he bent low down so that he could catch faintly the black silhouette of the earth against the fainter darkness

of the sky. He saw merely masses of dark shades on shadow—fantastic, indeterminate shades—rocks, no doubt. . . . Then—yes, there was the tall, square shoulder of an iron mine building, the frail fret of derrick against the dark, and the humped mound of slack.

'I see it,' he cried. 'That 's the place, for a certainty.'

'Seems so,' growled the driver. He swore deeply. He had lost the tail-light. He was labouring round another cruel bend. He straightened out. 'Where in creation '—— he began, searching for the red light.

'There,' cried the detective.

'There,' cried Clement. 'Straight ahead. Why, we 've got 'em. We 're on top of 'em. We 've got 'em sure.'

There was a sudden and appalling bump.

'Fer th' love of Mike '—— yelled the driver. He wrenched frantically at the wheel. 'We 're off the trail—off '——

There was a sudden succession of terrific and violent bumps. The car seemed to jump. It thrust forward, sank, kicked again, buried its nose deep, and threatened to capsize. Then the hind-part sank softly and squarely. . . . There was no more motion.

The all-but-buried head-lights, as the driver instinctively switched them full on, shone on a flat, moist surface that threw back the rays with a curious, livid shine. The driver swore deeply.

'Steve,' he cried to Clement. 'Steve, we 're done. We 're knocked. We 're beat. . . . We 're *bogged*.'

In the distance the red light dwindled and dwindled, and abruptly was lost.

In the first car Siwash, leaning towards Joe Wandersun, smiled his cold Indian smile. 'They 're in it, pard,' he said. 'In it up to the lamps. That settles *them*.'

II.

Clement, in a jump of rage, tore at the door of the car, opened it, and made to leap out.

The detective gripped his arm. The driver, leaning back over the seat, joined the detective in that grip.

'Here, Steve,' snapped the driver; 'you quit that. Don't you be in such a lively hurry.'

'We can get to these buildings in time—but we must hurry,' snapped Clement angrily, trying to struggle free.

'You can not,' said the driver. 'You can get up to your occi*putt* in enduring mud, Steve, an' that 'll be about the limit o' your carnal activities. What we 've hit is a slime lake. That mine dumped into here, see. It 's probably a little more solid than water, but more uneasy to swim in, see.'

'But—but—man, we must do something,' cried Clement.

'Sure, Steve, but with circumspuction. As we ain't sinking no more, we have a sure base or deepo to work from. By workin' cautious '——

'And while we are being cautious—with our lights full on—what will be happening at that mine, my good chap?'

'Not much,' said the driver. 'A coyote prowling round, a bat flutterin' hither an' thither. Not much more, Steve. This mine is an abandoned mine, Steve. C'n tell that by the surface o' th' slime.'

'An abandoned mine!' snapped Clement in an edgy voice. 'But that 's just the place '——

'Moreover, Steve,' said the driver—'moreover, our pals in the forward car did not go to or enter said abandoned mine. Take that as law, Steve. For why—I saw their head-lights flash on the building and pass. I saw them lights shine on the landscape a hundred yards beyond. I saw them lights turn beyond a big outcrop of rock further on, going away left, Steve, turning their back on that old mine.'

'They 've gone on?' gasped Clement, in a tone of despair.

'They sure have,' said the driver. 'An' it 's no good feelin' sore about it. Circumstances is just gone bad on us, an' that 's that. No call fer chasing a "Hudson Six" to Baffin Bay on the unaided feet.'

Clement, his eyes still fixed on the point in the darkness where the red light had vanished, dropped back into his seat. 'What exactly happened?' he asked, more in a groan than anything else.

'We got bogged,' said the driver, with a touch of irony. 'I was the tin-horn, an'—well, we got bogged. See how it is? That trail takes a sharp loop round this lake. I came round in a crazy hurry, missed that tail-light—that was because they had swung round on the sharp turn. Then I picked it up dead ahead—that was when they found th' straight again after getting round th' lake. Me being that tin-horn, I took me eyes off the trail for a fleck and drove right ahead instead o' goin' round. And—and—well, Steve, we was well and duly bogged.'

Clement groaned. Again, through the veriest slip, he had lost his chance of saving Heloise.

'If they 'd planned it, they couldn't have beat us to it better,' said the driver, with a curse.

'Perhaps they did plan it,' said the detective, Gatineau, softly and suddenly.

'Eh?' gasped Clement. 'But, of course, they didn't do that. How could they know we '——

'Then why are they turning back?' said the detective. 'There, abreast of us, between those two rocks.'

Clement and the driver swung their eyes to the left. Between the two rocks, distantly, they saw the glow of automobile lamps. They shone steadily. Then the rocks hid them as they moved. Without a word the men in the

bogged car sat staring into the darkness, searching it for those glowing lights. They came again from behind a rock. Now they were well to the rear. The significance of those lights was unmistakable.

'They 've circled,' said Clement.

'You 're dam right,' said the driver angrily. 'They 're heading to cut the trail behind. They 're going to make Cobalt again by the same road.'

Before he could say anything further Clement was out of the car. He plunged desperately, slime or no slime. He went down over his knees in the viscid stuff. Dragging his legs, he jumped forward. He found a shelf of rock, strode off it, again up to his knees. He went on. He slipped and half-fell in a deeper pocket, and with the effort of recovery found himself on ground that was but shin-deep. He plunged forward, and a bush whipped his face. He was on grass, on solid ground, at once.

He ran back along the trail until he met the face of the rock where the turn had been so disastrous to them. At this he sprang, clambering upwards. It was a hard, steep climb, but he was glad of it. The higher it was, the more commanding a position it would give him. He knew he was at the summit by the sudden sight of the departing car lights he obtained. But even as he scrambled erect those lights disappeared, leaving a faint, moving glow only.

Clement followed that steadily with his eyes. Then, as the lights abruptly flamed into view, his hand went up, and the automatic pistol in it spoke, and spoke again. As he fired the lights disappeared, and he wondered if he had hit. They came again, and again he fired. He emptied his clip, and jerked out an exclamation of anger as he reached, snatching into his pocket for a fresh magazine. As he did so the lights vanished once more.

He heard a man panting by his side, and the detective Gatineau's voice said, 'Too far and too dark for fine shooting, Mr Seadon, I'm afraid. Also, it 's quite illegal.'

And even as he said that, Gatineau's own automatic was pumping off, to be joined at least ten seconds later by the snap of Clement's pistol.

But the darkness and the distance were against them. Both men fired once more when the lights showed, but the car appeared to go steadily and calmly on its course. Soon it swung into the trail, and all that could be seen of it was the upflung haze of its great lamps. Presently even that was lost, though they could hear on the almost preternaturally silent air the drone of the car's engines as they dwindled and sank into the distance.

'Yes, you were right. It was planned, and we were tricked—deliberately tricked,' said Clement harshly, as he turned to clamber down to the car, and he did not, indeed could not, speak again, so hot was his anger against himself. When he reached the edge of the slime lake, within hailing distance of the stranded car, he called to the driver. 'It was a trap, after all. A trap to maroon me out here, miles away from anywhere'——

'About forty miles from Cobalt station, anyhow, Steve,' said the driver. 'Forty miles, if it 's an inch.'

INDIAN JUGGLERS.

MORE WONDERFUL TRICKS.

By C. L. HARDCASTLE.

I.

AS a supplement to the interesting account of some fearsome tricks performed by a small company of Indian jugglers, published in *Chambers's Journal* for September 1920, perhaps the following account of two or three so-called tricks may be of interest. It is many years ago since I witnessed them, but they impressed me so that I have never forgotton them or any of the details. It was as far back as 1873 or 1874. I had not been long in Bombay, and having heard so much of the wonderful feats some of these men can perform, I told my 'boy' that the first time he came across a really first-class performer, he was to bring him to the bungalow. I had seen the ordinary street jugglers with their basket and cobra tricks, and not having been much impressed, I wanted to see a first-rate performance.

Before very long, on a Sunday afternoon, four or five of my chums, who had breakfasted with me after the usual Bombay Sunday cross-country ride, were sitting at my side on the veranda, when the 'boy' announced the arrival of an A1 juggler.

He was an old man with long gray hair and beard, and came alone, with no paraphernalia. After the usual Eastern salutations, he quietly told us that if we would give him fifty rupees he would show us such things as we had never seen before. On the recommendation of the 'boy' we agreed, and being young and irresponsible, we assured the juggler that if he did not give us our money's worth he would know all about it! The old villain smiled and acquiesced.

II.

Leading up to his big tricks, he performed some simple ones. For instance, borrowing a rupee from one of us, and taking it between finger and thumb of both hands, he pretended to break it in half, and threw down *two* rupees. This he continued to do till he had before him a heap of some forty or fifty. Politely handing back the rupee to the man from whom he had borrowed it, he then unwound the wisp of white muslin he wore as a turban and packed up his 'miraculous hoard.' It is to be noted that he was naked, except for a very scanty loin-cloth, and had no bags or baskets with him, and was performing on a gravel drive in front of the house steps.

After one or two other minor tricks (I presume to fill up time), he asked for some curry-powder of three different colours. These were supplied him out of the kitchen. The powders he mixed in one of our coffee-cups, adding water, and then swallowing (or pretending to swallow) the mixture. Bending down on his hands and knees, he now asked us to say which colour we should like. On the colour being called out, he blew out of his mouth, quite dry, a little mound of the curry-powder; and as the various colours were asked for he very kindly accommodated us with the requisite article. Apart from the problem of colours, how did he blow out the powder *dry* and not wet?

Another trick was the same as described in your previous article, but with one or two variations, which made it more strange. I was then in a French financial institution. All our stationery came from Paris, and our office string was of twisted red, white, and blue strands. Our ancient friend asked for some string, and a parti-coloured ball was handed to him. He cut off some five yards of it, and insisted that one of us should cut it up into small pieces, which done, he made a small ball of it and swallowed it (or pretended to do so). He then asked one of us who had a penknife to make a hole in his side. I, as the only possessor of the necessary implement, stepped forward and gingerly pricked him under one of his ribs; but he was not satisfied, so seized my hand holding the knife and jabbed the blade into himself to its full length! I was then instructed to squeeze the wound till the end of the string protruded, and I pulled out several feet of the string, leaving it to him to finish the rather unpleasant operation.

One most mysterious trick came about in this way. Of course, there had been a good deal of chaff and 'ragging' of the old man, and in the end he appeared to lose his temper, called us Christian dogs and unbelievers, and levelled at us other pointed abuse, ending up by saying, 'Even if I called down fire from heaven, you would not believe.' We assured him with many soothing words that if he could do *that* we should certainly 'believe.' We were none of us quite clear as to what we were to believe, but let it pass. After some sort of reconciliation, our friend prostrated himself on the ground and apparently passed into some kind of a fit, foaming at the mouth, his arms and legs twitching. After a time he became still, then suddenly jumped to his feet, with arms outstretched to heaven, and called loudly, '*Rama, Rama, ag do*' ('Rama, Rama, send fire'). Immediately a rain of fire fell round us. I, for one, ran out and caught some in my hand, and it burned. The appearance of it was what one could imagine a lot of cigarette-papers all blazing would look like.

III.

We thought this ended the *séance*, but there was one 'trick' more—indoors this time. We all trooped into the dining-room. To make intelligible what followed, I must shortly describe the room. It was very big, with a dining-table capable of accommodating some thirty people. The rest of the furniture was of very heavy and solid Bombay black wood, the side-board, a kind of buffet, filling up most of one wall. We were told to go through the folding-doors into the drawing-room, and to shut them. As soon as this was done we heard an appalling uproar. When all was still we were called into the dining-room, and our gaze fell on all this heavy furniture taken to pieces and piled in a heap in the middle of the room. Then we were sent back into the drawing-room, when we heard the same racket. On going back we found all the furniture once again in its proper place.

Our friend the juggler then made salaam and asked permission 'to take his leave,' not forgetting to secure his fifty rupees.

So ended one of the most astonishing collections of tricks I have ever seen. The only possible explanation I could give myself was based on the hypothesis of hypnotism. I leave others to give another plausible explanation. I always have blamed myself for three omissions in my observations: for failing to notice (1) if the wound bled in the string trick; (2) whether the wound remained visible during the rest of the time; and (3) whether the fire I caught in my hand left any ash. This juggler looked like a Sikh, but spoke the Hindustani prevalent in the Bombay Presidency. I was so eager to rectify my omissions in observation that I let it be known that I wanted to see our man again; but apparently he never revisited Bombay. At any rate, I never got hold of him again. As to the rope trick, for all my efforts I never saw it, nor have I ever met any one in India or at home who has; although I did hear once of a man who said he had witnessed it and had photographed it, but when the plate was developed it was—blank!

There are more things in the East than are dreamed of in our philosophy.

A COMPOUND COINCIDENCE.

By T. F. Dewar, C.B., M.D., D.Sc.

I.

IT is fully twenty years since there occurred the concluding episode in a rather remarkable chain of coincidences in which I was involved. At that time the first year of the South African war was nearing an end. It is true that the events of the last decade have not merely thrown into the shade the doings of that time, but have gone far to blot them from national memory altogether. Still, a notable incident of those days may be worth recounting.

The tale begins a few years before the Boer War. It was in 1891 that there was held a race-meeting in the little town of Carnoustie, on the east coast of Scotland, about midway between Aberdeen and Edinburgh. I do not think that the gathering was conducted with very strict formalities; but it proved very popular, attracting entries for the various open events from all parts of the country, a large crowd of spectators, and the usual assembly of bookmakers and of the racing fraternity generally. I had a particular and personal reason for being interested in the occasion, for my friend Dr Barclay possessed at that time a fast, dark-gray Irish hunter, standing perhaps 15·2, and had decided to enter him, owner up, for the one-and-a-half miles flat event. Knowing the qualities of the horse and the capable horsemanship of the rider, I looked forward keenly to the meeting; and when the hour came and the crowds were lined up, the jockeys all ready and the flag about to fall, I was in a state of no little excitement.

I was destined, however, to see very little of the race. Scarcely had the horses stretched to their work than distracting events occurred. Within a few seconds, two accidents happened at different parts of the course. The said course was of oval shape, and at one corner it passed through—or at least near to—a group of beech-trees. A horse fell there at the curve, slipping, it was said, on an exposed tree-root. The rider fell heavily, and sustained a compound fracture of his right thigh.

Less than a minute later, and at the opposite side of the field, another accident occurred. There, also when rounding a corner, a rider came to grief. Ligertwood, a young jockey, broke his off-stirrup leather and fell to the ground, sustaining a simple fracture of both tibia and fibula of the right leg. Parlane and Ligertwood, the two unfortunates, had been riding second and third place respectively, but the race had been only half run when they fell. In view of these unhappy incidents, Dr Barclay's victory gave him but little satisfaction, and the whole atmosphere of the day changed from one of gaiety to one of anxiety and distress. Two or three doctors, myself among them, hastened to attend to the injured men. It fell to my lot to look after Ligertwood, the young fellow who had broken his leg-bones just above the ankle. A considerable crowd gathered about the injured man, and several policemen had much ado to secure a space around him. While I was applying first-aid splints as a preliminary to moving the patient from the field, two young men, assisted by the constables, pressed in through the spectators. 'We are medical students,' said one to me; 'can we help you?' By that time, I fancy, there was little for them to do. Anyhow, I forget what I replied. I did not, however, forget their kind and well-meant offer of assistance.

After a little delay, we got both the injured jockeys to the station, and saw them off on stretchers in a railway-van to the hospital in the neighbouring city. Nine days later I was able to pay them a visit in the surgical ward of that infirmary. Parlane, poor fellow, had just begun to suffer from a stiffness of the muscles of the face, the first symptom of the lockjaw from which he died a week later. Ligertwood, on the other hand, had already got over the worst of his accident, was sitting up in bed, and smiled a grateful welcome to me as I entered the ward.

II.

Up near Mafeking—about eighteen miles south of it, to be precise—and on the thirteenth day after its relief—that is to say, at the end of May 1900—I found myself near a place called Biesjesvlei, in the western Transvaal. My unit formed part of an enormous and heterogeneous column, under Sir Archibald Hunter, that was moving northward towards Pretoria abreast of the central column which, on our right, under Lord Roberts himself, was making for the same goal. The war, as we thought, was 'nearly over.' (Undaunted by disappointment, we went on thinking so for a couple of years!) My duty on the day in question was the prosaic one of riding with the ambulance. I was glad of the change of work. Most days my job was to ride far out in front or on the flank, on the cavalry screen, and that implied a considerable strain on the attention. As we crawled over the 'endless plains' of the Bechuanaland border, the slow oxen necessarily setting the pace, I came upon a little group of gunners clustered round a man who sat on the ground. Some instinct led me towards them, and I dismounted, to find an unhappy bombardier the ends of

whose right forefinger and thumb had by some mischance been blown off. He had been handling some sort of cartridge or detonator, the others explained to me, something unfamiliar to him evidently, and it had gone off, taking with it the last joints of finger and thumb. I did not, of course, enlighten the men as to my profession; and they, observing that I wore the shoulder numerals of a private in the yeomanry, doubtless assumed that I was a medical orderly. Moreover, an extraordinary but not unnatural freedom was in the air; introductions were not then in vogue. After inspecting the wounds, I rode over to the medical Cape cart, and, returning with gauze, wool, bandage, and sling, I applied first-dressing to the injured thumb and finger, and explained to the man's companions (perhaps with the involuntary tone of authority natural in a practitioner of ten years' standing) that nothing better could be done at the moment, and that the patient must come on with the column in a wagon, and receive more careful and deliberate surgical treatment when we arrived, towards afternoon or evening, at our halting-place. Just as I completed the application of my temporary dressings, a young medical officer (considerably younger than myself), who was attached to the artillery, and who had been sent for when the accident occurred, rode up to the spot. I rose, saluted him, and told him what had occurred and what I had done, and that I thought the wounds would require trimming and accurate adjustment of their edges, and, of course, stitching; but that obviously such measures could only be taken after an anæsthetic, and therefore after our arrival in camp. My confident, matter-of-fact, yet studiously polite tone seemed to impress the young medical officer (as I had intended that it should!), and I saw him glance curiously, as the gunners had done, at my shoulders. 'You've had an ambulance class, haven't you?' he asked. 'Well, no, sir,' I replied. 'Oddly enough, I've never been a *pupil* in such a class; but I have lectured to such classes and examined for the St John Ambulance Association for several years.' Seeing his puzzled expression, I hastened to add, 'I'm a doctor in a Scottish town when there isn't a war on.' 'Well, then,' he said, with a slight smile, 'we're going to halt for the night at Biesjesvlei, some two hours on. When we get settled down, come round to my place and give the chloroform.' It was my turn to smile. 'Excuse me, sir,' I said; 'I'm not a free agent; but if you will ask my captain' (Captain Hodge, Scottish Yeomanry), 'I'm sure that he'll lend me with pleasure.'

We duly arrived at our camping-place, and, as instructed, I went over to the artillery lines, and the bombardier got his finger and thumb nicely fixed up. I have never heard of him from that hour, but I am sure that his hand did well; for, as a matter of fact, it was I who did the actual surgery, while Lieutenant Inkson, R.A.M.C., administered the chloroform. The work accomplished, and the patient having been carried off to a hospital bed, the officer whom I had assisted turned to me with a slightly embarrassed smile. 'I fear I can't offer you an operator's fee,' he said. 'Stop a moment, though,' he added. 'I can raise you a whisky and sparklet, if that's any use to you.' 'Yes, sir,' I replied frankly, 'it *would* be of use to me. I'm practically a teetotaller; still, there are occasions when'—— 'Yes, yes,' he said shortly; 'I know. Come with me.'

I went to the tent, which he shared, it appeared, with the adjutant and two other gunner subalterns. These three looked at me with surprise and question; but my host coughed significantly as who should say, 'No inquiries now, please; I'll explain later.' He brought out the whisky and sparklet, and we sat on the veld while I consumed it. 'You're in practice in Scotland, didn't you say?' he asked. 'Yes,' I replied, 'on the east coast, about midway between Edinburgh and Aberdeen.' 'Why, that must be Forfarshire,' he rejoined. 'I've been there. I studied medicine at Edinburgh, and once I went for a golfing holiday to Carnoustie. You'll know it?' 'To be sure I do,' I replied. 'I know it well; it's only seven miles from the town where I live.' We talked on. Incidentally Inkson mentioned that there had been races at Carnoustie at the time of his visit. 'Then that must have been nine years ago, in 1891,' I said. 'There were two accidents, one of them fatal, on the course that day, and I don't think there was a race-meeting there again.' 'Accidents, by Jove!' he rejoined. 'I should think there were! The man with whom I was staying and I were third-year medical students at that time, and we offered our help for what it was worth to the doctor who was looking after one of the injured men.' 'Yes, indeed, sir,' I replied; 'I recall the incident perfectly. This whisky and sparklet "fee" is superfluous, after all. To-day, in assisting you, I have been no more than repaying you for the help you so kindly offered me nine years ago, and six thousand miles away!'

III.

Twenty-three days later our column reached Rietspruit, in the Transvaal, a few miles south of Johannesburg. In the interval we had swept eastward and then turned toward the south, and we were just about to commence the enfolding movement that ended in the capture of Prinsloo and his force in the Wittebergen mountains a full month later. I, meantime, in view of the shortage of doctors, had passed from trooper's rank to that of acting medical officer, reverting formally to my old rank of captain on the following day, 24th June. We had halted at Rietspruit for the night. The

sun was nearing the horizon, and all the camp was flooded with glowing ruddy light from the west. I stood leaning against the tent-pole in the tent occupied by Bell, Bolton, Boswell, and Blair—why should I not tell their real names?—and my four hosts squatted around on the grass within the tent enjoying the unwonted leisure and the rosy evening light. They told of strange coincidences of the trek; of *rencontres* with old school friends; of the meetings of men who had long passed from one another's ken. Each had his own contribution to the series of unexpected reunions; each remarkable enough, no doubt. And here, amidst these interminable prairies and endless weary wanderings, it was impossible to say that 'it just shows what a small place the world is, after all.'

I heard all the tales patiently in silence. Then I broke in: 'I know it is bad manners, especially in you fellows' own tent, to have heard all your yarns, and then propose to tell a better one; but I can't help it. Listen to this.' And then I told them the story of the accidents in Scotland nine years before, and of the recent accident near Maribogopan, and the sequel to each, just as I have tried to tell it now. My audience sat and listened as I told my tale, looking out toward the red sunset through the open door of the tent.

Soon after I had commenced my narrative, Captain Blair's batman, a comely, well-set-up fellow of twenty-seven or so, came in to make up his officer's bed for the night. He unrolled the valise and sorted things out and shook them up, and so on; in short, he contrived to do many superfluous things in order that he might hear my story out. I can recall feeling quite distinctly irritated by his shuffling movements, my subconscious mind whispering, 'Deuce take the fellow! Why doesn't he finish his work and go?'

Finally I came to the end of my anecdote, and told how I had pointed out to Inkson that at Biesjesvlei I had done no more than repay the kindness that he had proffered nearly a decade before. And then, before there was time for words of applause or approval, Captain Blair's man was on his feet, erect at my side, his figure trembling with excitement, his eyes glistening with delight. Dramatically he asked me, before the others, all hesitation and soldierly decorum thrown to the winds, 'And what part did *I* play in that tale, sir?' The answer, recognition confirming it, flashed in a moment to my brain. With surprise and excitement scarcely less than his, I replied, 'By heavens, I know! You're Ligertwood, who fell in the race at Carnoustie and broke the bones of your leg!' My friends had to admit that my yarn, with its unforeseen *dénouement*, had proved the best of the lot.

Five months later, in November 1900, I was sent to Pretoria to report to the surgeon-general. I was having coffee in a café (whisky could by that time be procured in exchange for coin, and so was no longer the luxury it had been). A six weeks old *Illustrated London News* lay on the table. I glanced over it. A series of portraits of 'Six New V.C.'s' caught my eye, and I was interested to notice two familiar faces among the six. One of these was that of Lieutenant Inkson, R.A.M.C. (now Lieutenant-Colonel Inkson), who had won and received the highest of all battle honours for repeated acts of conspicuous bravery in Natal; who had kindly volunteered to help me in tending an injured man in Scotland in 1891; and whom I had been able to assist in return at Biesjesvlei in 1900.

THE HIGHLAND BONNET.

[Reprinted, by kind permission, from a charming volume of 'Occasional Verse' by A. Stodart-Walker (Maclehose, Jackson, & Co., Glasgow, 1920).]

My heart leaps up, whene'er I hap
Within the camp, on Highland bonnet;
A plain or dice-board Scottish cap
With tails, and toorie red upon it;
The camp dissolves—my fancies free
In happy dreams go northward roaming;
The islands anchored in the sea
All mystic in the tender gloaming!
The burns beneath the moss alilting,
The sea-mews white against the sky,
The hills their skirts of mist akilting!
The peewits' lone bewailing cry!
Would I were there myself to don it
And stride the braes in Highland bonnet!

My heart leaps up when to my ear
There floats the tongue of Scottish laddies;
The soldier men who stalked the deer,
Or paced the links as goufin' caddies;
The scene is changed; my heart is filled
With songs of Burns, so peerless telling
Of loyal hearts with anguish killed,
The cross of love at love's dispelling;
In varied moods, the lyrics run
From grave to gay with lightsome changing;
From sacred grief to ribald fun,
The gamut whole of life o'er-ranging.
Burns sieged the human heart and won it,
The pride of every Scottish bonnet!

My heart leaps up when on the breeze
There floats the sound of pipers chanting,
The droning hum of Scottish bees,
The skirl of war-cry fierce supplanting.
The scene is changed; I hear the lilt
Of crooning wails the gladness stilling;
I see the swinging tartan kilt
On every field where blood is spilling;
I hear the pipes swell fierce and loud,
The fearless ranks of Scotia leading;
Or drone laments above a shroud,
Orphean charms their notes exceeding;
When pibrochs call the Highland bonnet,
Would I were young enough to don it!

THE LOG-SCHOOL.

By MABEL DURHAM.

I.

IT was two miles from the log-house to the log-school. The road ran along the side of a mountain, part of a massive range of the Rockies which formed one wall of the valley. Down below, the great river crossed and recrossed the wide flats, and lost itself again and again in a maze of channels and lake-like sloughs, which were threaded with islands and narrow necks of land in a bewildering and fantastic network. Some of these were of recent formation, so low that they were half under water, indicated only by the young bushes that had found a foothold on them, and liable to be carried entirely away with the next high water; while others were more stable, rearing above their matted undergrowth tall alders and cotton-woods.

The other side of the valley was enclosed by a range more broken, and rising in a series of sharp peaks, which formed a jagged skyline many miles in length. Between them were deep couloirs or cañons, and down through the darkness of each a stream of water foamed and flashed, taking its way in a succession of white leaps from the snowfields above to the river below.

Over this road, which wound in and out along the mountain-side, and revealed at each turn new and more enchanting vistas of silver sheets of water and green islands, dusky gorges and tumbling waterfalls, forested slopes and snow-crested summits, all melting away into the mystic shadows of distant ranges, I walked twice a day between the two log-buildings.

In the summer the valley, which opened and widened as it swept grandly away toward the south, glowed and vibrated with waves of shifting colour. Not the lightsome pastel tints which play over hillsides in zones where there is little moisture, but the deep, rich, gorgeous tones of a clime in which nature has withheld nothing.

The tender hues of the young growth at the edge of the channels and the sloughs melted into the deeper hues of the trees on the higher parts of the tangled chains of land which defined them. These in their turn were blended with the still darker greens of the fir-forests clothing the foothills and stretching up the steep slopes of the mountain-sides. There they met the yellows and reds and browns of the bare rock-walls and sheer precipices upholding the vast snowfields over which waves of opal and rose and amethyst drifted. All these, with the silver and sapphire of the myriad channels, and the turquoise and emerald of the lakelets and lagoons, changed and interchanged, and took on fresh nuances as the sun moved across the deep-blue vault above, and with every cloud that floated over it.

Sometimes the clouds in great white billows rolled down the mountain-sides and lay along the red-veined walls of rock between the forest and the snow. And, again, they stretched across from range to range, shutting out the blue and gold, covering the valley with soft mist or gentle rain, and turning everything in it to silver and gray and purple and black. In the winter it was all white and sombre green, which the sun gilded for a few hours every day.

I lived for a year there. Room was made for me in the log-house, because it was the best one in the little settlement, which had petitioned the Government for a school, and a place had to be provided for the teacher to live. So they took me in, and did everything they could for my comfort, although it was at some sacrifice of their own.

The house was at the edge of the settlement, so that on the one side there was no other for many miles. In the long, glowing Saturdays and Sundays of the late summer I used to go up beyond the clearing, and scramble over the sunny foothills and through the dark ravines to gather the saskatoons, the blue berries, and the salmon berries which grew there, or down to the flats, where, with the help of a canoe, I could reach the high bush cranberries which hung thick and red over the water of the sloughs. And I always brought back not only berries, but wild-flowers, which bloomed everywhere in brilliant masses.

The canoe and the exploration of the maze of channels and cross-channels afforded a pleasure to which new zest was always given, for there were ever fresh discoveries to be made until, with the coming of cool weather, the water went down. There was good fishing, too, on the river and its many channels and backwaters; and in the autumn the ducks were so numerous there that

 [*All Rights Reserved.*]

shooting them could hardly be called sport. In the foothills partridge and grouse were as plentiful; and higher up, among the crags and couloirs near the timber-line, lived mountain-goat. One could often see them, small white spots moving across a dark rock-face. They are keenly alert and swift, and can climb where no other living thing can follow. It is only a skilful sportsman who can bring them down. Occasionally one of the men of the household spent a Sunday up there, and, if he had good luck, brought a goat back with him; and then, if it was a young one, we had goat-cutlets for dinner. I learned to eat bear-steaks, too, that autumn.

II.

In the two miles to the school I passed but one house, from which three of my pupils came. Although the settlement was so small, the road which ran through it was two hundred miles long. A stage made a weekly journey throughout its length, from the railway at the upper end of the valley to another line which crossed it at its lower extremity. The passing of this heavy, swaying wagon, with its four horses, its bells, its mail-sacks, and its four or five passengers, was an outstanding event of the week.

There was always some traffic between the lumber-mills along the railway to the north and the logging-camps beyond us to the south, although most of the supplies for the camps were taken in by a steamboat which plied up and down the river during the summer months. There were some mines in the valley which were being operated, and a great many mineral-claims which were not, but upon which their locaters built high hopes; and there were always rumours of new and wonderful discoveries. Surveyors and prospectors passed along on horseback, with trains of pack-horses following, and an occasional lumber-jack went by on foot with his roll of blankets on his back. The settlers made fortnightly or monthly trips to the little town on the railway to the north, which was their market and supply centre.

Still, it was a rare thing to meet any one on my walks. Sometimes, at a turn, I would come upon a porcupine crossing the road. It would stop in its slow progress, stare at me with its little round eyes, its quills rising defensively, then roll clumsily on across the track to the shelter of the dense growth beside it. This curious creature, which, in spite of its forbidding appearance, is harmless, is protected by the Government of the country. There is a law against killing it, a provision made for the trapper, the explorer, or the timber-cruiser in the mountains who may get lost, lose his supplies, or by any mischance find himself in trackless forest or mountain solitude without food or gun. For him the porcupine is the only resource—it is the only edible animal he can kill without a gun. Its flesh is considered good food, and many a solitary *voyageur* whose canoe has capsized in a rapid, or prospector whose pack-horse has come to grief, has owed his life to it.

When the porcupine rolls himself up in a ball, with quills upright, he is practically proof against the attacks of any other animal. Wise old dogs are chary of him. Young ones have to acquire this wisdom through painful experience. But even a knowing one will sometimes, in a moment of excitement, forget the ways of this strange-looking, slow-moving denizen of the wilderness, and more than once I saw the dogs of the household in which I stayed come home grotesquely bewhiskered with the barbs, which was all they had brought off from an encounter in which 'Porcy' had had the best of it.

At one point along the way a spring gushed out from the bank and flashed across the road. Beside it was a birch-tree, on the smooth, white bark of which, at regular intervals along the trunk, were the deep marks of a bear's claws. The summer before, some one rounding the sharp bend in the road near it, with noiseless moccasined feet, had come upon a bear drinking at the spring, and the animal, in panic, had taken to the tree. Always, as I approached the spot, I half hoped, half feared that I might meet another. But if ever there was a bear there—which is likely enough—the sound of my footsteps reached its quick ears while I was still far off, and sent it to cover.

I never met, or even saw, a bear. But once in the late autumn one raided the farm pig-pen, and made a good supper off a fat pig that was about ready for the butcher. The settler guessed, and rightly, that the marauder would return the next night to make another meal off his kill, and was there to meet him when he came. He was a huge fellow, and his coat, which was in prime condition, compensated the farmer for the loss of his pig. It is only the common brown bear that comes down to the haunts of human beings, and it is comparatively harmless to meet, except when wounded, or a mother with cubs. The fierce grizzly keeps to the wilds, where only the sportsman, the trapper, or the prospector comes upon him.

III.

Toward the end of September, when the luxuriant vegetation of the flats and the hillsides was in its full opulence, and the thin, clear air was alive and vibrating with its fragrance, and when the colour which glorified everything was at its zenith, the days began to shorten. They were still full of golden sunshine and warmth, but the nights were colder. When, after rain then, the clouds lifted and the mountain-tops were again visible, one saw that the snow was a little lower on them. And gradually it slipped

down and down, covering up all the orange and terra-cotta of the cliffs and the ledges, until it met the trees. After that it was not long until it reached the road over which I walked to and from the school.

From the time the first fall turned the stumps into mammoth mushrooms and the boulders into miniature temples, and enwreathed with white garlands all the branches of the firs and the cedars, making each tree, while the sun was on it, look like a giant spangled Christmas-tree, I used snow-shoes, which made my walks a rare and exhilarating delight, instead of the hardship which they would otherwise have been at that season.

In many parts of Canada the snow-shoe has been adopted, like the toboggan and the ski, for what it contributes to winter sports. But in the mountains and in the north it is an article of utility, one of much importance to trappers and those whose work takes them away from beaten tracks. On snow-shoes one falls, of necessity, into a long, rhythmic stride, which carries one a long way without fatigue. Rough trails and untrodden places which were difficult to traverse at other seasons were made smooth when two or three feet of snow lay on them. Small stones and underbrush disappeared entirely, and stumps, logs, and even large boulders became merely softly rounded mounds. Fissures and gullies, almost impassable at other times, were but gentle hollows, and what in summer were sheer breaks or drops were turned into easy slopes.

Over all the soft white undulations I could tramp, up and down, mile after mile, without any sense of weariness. By avoiding the trees and keeping to the open stretches which had been swept bare by the avalanches of other years, I could go up over the foothills, high up on a shoulder of the mountain, and look down on an enchanted world. And, after I had learned how, I could sit down on the snow-shoes and descend to the valley in one long, dizzy, and joyous glissade. There was no wind in that valley, and the white fleece which covered it lay just as it fell. There was no smoke or dust to mar it, and each fresh layer made the landscape whiter only because it buried everything a little more deeply, and left less of the rocks and the trees exposed to view. It gave a curious sense, almost as of flying, to move freely and easily over the surface of a fresh fall. The snow-shoe is akin to the canoe, which was given us by the same race. It is to the snow what the light craft is to the water, and to encounter a snag or a submerged branch is almost as much to be dreaded with the one as with the other. To fall with snow-shoes on into fresh, light snow, is to find one's self in an almost helpless position.

Tramping over the silent foothills when they were overlaid with their thick winter covering, you came on many curious trails, which ran in all directions and crossed and recrossed in strange, unaccountable ways. These were the tracks of the wild things, big and little, from the coyote to the tiny snow-bird, which had been made, no doubt, in the search for food. One wondered where they all lived, and how they subsisted, when the ground lay so far below and the nights were so cold.

Once when, on the way home from the school, I was taking a short cut across one of the frozen sloughs, on which the snow lay deep but firm, a big coyote came out from the bushes at one side, and crossed the open space just in front of me. He trotted leisurely, and regarded me with contempt, noting, with the sagacity of his kind, that I had no gun. These prairie wolves are of savage aspect, but, like others of their race, derive courage only from numbers. This one had a fine, thick, yellowish-gray coat. I wish I had it now to help to keep out the dampness of this London atmosphere, which is so much 'colder' than anything I ever experienced during that clear, sparkling winter in those mountains.

Sometimes, on a winter night, a band of these wolves, which are the greatest foes of pioneer settlers because of their depredations on young stock, would come down to the edge of the clearing, which was close to one side of the house, and rend the white stillness with a weird and appalling chorus of cries that echoed far up and down the valley, and back and forth from range to range—the most unearthly and most disturbing sound to which I have ever listened. The first time my senses were assailed by those demoniac wails and lamentations I believed there must have been at least a hundred in the pack, but five or six can wake the shuddering echoes of a whole mountain-side, and turn a calm and peaceful valley into an inferno of discord.

The coyote has a cunning which is uncanny and diabolical, as every man who has tried to hunt it knows, and as many a good dog has learned to his cost. Two or three of them will suffer themselves to be chased by a dog, beguiling him across a lonely prairie or along a wild valley until he is far from his home and friends, when they will suddenly turn on him. It is a common thing to see a dog that set out bravely as the pursuer come back ignominiously as the pursued, crawling up to the camp or the cabin, always exhausted, and sometimes severely wounded; and many a trapper or prospector has waited in vain for the return from such a chase of his camp-fire comrade. The big yellow coyote that crossed my path on the slough was the only one that afforded me a close view of his species, but I saw many of them that winter prowling in and out of the brush on the flats. The cold weather made them bold.

IV.

The twelve children whom I taught came from four households. Three of the families

were Swedes. Until I came to open the little school they had not known a word of English, and I could not have believed that in the whole world there were children so eager to learn as they were. The other was a family of four, a boy of fourteen and three girls of twelve, ten, and eight, who had been born at a trading-post far from civilisation. Up till that time, what little instruction they had received had been given them at home, and to have a school and a teacher was the most wonderful and beautiful thing that had ever happened to them.

They were always there ahead of time in the morning, and would come flocking down the road to meet me, and to tell me about the flying squirrel they had seen when going home the night before, or the cougar's tracks they had come across that morning. They knew the habits and haunts of everything in feathers and fur which lived in the valley and the mountains which enclosed it, and I think they must often have been puzzled at my lack of understanding of these matters, careful as I was to conceal it. For when I first came to them they had greeted me as a superwoman; and even to the last day I was with them, although I know I must many times have betrayed my ignorance of the natural history of the region, they regarded me as one who understood all mysteries and had all knowledge.

They could show me the nearest eagle's nest, and tell me how many young eaglets were in it. One of them had a pet mink that she had found orphaned and half-dead in its babyhood, and had resuscitated and reared. The ways of teal and mallard were simple to them, and they knew at just what time in the spring one could cut a hole in the ice on the river and snare trout. One Saturday afternoon, when I was climbing over the foothills, I met the boy and the eldest girl coming down, carrying on their shoulders on a pole between them a mountain-goat which they had shot up near the timber-line. They put their burden down and rested while they told me of their expedition, speaking of their trophy, of which any sportsman would have been proud, as casually as if it had been a rabbit or a musk-rat they had bagged.

On the chance of winging a grouse or a partridge on the way, they carried their rifles to and from the school, and stacked them in one corner of the room—a practice to which I found it rather hard to adapt myself. During the noon recess they sat on the logs and stumps in the little open space about the building, and coaxed the marmots and the gophers and other little wild things of the wood to come out and take bits of food from their hands, or cajoled the gorgeous blue jays and the brilliant whisky-jacks to perch on their heads. Their offerings to me were not the fruit and flowers which children in ordinary Canadian schools are wont to heap upon the desks of their teachers. They brought me a grizzly bear's claw, a hawk's egg, the feathers from an eagle's wing, a stone hatchet they had found on what was believed to be the site of an ancient Indian camping-ground, a bit of ore from an outcrop they had discovered somewhere on the face of the mountain, and curious formations from fossil-beds in a cañon some miles down the valley.

V.

It was only twelve years ago that I taught those children in that pioneer school, but a railway runs through that valley now. I travelled over it last summer. Down on the flats there was the same maze of gleaming silver and vivid green, woven and interwoven. The snow-crowned summits shone like spires and domes of gold, and the cataracts boiled and plunged down the twilight depths of the gorges. The forests on the lower slopes were as mighty, the walls above them as stupendous, and over the whole was the same glory of colour, shifting and changing every moment.

But the log-cabins of the four homesteads I had known had disappeared, and in their places were bungalows with vine-hung verandas, and flower-bordered walks leading down to the gates; while all along the route were new cabins, some obviously built that season, and others standing in clearings whose extent indicated a homestead of earlier date. I watched eagerly for the little log-school which had stood in the shadow of the tall fir-trees. It was gone, and I could scarcely recognise the place where it had been. On its site was a larger and more modern building. It was painted white, and had grounds which were enclosed by a board fence. It was during the noon-hour that my train passed, and from it I could see children moving about the yard. But I knew that they were just like the children of any other school in western Canada, and that they were not inviting the marmots or the blue jays. They probably had a garden, and lessons in 'nature-study'; and there were no guns stacked in a corner of the schoolroom.

The forest had been pushed back to the foothills, and in some places even the 'benches' (terraces) above them were under cultivation. There was a station not far away, and a post-office. I saw motor-cars speeding up and down the road on which formerly there had been only pack-trains, the wagons of the settlers, and the stage, whose weekly passage had been of so much importance. It had gone with the coming of the railway. So had the steamboat which had plied up and down the river. The logs still floated down on the swift current of the main channel on their way to the mills, but the train on which I travelled was carrying supplies to the logging-camps and the mines. That valley is no longer remote from civilisation, and the schools in it are much like those in any other part of the country, except that all have not unrolled before their doors a panorama of such splendour.

But there are still such schools as the one I had the high privilege of knowing. There are many silent valleys beyond the Rockies into which the pioneer is finding his way, and where the logs are being hewn for the humble walls within which a little group of children will gather to look up at a teacher with worshipful eyes. There one who loves the camp-fire and the canoe, who quickens to the cadence of the waterfall or the thunder of the avalanche, whose spirit vibrates to the elemental forces of the deep solitudes, can know, what can never be put into words, the spell of the Last Great West.

THE MYSTERY OF THE *WELL MET.*

CHAPTER III.—AN ERROR IN NAVIGATION.

THE meal which a moment or two later Mr Drew carried into the forecastle consisted of that sailor's treat, tinned salmon, with a plentiful supply of very hot, strong tea, and Hervey did it more than ample justice, at the same time thinking to himself that, while these people were undoubtedly a singularly unprepossessing set, they were treating him with kindness and liberality.

As he ate he asked a few questions, but without receiving in reply much further information; and, on his side, he gave a slightly fuller account of his own adventures. The golden-hearted Jacques and his admiring comrade, Sylvestre, had gone on deck for their watch; but Wilson and Drew remained with him, and, grateful as he was and well aware that he owed them his life, yet somehow he could not quite overcome the shuddering dislike which both—Wilson in especial—inspired in him.

Another thing he noticed as a little curious was that both Wilson and Drew seemed to speak French with great fluency and apparently as naturally as English, as though they had been long accustomed to employ it in place of their native tongue. Naturally there are many English and Americans who speak French fluently and readily, but it struck Hervey as a curious coincidence that, of the four men on board the schooner, two were French, and two spoke the language as easily as if it were their mother-tongue.

Though he listened intently, Hervey did not hear again that voice he had taken to be a woman's, nor did he detect any other sign of her existence; so presently he came to suppose that he must have been mistaken, and that perhaps he had really been a little light-headed.

After he had finished his meal and had been provided with a cigar, which he appreciated almost as much as he had done the food and drink they had given him, he asked a few questions about the working of the ship and how they had been managing, and Wilson went away, and brought him the chart on which their course was marked. Hervey also asked for the log, and was shocked to the depths of his sailor-soul on finding that none was being kept.

'But there must be one; the captain must have kept it before he died,' Hervey almost wailed, for to him a ship without a log was like a house without a roof.

Both Wilson and Drew protested entire ignorance. The late captain might have kept one—they knew nothing about it. After his death a good many of his personal belongings had been thrown overboard for fear of infection, and possibly the log had gone with them. If not, it might be in his cabin. But everything aft had been locked up, and none of them cared to go there for fear of catching the disease that had carried off so many of their shipmates. Wilson was very emphatic in declaring that he would neither go aft himself nor allow any one else to do so. 'Had enough cholera,' he said. 'Don't want the whole business to start again.'

Hervey thought his fears exaggerated, but all the same shared them to some degree, and made no attempt to insist on penetrating aft. There might still be danger of infection for all he knew, and there was no sense in running useless risks. But he would not rest satisfied till he had secured an old exercise-book, wherein he at once started a new log, putting at the beginning a brief statement of recent events as described by Wilson. This he insisted on having signed by Wilson himself, Drew, and the Frenchmen.

'Must have things ship-shape,' he said, 'and a ship without proper papers is like a married woman without her wedding-lines.'

'I'm sure it's a great comfort for us to have some one who knows what ought to be done,' remarked Wilson smoothly. 'Can you show us now our exact position, and if I've got it correctly marked on the chart?'

'You must wait till noon to-morrow,' answered Hervey; 'I can work it out then. I hope you didn't chuck the sextant and the chronometer overboard as well as the log?'

However, Wilson was able to produce these at once, together with a copy of the *Nautical Almanac;* but as the night, though only a light breeze blew, was too cloudy for observation, there was no possibility of discovering their position before noon next day. Hervey went on deck for a short time to look round, but he was still weak, and began to feel very exhausted. He did not stay long, going back to his bunk in the forecastle after a look at the glass had assured

him that the present favourable weather was likely to continue.

It appeared that all four men used the forecastle now, apparently fearing that in the cabins aft infection might still linger. Hervey thought this natural enough, and, indeed, fully shared their feelings on the point, for he would a good deal rather have gone through a hurricane or two at sea than expose himself unnecessarily to infection, especially when the infection to be feared was that of the dread cholera. He made up his mind to avoid the cabins aft as carefully as did the rest of them, though it struck him as he lay down in his bunk that the fears of these men had not availed to stop them from looting their late captain's sea-chest.

'For if these fellows, the whole lot of them,' he said to himself, 'aren't wearing his shore-going togs, I miss my guess. Of course, one can understand two rascally deck-hands like the two Frenchies doing a bit of looting, though they ought to be kicked for it; but I should have thought a passenger like Wilson or a chap like Drew, with an interest in the cargo, ought to be above that sort of thing. And it's a wonder they have the cheek to wear them before me. They must know I'm sure to suspect something.'

Indeed, the fact that Wilson should either have allowed the two men to appropriate their late captain's clothes or have joined in the theft himself seemed very strange; but, then, the whole of this affair seemed in many ways so strange and unusual that Hervey really did not know in the least what to think of it.

'Anyhow, I've nothing to complain of so far,' he thought, as he tried to compose himself for sleep; and when he fell into a troubled doze, it was to dream of the golden-hearted Jacques, who, he thought, came into the forecastle carrying a huge urn of coffee, which he stabbed with his knife in many places, so that the coffee spurted out and made puddles on the floor, which Hervey toiled in vain to mop up.

He woke suddenly and with a start, to find Jacques himself bending over him and staring at him very fixedly, in a manner that seemed neither pleasant nor friendly.

'Sleep you always with your throat so bare and open?' Jacques asked in a mumbling tone.

'What's that got to do with you? Take your ugly face out of here,' exclaimed Hervey angrily; and Jacques slunk away, muttering something to himself.

Afterwards Hervey slept better, and he woke in the morning much refreshed and feeling a great deal stronger. He was given an excellent breakfast, with more tinned salmon and very strong black tea, and he enjoyed it thoroughly.

When he had finished he went on deck, and found the schooner running very nicely beneath a fair spread of canvas. But the decks were untidy, rope-ends were flapping, tackle was not stowed properly away, and indeed the whole aspect of the little ship was one well calculated to grieve his sailor-heart. When he tried to put things right he made at once two discoveries: first, that his crew of four, one and all, displayed an inconceivable clumsiness, as though utterly unused to sea ways; and, secondly, that they were by no means disposed to obey his orders. The good Jacques, indeed, scowled and fingered his knife in a very threatening manner, and his companion, Sylvestre, discovered a talent for the employment of such foul and offensive language that only his swift retreat into the forecastle saved him from being kicked into it by the indignant Hervey. And Mr Drew took their part so vehemently that Wilson, who had gone below for a moment, reappeared in a great hurry.

'Shut up, you fool!' he shouted to Drew with an angry oath. 'Mr Drake, what's the matter? What's been happening?'

'Why, I told those two rapscallions to help me stow those ropes away properly,' answered Hervey, 'and one of them got his knife out, and the other started to use language I'll take from no man.'

'Oh, I'll soon put that right,' answered Wilson, and saying something to Jacques in French, disappeared with him into the forecastle. In a minute or two he came on deck again. 'I've given them a bit of a talking to, Mr Drake,' he said, 'and they've promised to obey orders for the future; but you must remember we have no claim on them. They regard themselves as quite independent. You see, I'm only a passenger, Mr Drew has only to do with the cargo, and you are a castaway we have picked up. We can only get on by agreement. They have the whip-hand of us, and they know it, and there can be no question of ordinary discipline. We must simply rub along as best we can. I'm sure you will understand that, Mr Drake.'

'Oh, all right,' growled Hervey. 'When I want to shorten sail, for instance, I suppose I'm to call a meeting of all hands, and if they agree, then a committee will be appointed to do it—by which time the sticks may be blown out of her.'

'I hope it won't be so bad as that,' answered Wilson, with his singular and somewhat terrifying smile. 'I hope we shall get on all right. Only, we must remember we have no right to give orders in the ordinary way. You know we can't afford to quarrel with these two men. We are short-handed enough as it is.'

That was true enough, and Hervey made no reply. A little later Jacques and Sylvestre came on deck, and though it almost made him choke with indignation to see them lounging about so lazily while there was so much that wanted doing, he made no further attempt to set them to work.

It was nearly noon now, and Hervey began his preparations for ascertaining the ship's position. The others looked on very anxiously and with some excitement. The result he

secured was so surprising that he checked it before saying anything.

'Well,' he told them at last, 'you are hopelessly out of your course.' He laid a finger on the chart. 'This is where you are,' he said, 'not there at all. You are not making for Manilla; you 're heading straight for Australia.'

To his surprise, this announcement of his did not seem to cause much astonishment. They looked at each other gloomily, but no one said anything. It was almost as if they had anticipated something of the sort; and Hervey noticed too that, though Wilson had declared himself responsible for the course laid, no one seemed inclined to blame him.

'What puzzles me'—— began Hervey, and paused, not quite knowing what to say.

As a matter of fact, the whole affair puzzled him enormously. He could understand an error in navigation; he could understand total ignorance of it; but he could not understand how it was the schooner's course had been marked out so confidently, and yet so utterly wrongly. It was almost as though Wilson had been taking them astray on purpose; and yet for that he did not seem to have enough knowledge, nor did the others appear to suspect him of it. Nor, for that matter, could Hervey imagine any motive for his doing such a thing.

'This is our exact position, then,' Wilson asked; 'and we must lay our course here?'

Hervey would have much liked to pack Jacques and Sylvestre off about their business before answering these questions, for by the immemorial tradition of the sea the ship's position is solely the concern of the ship's officers, and is a point on which the crew is never given any information. But he had provoked one storm already, and knew another had better be avoided, and so, as briefly as he could, he explained their position, and how their course must be altered to take them to Manilla.

'Though how you came to lay such a straight, workman-like course, and yet be so hopelessly wrong, I can't imagine,' he said to Wilson.

'I suppose I worked chiefly by faith,' answered Wilson, with that sinister and evil smile of his. 'I shall trust faith no longer. Indeed, I shall make a point of settling accounts with faith later on.'

To this remark Hervey could not attach much meaning; but it seemed to amuse the others vastly in a dark, saturnine way, and Jacques began again his abominable trick of fingering his knife, as though he only waited the chance to stab faith in the back.

CHAPTER IV.—A WOMAN'S HANDKERCHIEF.

THE course was duly changed, and as, fortunately, the weather remained calm and fine, the working of the schooner presented few difficulties.

Hervey's new shipmates appeared to be at considerable pains to make themselves as agreeable as possible to him, and to give him no cause for complaint against them; but he, on his side, found it quite impossible to overcome his dislike and distrust of them. Towards Wilson in especial he still experienced the instinctive shuddering abhorrence he had felt for him from the first. Jacques and Sylvestre appeared comparatively ordinary ruffians—Jacques the more brutal and violent, and Sylvestre the more dangerous. Drew struck Hervey as being, on the whole, the least repulsive of the four; but he was very sure that he would not care to trust Drew very far or confide either purse or life to his keeping.

Still, the personal character of his shipmates was no concern of his; and, after all, they had saved his life, treated him well enough, and were now helping him to reach a port whence he could secure a passage home. And he was thankful that his services in navigating the schooner seemed to be valuable enough to set off against his rescue, so that he need not feel under too great an obligation to them. He was also thankful that he had nothing of value in his possession, nothing indeed but the clothes he stood up in, since he was very strongly of opinion that these shipmates of his were little likely to resist any temptation that came their way.

One thing he had insisted on was that regular watches should be kept; and though Jacques and Sylvestre objected strongly, since anything regular they both disliked exceedingly, he was supported by Wilson and carried his point, the two Frenchmen and Wilson and Drew forming the two watches. Hervey himself, who by a sort of common understanding was now acting as captain—though a captain never sure that his orders would be obeyed—did not keep a regular watch, but was continually on the look-out, seeing that the right course was kept by the man at the wheel, and ready for any change in the weather. As a rule he got most of his sleep during the day, and he noticed that whenever he retired to the forecastle for needed rest, either Jacques or Sylvestre invariably came and hung about near by.

What the motive was for this he could not imagine, but it seemed as if they wished to make sure that he did not come on deck unexpectedly. He noticed also that when he did wake and show signs of stirring, whoever was on watch almost always slipped away to give warning. It was almost as though they feared being taken by surprise by him, and he wondered if they suspected him of entertaining any idea of attacking them and seizing the ship.

'But, then, there are four of them, and why should they be afraid of one man?' he asked himself. 'It 's a queer business altogether, and I shall be jolly glad when we reach Manilla.'

That day had been one of light and shifting winds, so that they made little progress. In the afternoon the wind failed altogether, and Hervey went below to take his rest earlier than usual, telling the others to call him if there was any sign of a change in the weather. He was tired, for he had been up most of the night, and that morning had carried out some necessary changes in the rigging single-handed, so he fell asleep almost at once, only to be wakened an hour later by Drew, who was shaking him violently.

'You had better come on deck,' Drew said. 'Wilson thinks it's going to blow. You sleep soundly,' he added with a laugh. 'I thought you would never wake.'

'I want it; I got no sleep last night,' answered Hervey, and went on deck.

Heavy clouds were gathering in the north, but the glass was still steady, and he did not think that any precaution was necessary, or that the bank of clouds meant much. He told Wilson, who was at the wheel, that there was nothing to be alarmed at, and was turning away to go below again, when he noticed something lying near his foot. He stooped and picked it up, and, to his amazement, saw that it was a lady's handkerchief, a small square of cambric bordered with lace, and quite fresh and clean, as though it had only recently been dropped.

'Good Lord!' he said; 'where on earth does this come from?'

'What?' asked Wilson; and when he saw the handkerchief Hervey was holding, his look grew so dark and menacing that instinctively Hervey stepped back, ready for attack.

'Whom does this belong to?' the mate asked sharply. 'Who dropped this?'

'It's mine. I must have dropped it,' answered Wilson, appearing to recover himself, and exchanging his scowl for his more ominous and dreadful smile. 'A little souvenir, that is all. I do not know how I came to drop it, but I'm much obliged to you for picking it up. I have carried it in my pocket for years. I should have been sorry to lose it.'

'It doesn't look as though it had been in any one's pocket for years,' remarked Hervey doubtfully.

'Ah, you are observant; it is because you are a sailor,' answered Wilson smilingly. 'It is a great gift to be observant, and may take a man far. I have carried it always in my pocket-book.'

He held out his hand as he spoke, and Hervey gave the handkerchief to him, though with some reluctance, for there came into his mind a memory of how once he had thought he heard on board this ship a woman's voice.

Yet it seemed impossible, inconceivable, that there could be a woman on board. How could her presence be concealed, and why should it be? He saw that Wilson was still looking at him with his menacing and evil smile.

'You are thinking?' Wilson hinted gently.

'Why not?' Hervey retorted. 'A man's thoughts are his own.'

'But he confides them to his friends,' suggested Wilson.

'So he does,' agreed Hervey. 'For example, what are you thinking about?'

'I was thinking,' answered Wilson with a great appearance of candour, 'that perhaps you could tell us now when we might hope to reach Manilla.'

'Depends on the wind,' answered Hervey; and he noticed that the handkerchief which Wilson professed to have treasured for years with such care he was now thrusting indifferently into his trousers-pocket. 'A good breeze might get us there in forty-eight hours.'

'That is good hearing,' said Wilson. 'I know where there is a case of good brandy. We must open it and drink each other's health when we sight land.'

'Not till we are in port,' retorted Hervey. 'Many a ship's been lost in sight of land.'

'No doubt you are wise to take every precaution,' remarked Wilson.

He said no more, and Hervey went down to resume his interrupted slumbers. Finding Sylvestre in the forecastle, he grumbled to him very angrily at the needless way in which he had been disturbed.

'I'm near dead for a sleep,' he complained. 'I hope to goodness they'll let me alone this time unless it's something really serious. I feel as if I could sleep till to-morrow, and if you or any one else turns me out without good reason I'll break your head. I must get a sleep sometimes or I shall go dotty.'

Still grumbling, he lay down in his bunk, and to all appearance fell asleep instantly. But in reality, though his eyes were closed, he was wide awake, listening for the slightest sound, every nerve and sense intent. For this incident of the handkerchief he had found on deck had disturbed him greatly, and he believed no word of what Wilson had said in explanation.

In vain he tried to persuade himself that it was impossible a woman could be on board without his knowing it; that the handkerchief could be accounted for in a dozen different ways; that when he had thought he heard a woman's voice he had been half out of his mind with exhaustion and fatigue. In spite of all, Hervey found himself convinced that there was about this ship a deeper and a grimmer mystery than he had before suspected.

For two hours he lay thus motionless, and for two hours Sylvestre lounged and smoked by the forecastle door. Presently the Frenchman began to yawn, as if growing sleepy himself; then he came inside and looked at Hervey, who never stirred, and continued to breathe deeply and regularly.

Sylvestre yawned again, as though he would like to sleep himself, and then went back and settled himself in a half-sitting, half-reclining position at the forecastle entrance. Hervey ventured a peep at him. His eyes were closing, and he nodded. His head slipped, and he woke with a start and a curse, looked at Hervey, and seemed to be reassured when he saw that he did not stir. Sylvestre lay down then at full length across the threshold of the forecastle and closed his eyes. For a time Hervey waited, and then he sat up. Sylvestre never stirred as Hervey stood upright, and on bare feet stepped cautiously up to him, and across his recumbent body out of the forecastle.

With equal caution Hervey crept on up the hatchway and glanced along the deck. Wilson was still at the wheel. Drew was sitting smoking near by—and that was all.

Oddly disappointed, though what he had expected to see he did not quite know, Hervey went quietly back to his bunk, stepping again across the still soundly sleeping Sylvestre.

'Yet it seems as if there must be something they want to keep from me,' he said to himself, 'or why is Sylvestre put to watch like this? Or is that merely a matter of general precaution, because they are such blackguards themselves they can't trust any one else?'

He began to think this last must be the real explanation, and when he lay down again he fell asleep almost at once. But his slumber was not very deep, and only a short time later he was awakened by hearing Sylvestre's voice saying sullenly, 'He sleeps like the dead. He has never moved, not once. I have watched him all the time, and if my eyes were closed now, that was only on account of my fatigue, not that I slept. Regard him for yourself, how he slumbers there.'

Fortunately Hervey had made no sign when he wakened. He heard some one—he could not be sure who it was—cross the forecastle to look at him, and then apparently retire satisfied. A little longer Hervey lay quiet, and when at last he ventured a peep he saw that Sylvestre had once more composed himself to slumber. Yet another space Hervey waited, and when he was sure that Sylvestre's slumbers were profound, he rose from his bunk and on his bare feet went silently down the forecastle, again stepped across the sleeper on the threshold, and went on up the hatchway.

It was late now, and when Hervey raised his head above the hatchway the sun was near to setting. Its slanting rays fell right across the schooner, and bathed in their crimson light the tall, slim, upright figure of a girl, who stood near the wheel, her face beautiful and rigid and as pale as death.

(*Continued on page 310.*)

SHOE-LEATHER FROM THE SEA.

LEATHER is still remarkably scarce and—like food-stuffs and most other commodities—remarkably dear!

The war simply staggered the leather trade with the prodigious demands which it made upon its resources. Nothing, indeed, in the way of army supplies was more extraordinary (with the exception of the output of munitions) than the enormous quantities of boots which were made in this country for the troops of the Allied forces.

Output records of a truly amazing nature were established in order to cope with the never-ceasing call for boots, millions of boots, and still more millions, for our fighting-men. Never before in the history of the world was the boot-and-shoe trade taxed to such an almost incredible extent to keep pace with the countless contracts for the footgear not only of Tommy and Jack, but for the Belgian, Serbian, French, Russian, and Italian forces; besides boots for the Italian Red Cross, bluchers for Gurkhas, sandals for Indians, airmen's boots, gunpowder-boots, and every variety of boots and shoes needed in warfare one can possibly imagine. Only those privileged to get a peep behind the scenes had the slightest conception of the stupendous nature of the task with which the horny-handed sons of St Crispin were confronted.

But 'the trade' rose to the occasion as one man—even although it did mean that British factories for months were running 'all out.'

Picture what the foregoing meant in the way of using up leather! And that wasn't all. In addition to the tens of millions of soldiers and sailors that had to be shod, thousands of airmen's suits had to be made, almost entirely composed of leather; millions of leather belts, pouches, rifle-slings, and scabbards; leather saddles and sets of harness by the hundred thousand.

Leather, it will thus be seen, played a big part in the successful carrying on and winning of the war.

This unprecedented demand on the world's leather-supplies could only, of course, result in one thing—a world-wide scarcity of raw material. Curiously enough, prescient men in the trade tell us that a big leather shortage was inevitable in any case—war or no war; that a world cataclysm like the Great War merely precipitated the crisis. It did with a vengeance!

In any case, the existing leather scarcity is going to be a tremendous handicap to the boot-

and-shoe business everywhere, and to the community, who will eventually have to 'pay the piper'—unless new sources of leather-supply can be tapped immediately.

The most important available sources at present are the ox and the sheep; but the hide or the skin of practically any creature can be made into leather. Hides are skins of oxen, horses, and all the larger animals; skins are derived from sheep, goats, and the smaller quadrupeds. The skins of sharks and cobras, or the hides of the dainty deer and the ponderous elephant, may be converted into footgear and leather for other purposes.

Thus the hide-store of a large tannery is frequently a zoological museum of skins—skins and hides from all sorts and sizes of creatures in the animal world—illustrating in tangible and picturesque fashion the truth of the old saying that 'there 's nothing like leather.'

It is not surprising that experiments on a big scale have recently been made to tap fresh sources of leather-supplies for the use of the shoemaker, the saddler, and the fancy leather goods manufacturer.

The shark and certain big sea mammals, apparently, are going to stock the shoemaker's shop soon—that, in a sentence, is the net outcome of the numerous experiments that have been made. Shoes from the shark have, in fact, gone beyond the experimental stage; they are into the range of 'practical politics.'

It is now two or three years since the matter was first taken up by the United States Government, following on the experiments and research-work of Mr Alfred Ehrenreich, who, after graduating in medicine, turned to banking, and for the last ten years or so has devoted all his leisure time to studying at close quarters the habits of sharks, porpoises, and other large inhabitants of the sea. Mr Ehrenreich became an authority on the subject, and was probably better qualified than any other living man to lead the way in utilising the skins of these deep-sea dwellers, not as a substitute for leather, but as an addition to the world's existing supplies.

How Mr Ehrenreich, with the assistance of a clever Danish chemist, succeeded in doing this is one of the most remarkable romances of research and enterprise ever chronicled.

Orthodox tanning methods were a failure—completely; but the science of the chemist solved the problem, and marine leather can now be tanned as successfully as ordinary leather. Not only so, but it is claimed to be every bit as good as the commodity with which we are all familiar. It is soft and pliable and durable, and considering that nature fitted the shark to live in the sea, his skin should be water-tight. And skilfully dressed, in addition to boots and shoes, this new fish-leather works beautifully into belts, hand-bags, card-cases, furniture-coverings, and even gloves. It takes a nice finish, being finely marked with a rather peculiar grain.

The hide of one shark produces from twelve to forty square feet of leather, according to the size of the animal; the skin of a devil-fish will often cover an area of fifty to a hundred square feet. And the supply of this new sea-leather is practically an unlimited one. From Alaska alone, in the early days of the enterprise, eleven thousand pounds of sharks' skins were exported in one month.

To-day a 'bag' of ten thousand fish daily is a not uncommon occurrence, which will give one an idea of the immense nature of this unique industry which is converting the skins of sea-animals into leather for all sorts of useful purposes. Sharks, porpoises, devil-fish, black-fish, beluga, sword-fish, and even dog-fish can all be utilised to add materially to the world's supply of leather. And there will be no need to institute a 'close season' for these animals, for the waters of the Mexican Gulf and the Gulf Stream, the Pacific Ocean, and the seas washing the Australian continent simply swarm with them.

Enterprise is written large over the whole concern, which, by the way, trades under the appropriate designation of the Ocean Leather Company. About two years ago a tannery and four fishing-stations, with all the necessary equipment for catching and landing the fish, were established—two stations each off the coast of Florida and North Carolina respectively. The tremendous possibilities of the business, and the unbounded confidence of the promoters, may be understood from the significant fact that orders have been placed for plant and equipment to enable forty stations to be brought into operation along the far-flung American seaboard.

And the story is only partly told. In itself the production of a good, serviceable quality of leather from the skins of the shark and other sea-denizens is a really great achievement—a big scientific and commercial triumph; but when a whole host of valuable by-products are added, it becomes even more wonderful and extraordinary.

Practically nothing is lost in this newly tapped industry—the blood, the oil, the stomach, the membranes, the teeth, and the fins all being utilised for some commercial purpose or other, and at considerable financial gain to the pioneers of what may eventually prove an ocean Klondike. The fins of the shark are eagerly bought up by Chinese restaurant-keepers at ten shillings each, shark-fin soup being a special delicacy with gourmets of the Celestial race; the rapacious-looking teeth are turned into necklaces; the blood into one of the finest of waterproof glues; the membranes and the intestines are made into gloves, glue, and gut; the oil makes a valued article of commerce; while the flesh is turned into an admirable chicken-food and fertiliser. A peculiarly rich quality of oil from the jaw of the

porpoise brings no less than ten pounds per gallon; as a lubricant for watches and mechanical work of a delicate nature it is said to be unrivalled.

Altogether a wide range of serviceable articles, you will agree, garnered from a source that has hitherto been untouched for the purposes specified.

Indeed, when the wonderful story of this remarkable enterprise is told in its entirety, it will, we are certain, be acknowledged to be one of the most amazing and extraordinary in the whole realm of industrial exploitation, opening up new avenues of business and adventure more strange and startling than anything even in the romantic visions of fiction. The striking success already achieved—and only the fringe of the business has been touched—is a notable tribute to the inflexible determination, the characteristic commercial enterprise and acumen, and the painstaking, ingenious chemical research of our American cousins.

THE NEW BALTIC STATES.

II.—LATVIA.

By Robert Machray.

I.

PHILATELY is highly educative, and stamp-collectors were probably among the first people in the United Kingdom to know anything very definite about the new Baltic States, which had to have postage-stamps of their own as soon as possible, not so much as betokening their independence as from sheer necessity, for neither Russian nor German stamps could be used. If not one of the rarest, one of the most curious of these Baltic postage-stamps was a stamp issued about two years ago at Riga; it is no longer current, and good specimens will likely be worth a great deal of money some day. In shape a largish oblong, it was printed in greenish-blue and light brown. On its front was 'Latwija' and 'rub 1 rub' (one rouble), the latter being placed under a symbolical design of a mother and children. It was a pretty, if an unusual-looking, stamp. But it was the back of the stamp which attracted keen attention, for on a green ground there were lithographed words and figures that inevitably suggested German paper-money.

This stamp has a strange historic significance such as is possessed by no other in the world. It is safe to say that it is a unique stamp. Latwija, which is the local form of Latvia, is the name of the Baltic republic which has been established by the Letts, and which was at first generally called Lettland. The Germans held part of Latvia until well into November 1919, and towards the end of the occupation they printed and emitted a sort of bank-note (*kassenschein*) for ten marks, which was forced on the people within their power. The back of this note was plain. The Letts, in the end victorious over the Germans, captured large quantities of these notes, and, themselves being short of suitable paper, hit on the idea of utilising the backs of the notes, did what printing was necessary, cut the material to the requisite size, and turned them into postage-stamps. Of course, the paper-money was of no value once the Germans had left the country, and this story is eloquent of the clever way the Letts overcame the great difficulties which confronted them when fighting for their freedom.

As a geographical term Latvia is new to most of us. It is one, however, that apparently has come to stay, though the term Lettland is still much used, and everybody would have known what that word meant—the land of the Letts. The Letts themselves call their country Latvia, and this is definitive. Latvia is bounded on the north by Esthonia, on the east by Russia, on the south by Lithuania, and on the west by the Baltic. In the article on Esthonia* reference was made to the assignment to that state of the northern part of the old Baltic province of Livonia by the Russian Provisional Government of Prince Lvoff in the early days of the Revolution of 1917. The frontier between Latvia and Esthonia is that which was drawn at that time. There was a dispute whether the town of Valk or Walk, which is on the border and has a mixed population, belonged to Esthonia or to Latvia; but in 1920 a Commission, over which a British officer presided, gave it to Esthonia, as the majority of its inhabitants are Esthonians. The northern frontier of Latvia lies above four of the districts of old Livonia, and this area is usually designated Southern Livonia. In addition to this territory, which is very important because it contains the great port of Riga, Latvia consists of the whole of Courland and of an eastern region known as Latgale or Latgallia, comprising three districts formerly included in the Russian province or 'government' of Vitebsk.

II.

All this stretch of country, which has an area of about 25,000 square miles, is peopled predominantly by the Letts, who are of Aryan origin, having come from Asia and settled on the

* See *Chambers's Journal* for March 1921.

shores of the Baltic some four thousand years ago. They are different in race from their neighbours the Esthonians, but are of close kin to the Lithuanians, with whom they may some day form a political alliance. Professor Ian Ozolin, a distinguished Lettish writer, asserts that the Letts constitute the 'oldest European nation,' and declares that their language, mythology, and folklore still adumbrate the speech, religion, customs, and practices of the remote ancestors of Europe. This is supported by Professor Meillet, of the Collège de France, who says: 'If you wish to hear from human lips some echo of what the language originally common to Indo-Europeans may have been, go and listen to Lithuanian peasants talking'—which is equally true of the Letts. The differences that now exist in the language and the customs of the Letts and the Lithuanians arose out of the diverse political history of the two peoples. Lettish resembles Lithuanian very much as Portuguese resembles Spanish. The Lettish-Lithuanian tongues are older than any other in Europe—older than Latin or ancient Greek, and exhibit a greater affinity to the ancient Sanskrit of India than to the languages of the peoples in the immediate vicinity of Latvia and Lithuania.

As with Esthonia, the early history of Latvia is obscure; much of its later history is bound up with that of its northern neighbour. Up till seven hundred years ago the Letts were a free people, ruled over by their chiefs in tribal communities. Early in the thirteenth century their territory was invaded by the Germanic Order of the Sword, which was afterwards merged with the Teutonic Knights, who, not without a long and bitter struggle, conquered the Baltic lands, and formed a state out of Courland, Latgale, Livonia, and Esthonia, which lasted till 1560. During this period the Letts, like the Livs of Livonia and the Esthonians, were deprived of their lands and civil rights by the Germans, who divided up the country into estates, some of which were extensive. The Letts became German serfs, but never were really Germanised, and always hoped to recover their freedom. The 'Baltic Barons' and Junkers of Southern Livonia and Courland are the descendants of these German invaders, and, as will be seen, a great part of Latvia's fight for independence was concerned with these gentry. Far more even than Esthonia, Latvia had to contend with her German oppressors; nor was the contest closed till near the end of 1919, and only after the most arduous efforts.

With the overthrow of the Order of the Teutonic Knights, Livonia and Latgale passed under the rule of Lithuania, which was then united with Poland; while Courland, which retained its German nobility and a degree of independence, became a vassal duchy of Lithuania-Poland. But the country suffered because of the numerous wars of the seventeenth century, and in 1621 Livonia was annexed to Sweden. Some ninety years later Livonia was conquered by Russia. After the first division of Poland, Latgale passed to Russia, and in 1795 Courland joined Russia. From that date up to 1918 all Latvia was a part of Russia. During the Swedish period the Letts of Livonia enjoyed a certain amount of freedom from the oppression of their German masters, but under Russian rule they and their brethren in Courland and Latgale were once more no better than German serfs—the peasants were under the complete domination of the barons.

III.

From the middle of last century, however, Lettish nationality began to assert itself, and this led Russia, who was upheld in this by the Baltic Barons, to attempt the Russification of the country. When the Letts demanded Lettish secondary schools and universities, the Russians replied by Russianising the Lettish elementary schools. When the Letts asked for judges with a knowledge of the Lettish tongue, the Russians replied by making it illegal for any judge in Latvia to use Lettish. And so on. But the Letts declined to be Russianised, just as they had refused to be Germanised. Discontent often led to revolts, the most notable being that which took place during the Russian Revolution of 1905, and these were most cruelly suppressed by the Russians in co-operation with the Baltic Barons. If anything, the Letts hated the Germans more than they hated the Russians, and in the Great War upwards of 180,000 Letts fought in the Russian Army. When the war broke out they asked for the formation of a Lettish force, under Lettish officers, for the defence of their country, but it was not till 1915 that their request was granted. It was the Letts, and the Letts alone, who held up the German Army at Riga until September 1917—a feat which has never been given adequate acknowledgment. Shortly after the loss of Riga to the Germans, the Letts held a conference at Valk, and demanded the formation of a united and autonomous Latvia in a federated Russia. That was the definite beginning of the National movement. A *bloc* later was made out of all the Lettish political groups, except Lettish Bolshevists, of whom there were a few, and the Baltic Barons, the aim of which was the independence of the country, as against its Germanisation or its union again with Russia.

At that time all Courland and part of Southern Livonia were occupied by the German Army, and the *bloc* mentioned above had to work secretly in that portion of Latvia; yet it was able to give support to the creation and organisation of a Lettish National Council in those sections of Southern Livonia and Latgale that were still unoccupied by the Germans, and this

Council met for the first time on 17th November 1917. But in the beginning of 1918 German troops were in possession of all Latvia, and the German Government tried in the most unscrupulous manner to obtain from its people and from the Baltic peoples generally a declaration in favour of their being incorporated in the German Empire. At Riga and at Mitau, the chief town of Courland, *Landesrats* or Councils were established. Formed mainly of the Baltic Barons and their friends, these *Landesrats* voted for annexation to Germany. To give the business a better colour, several Lettish peasants were compelled by the German authorities to attend those Councils, but it was only under *force majeure* that these poor people were present. Not one Lettish politician took part in the farce. It was the Baltic Barons, with their sympathisers, who preached 'The German future of the Baltic,' and offered the ducal crown of Courland to William II. The defeat of Germany by the Allies put an end to all plans of the kind, but not at once.

After the armistice was granted to Germany in November 1918, the Letts established a State Council of Latvia, which was composed of members of the National Council and of the *bloc*, both of these bodies never having ceased their work for independence, and the Republic of Latvia—*Republika Latwija*—was proclaimed on the 18th of the same month. A Lettish Government, which was recognised as a *de facto* Government by the Allies, was set up, with Mr K. Ulmanis as Prime Minister, but it was encompassed with serious difficulties. To start with, there were nearly 100,000 German troops in the country, and of these 45,000 were in Riga alone. Not one of these Germans was friendly to the Letts, Lettish independence, or the Lettish Government in the slightest degree. According to the armistice, the German forces in Latvia were permitted to remain for a time as a protection against the Bolsheviks; but they proved to be nothing of the sort. Hardly had the Ulmanis Government come into existence when Latvia was heavily invaded by the Bolsheviks, who took Riga in January 1919, and quickly overran the greater part of the land. In these operations the Bolsheviks were assisted, openly or secretly, by the Germans, whether German soldiers or Baltic Barons, exactly as was the case in Esthonia.

IV.

In 1914 the population of Latvia was above two and a half millions, and the composition of the State Council showed the relative numbers of the people with regard to their national origin. The Council consisted of one hundred members, and of these seventy-eight were Letts, eight were Germans who were natives of the country, seven were Jews, five were Russians, one was a Lithuanian, and one was a Pole. The comparative smallness of the German element is most noticeable, yet that element made a great and determined effort to maintain its old control of the country. A 'Baltic Committee of Safety,' made up almost entirely of the Baltic Barons and Junkers, organised the *Landeswehr*—the local Germanic militia—augmented by German ex-soldiers, into a competent fighting force, and in co-operation with General von der Goltz brought about the capture of Libau from the Letts in April 1919. This town had become the temporary capital of Latvia after the taking of Riga by the Bolsheviks. Von der Goltz had returned from Finland, where he had been in command of the German forces, and had become the head of the German Sixth Army Corps, also known as the 'Iron Division,' and as the Lettish Army was engaged in a desperate effort to throw back the Bolsheviks on the north, he had no difficulty in taking Libau, where he made prisoners of several members of the Lettish Government, though Ulmanis, its chief, contrived to escape. In the following month the Germans, under Baron von Manteuffel, a subordinate of Von der Goltz, turned the Bolsheviks out of Riga and occupied it.

Meanwhile the Letts, after bitter fighting, had succeeded in driving the Bolsheviks out of about two-thirds of Latvia, and in June, with the help of the Esthonians, they attacked the Germans in Riga. At the moment there was a British Mission, under Sir Hubert Gough, in Latvia, and it interposed. An armistice was arranged, under which the Germans evacuated Riga, where Ulmanis and his Government were again established. After leaving Riga the Germans, in spite of their having agreed to evacuate all Latvia, made their headquarters at Mitau, where their strength was increased by fresh troops from Germany. The Supreme Council of the Allies intervened, and ordered the Germans to withdraw; but Von der Goltz for some time paid no attention to its commands, though ultimately he retired. It was while he was at Mitau that the paper currency mentioned in the beginning of this article was issued. A singular episode in this struggle of the Letts for their independence was the Bermondt affair. Bermondt's father was a German, his mother a Circassian princess, and he had been a bandmaster in the Russian Army. He had some property in the Baltic provinces. At the head of a Russo-German force he marched on Riga and captured one of its suburbs, but finally was defeated by the Letts, and his attempt collapsed. Not till the end of November was Latvia entirely freed from its enemies, whether of German or Russo-German origin, but fighting continued with the Bolsheviks up to mid-February 1920. Peace was made with Germany on 15th July, and with Soviet Russia on 11th August, of that year.

v.

Latvia is one of the countries which was devastated during the Great War, and the German occupation, coupled with the subsequent aggression of Von der Goltz and Bermondt, all but completed its ruin. A census taken on 15th June 1920 showed that its population had gone down to one and a half million; there were 100,000 horses, 300,000 cattle, 250,000 sheep, and 150,000 pigs fewer than before the war; most of the farm-houses had been destroyed, and the fields lay waste and desolate. What all this means will be understood when it is recalled that Latvia is predominantly an agricultural country, its physical characteristics and climate being similar to those of Esthonia. Before the war it had enjoyed an enormous transit trade with the interior of Russia. In 1913 the export and import trade of Riga, Windau, and Libau, the chief ports, reached a grand total of nearly £75,000,000. During the war ships were sunk at the entrances to these harbours, and trade fell to nothing; but it is rapidly growing again. Riga, which had more than half a million inhabitants in 1914, and was well served by railways, lost about 300,000 of its population, and its factories were gutted, the machinery being taken into the interior of Russia. Its harbour, however, is the best on the Baltic, and the city, it may be predicted, will come into its own again, now that its shipping facilities are being restored and its railways rebuilt. In the past the Letts never had many vessels of their own, and such as they had were, of course, registered as Russian. Latvia is at present getting together a modest commercial fleet, which will fly the national flag of red, white, and red, in horizontal stripes.

There is an enormous amount of reconstruction to be accomplished before Latvia can enjoy any marked measure of prosperity. Its Government, backed by all the Letts of Latvia and many Letts in America, is strenuously engaged on this task. Railways and roads, which naturally got into a very bad condition during the long period of hostilities, are being repaired or reconstructed. The ports are being improved, and the factories reopened and set going again. Many farm-houses have been or are being rebuilt. Formerly highly cultivated, and yielding fair crops of barley, oats, flax, and potatoes, the soil is once more being well tilled by the peasants, who are to become its owners, instead of the Baltic Barons and Junkers, for whom compensation is to be provided by the State. All this vast work means prodigious and ceaseless effort on the part of the Letts, who have small means, and are anxious to obtain assistance from outside. It is to their credit that, while freeing their country from its invaders, they yet at the same time did what they could in the way of reconstruction. America came to their help with supplies of food. It is money of which they now stand most in need. In a statement presented to the International Financial Conference at Brussels, the Latvian delegation suggested a foreign loan of twenty millions sterling as 'the only possible speedy way out' of Latvia's difficulties.

It must not be thought that Latvia has no resources. In its forests, which consist mainly of conifers and birch, and cover about one-fourth of its area, it has much potential wealth. Rather more than a million acres of forests belong to the State, the balance being in private hands. Much good redwood timber will be available for export. Another potential source of wealth to Latvia is its fisheries, which employed upwards of 10,000 men before the war, and are capable of substantial development. But, after all, the best asset of the little country lies in the character, sturdiness, and high intelligence of its people. There are comparatively few illiterates among the Letts, one of whose first acts was the founding at Riga of a national university in September 1919; it began with 1400 matriculants. And there are many secondary schools. Though the majority of the Letts are peasants, their standard of education has always been far higher than that of their Russian neighbours. The first Lettish newspaper appeared in 1862—till then the German element had prevented the Letts from publishing a journal. In 1914 there were ten daily Lettish papers in Riga alone.

Recent political developments are interesting. In April 1920 a general election for a Constituent Assembly of one hundred and fifty members was held on the basis of universal suffrage of both sexes, the age-limit being twenty-one. The result showed that out of all those elected upwards of a hundred and thirty were pure Letts, the composition of the rest being six Germans, six Jews, four Russians, and one Pole. The Assembly met in May, and a Government was formed with the patriot Ulmanis as its head. A large part of the work of the Assembly has been concerned with schemes for the reconstruction of the whole life of the country—schemes that are being carried out as speedily and thoroughly as is possible in the circumstances. In fine, here is a nation, a small but courageous nation, much tried in the fiery furnace of war, which, having won its liberties at a heavy price, is steadfastly resolved to maintain them at all costs, while also making the utmost endeavour to improve its position in every way. It is to Great Britain, more than to any other land, that Latvia looks for sympathy and consideration, and it is enough for a man to be a Briton to be warmly welcomed in Latvia.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER V.—*continued.*

III.

'FORTY miles away from Cobalt,' gasped the detective, Gatineau.

'I reckon that,' said the driver. 'I reckon it; but don't you ask me where we are. In the middle of the Sarah Desert of Africa, for all I know.'

'And we're right out of touch of anybody? Miles away from the nearest house?'

'Hundreds of miles,' said the driver fervently and with convincing inaccuracy. 'That full forty at least, as I tell you. I don't know of even a shack out this way.'

'I don't suppose there is one. Trust Neuburg and his gang for that,' said Clement bitterly, reviewing the situation and finding its meaning.

'There may be a telephone in that old mine,' suggested the detective, with no great conviction.

'Oh, there may be,' said the driver. 'There may be a "Packhard de luxe" only waiting to take us back. Anyhow, to look won't mean any harm. An' it'll be occupation. There's all the night yet.'

Clement and the detective went round by the trail to the abandoned mine. They felt their way carefully with their torches, and they carried their pistols ready. There was no need for the latter. The mine was stark and empty, its buildings degenerating into rot, its workings choked with weeds. There was not a telephone there.

They had left another torch with the driver, and he had spent his time carefully surveying the position of the car in the rather vague hope that she might be got out of the slime lake on her own power. As Clement and his companion returned, he called out to them, 'Nothin' doing with th' old girl. It'll take a team to pull her clear, and an overhaul in a garage when she is clear an' back at Cobalt. But she won't sink any more, so she's safe to sleep in.'

'We'll send back that team,' said Clement. He turned to the detective. 'Or, rather, I will. There's no need for you to walk in; I'll send back another car.'

'I'll come along,' said Gatineau.

'A hell of a walk on a dark night with a trail bad enough to be easily missed. You're risking a lot,' said the driver.

'We've got to,' answered Clement. 'You see, the reason we were lured out here, and marooned, is, as I look at it, that those people in the car want to get us out of the way, and keep us out of the way, away from Cobalt, for a long time.—Isn't that the way you see this, Mr Gatineau?'

'That's the only reason in it,' agreed the detective. 'I should say that we got to Cobalt before Neuburg and his lot were ready for us, before they had time to do whatever they wanted to do. On the spur of the moment they had to decide on this desperate trick to get us out into the wilds and strand us here. I take it that the man in the car signalled to Siwash directly he saw him.'

'I agree in the main,' said Clement, who had been thinking hard. 'But not that it was on the spur of the moment. This thing has been well planned. They knew of this derelict mine. They knew of this tricky bit of road that would land the unwary in the slime lake. They knew if they could get us out here we might be landed helpless. And to get us out here—well, Siwash must have been the bait. I don't see how they knew we knew of his presence on the train'——

'Perhaps his showing himself at North Bay was deliberate,' said the detective. 'Half-breed Indians with all the tricks of the woods don't give themselves away so easily. Although it's rather late in the day to remember that.'

'And the fact is neither here nor there, anyhow,' said Clement. 'Our chief concern is that we are out here, marooned; that we are ten or more hours' tramp away from Cobalt on this bad trail, and that during those ten hours Neuburg and his rogues will be able to do things—things connected'—he meant to mention Heloise Reys's name, but he boggled at that, saying instead, 'do things that our presence in Cobalt would have prevented. They have scored, and gained very valuable time.'

'But they, whoever you're talking about, *have* gained it,' pointed out the driver. 'You can't get away from that. That being so, where's the value of risking that tramp along a dangerous trail in a dark night? It's mortal easy to stray and get lost in these parts.'

'That's a risk I think we've got to take,' said Clement. 'They may be counting on the fact that we won't try to follow the trail during the night. I mean by that, they may need more time than those ten hours. Again, we may have luck, may hit upon a shack or a homestead where we could get a rig or some conveyance. And always, too, the closer we keep to their heels the more likely we are to keep touch with the scoundrels.'

'I don't know who they are, but these fellers seem a healthy lot of toughs from the indications thrown off,' said the driver. And as he voiced his ignorance Clement swung round on him with an inspiration.

'Do you know a man named Henry Gunning?' he demanded.

'Henry Gunning!' cried the driver. 'What! again? Do I know him? Why, the feller's an epidemic.'

Clement, startled by the tone of the man's voice, simply echoed the expression 'An epidemic?'

'He's certainly that. The whole world's asking after him.'

'What do you mean by the whole world?' demanded Clement in some excitement.

'In a manner o' speaking, I mean. I mean, he seemed an ordinary sort of feller up to a day or so ago. Then a big, fat man hits the burg, and he and a feller with him begins to agitate for this Henry Gunning'——

'That is Neuburg and Joe Wandersun. The big man is Neuburg,' said Clement.

'That's Neuburg,' said the driver. 'Well, I can understand your lack of heartiness about him—a shifty-looking mammoth he is. Well, then, they asked and asked fer Henry Gunning, regler raised the burg. And then, when they'd finished—when the subject might be considered dropped, so to speak—there came the ladies'——

'The two ladies,' said Clement quickly.

'Yep, the queen one, a real swell Jane, and the plain prune one. They made the burg to-day, and they asked. Henry Gunning is most sought after. The big shark had nothin' on them ladies in eagerness for Henry. An' now here's you.'

This seemed all very strange to Clement. If Neuburg had asked for Gunning, why should Heloise, in her turn, have had to ask so persistently? He said, 'I don't quite follow this. The big man asked for Gunning, you say, and then the lady asked. Does that mean that Neuburg did not find Gunning?'

'Oh, he found him. He found him fine. You bet *he* found him all right, all right.' From the amusement in the driver's tone it was evident that there was some ripe story connected with Neuburg's discovery of Gunning.

Clement ignored that. 'Well, then, why the lady? Why did she have to ask for Gunning?'

'Why?' said the driver. 'Why—don't you see?—because that Neuburg feller found him first, see.'

'I don't see at all.'

'Well, he found him first, didn't he? Took him away. Beat it with him'——

'What!' cried Clement; 'are you saying Gunning has left Cobalt with Neuburg?'

'First train out, sure,' said the man. 'This mornin', or, rather, yesterday mornin'.'

'And the lady'——

'But ain't I bin tellin' you all the time Henry was gone when she came in?'

Clement stared amazed at the faint blur of white that in the darkness represented the driver's face.

In the pause the detective, Gatineau, said, 'Then Miss Reys, this lady and her companion, are still in Cobalt?'

'They certainly are.'

Clement spoke. 'Until the first train out,' he said bitterly. 'That's why we're here. That is the meaning of this marooning. We were lured out here so that Miss Reys can be got away from Cobalt without our meeting or seeing her. They can't very well get her out of Cobalt until the morning; so they got me—us—out of Cobalt instead.'

Indeed, it was unmistakable. Gunning had been whisked out of Cobalt to some unconjecturable place, either because he was not in a fit state to see Heloise, or because, hearing of Clement's pursuit, Neuburg feared that his plan might be interrupted. Heloise, who would easily learn Gunning's destination, would follow him; but the coming of Clement to Cobalt, and his seeing Heloise and telling her of the plotting against her, meant the ruin of Neuburg's plans. Therefore Heloise and Clement must be kept apart until she could again start out on a journey to an unknown (so far as Clement was concerned) destination, and be swallowed by the vastness of Canada.

That was why Siwash, in his car, had lured Clement and his companions into the heart of this desolate place. Clement was to be marooned out of harm's way—and he was so marooned. The trick had been a complete success.

(*Continued on page 307.*)

CHILDHOOD AND AGE.

UNDER a leafy canopy
We walk'd, at summer's height—
He was a five-years' child, and I
A gray, a world-worn wight.

With life's first wonder in his eyes,
First smiles upon his lips,
His warm, soft hand in trustful wise
Into my hand he slips.

And for a moment, if so long,
We dwelt in fond delight—
My heart grown weak, as his grew strong,
By love's all-mastering might.

But soon the homing schoolboys pass—
The little fingers wind
And twitch to be released, alas!
Lest he be left behind.

So struggling, in the gardener's net,
A captive bird is found;
A troutlet so will pant and fret,
Having o'erleapt his bound.

But I held fast, and faster still,
The time being all too short
Of wise discourse to take our fill,
Our fill of fair disport.

In vain! for from my grasp he breaks,
And to his kind is flown;
Nor recks he of the blank it makes
When his bright glance is gone!

Yet wherefore pause, my winsome one,
Upon your golden way?
Your gracious errand, duly done,
Demands no longer stay:

A fair dream on a wakeful night,
Or, on a toilsome road,
A draught of pure and cool delight,
Most bounteously bestow'd.

THE STATELY HOMES OF ENGLAND.

By CHARLES G. HARPER.

PART I.

I.

MANY years ago Mrs Hemans wrote these lines:

> The stately homes of England,
> How beautiful they stand
> Amidst their tall ancestral trees
> O'er all the pleasant land.

They stand there yet, as stately as ever they were, but a good many have changed ownership since then, and the practice of selling properties is proceeding at an ever-increasing rate. The various Finance Acts passed through Parliament, beginning with Sir William Harcourt's Death Duties, are responsible in great part for the break-up of big estates and the selling of ancestral homes and collections of pictures; and apprehensions of greater burdens have also had their effect. But it is to be noticed that in a good many instances the peers and country gentlemen who are now throwing their properties so freely on the market are selling land rather than the ancestral roof-tree. Outlying acres are going at an extraordinary rate, and auctioneers and estate-agents have never had so prosperous a time as of late.

This wholesale selling of broad acres is not altogether so alarming as it may at first sight appear. Holders are selling at the top of a buoyant market, at prices far above any dreamed of twenty years ago, and with the proceeds they can pay off heavy and long-standing mortgages, or can invest in gilt-edged securities, which give them neither trouble nor anxiety. Moreover, at sales there must be buyers, and it is reassuring to those who desire stability to see both farmers and the new-rich purchasing and becoming landowners—the first in the way of business, and the second in an ambition to become a landed aristocracy. Both are prepared, and at a high price, to risk what fate has in store.

After all, land remains when all else decays. Rightly is it called 'real estate.' Every one feels the call of land, and desires to own some. As Pope put it years ago:

> Happy the man whose wish and care
> A few paternal acres bound,
> Content to breathe his native air
> In his own ground.

But not always is it the acres that come nowadays to market. Sometimes the ancient and stately homes also change hands. Sometimes, again, those mansions are so large and so stately that no one can be found willing to bear the burden of living in them. For, as a general rule, the more stately the home, the less of a home it is. 'Stateliness,' we may say, came into vogue in the time of Queen Anne, and spread alarmingly throughout the eighteenth century, when the classic tradition grew upon the decay in turn of the Tudor and the Renaissance styles of architecture. Then the nobility and gentry built for themselves those vast country-seats, with pillared elevations and enormous reception-rooms, which are the despair of their descendants. There were great houses before then, but never was there such an era for bigness as that. The Marquis of Rockingham, in 1750, built himself a mansion at Wentworth Woodhouse, near Rotherham, large enough for the Prince of Wales; Sir Rowland Winn built at Nostell Priory one fit for the Marquis of Rockingham; and Mr Wrightson of Cudworth built a house fit for Sir Rowland Winn. Each provided himself with a 'stately home' far beyond his own needs and status. That was in Yorkshire, but the same idea prevailed throughout England. Wentworth Woodhouse is the largest private mansion in this country. Its frontage extends to close upon six hundred feet, and all its appointments are on the scale of vastness. It used to be the scene of a noble and indiscriminate hospitality. A stranger had only to call there and ask, for him to be given a glass of ale and bread-and-cheese *ad lib.*; while the entertainments were on a regal scale. This gigantic mansion has long been the home of the Earls Fitzwilliam, the daughter and heiress of the third Marquis of Rockingham having married the third earl.

There is an exceptionally stately home which, although not supposed to be larger than Earl Fitzwilliam's in its cubic contents, has the largest frontage. This is Stowe, in Buckinghamshire, the old seat of the Temples, Dukes of Buckingham and Chandos. The length of its elevation is 916 feet.

There was once, indeed, a mansion larger

 [*All Rights Reserved.*]

than Wentworth Woodhouse. This was Campden House, at Chipping Campden, Gloucestershire, a truly 'stately home,' built in 1615 by Sir Baptist Hicks. It lasted only thirty-two years, for it was destroyed during the Civil War, when the Royalists burned it, lest it should serve as a harbourage for the rebels. Two pillars and a garden-house are the sole remains of this great mansion.

Campden House was probably comfortable as well as stately, for at that time architects had not lost sight of the fact, as their successors did for certainly two hundred years, that a house is intended for a home, as well as for entertaining on a spectacular scale. The most remarkable features of a typical eighteenth-century country-house of the stately order, beside its great size, are the care lavished upon the enormous banqueting-halls and drawing-rooms and the exceeding meanness of most of the bedrooms. Everything for display and nothing for comfort. Pope truly remarked upon this:

> 'Thanks, sir,' cried I, ''tis very fine,
> But where d'ye sleep, or where d'ye dine?'

Pope wrote thus of Blenheim Palace, after the following catalogue of grandeurs:

> See, sir, here's the grand approach;
> This way is for His Grace's coach;
> There lies the bridge, and here's the clock;
> Observe the lion and the cock,
> The spacious court, the colonnade,
> And mark how wide the hall is made;
> The chimneys are so well design'd
> They never smoke in any wind.
> This gallery's contrived for walking,
> The windows to retire and talk in;
> The council-chamber for debate,
> And all the rest are rooms of state.

Well might the poet conclude, after this recital:

> I find by all you have been telling,
> That 'tis a house, but not a dwelling.

Blenheim, designed by Sir John Vanbrugh, stands in a park eleven miles round, and has a frontage three hundred and forty-eight feet long, in a style suggestive of a public institution rather than a residence. Built for the great John Churchill, first Duke of Marlborough, who was dead before it was completed, it has ever been a cause of disputes and scandals. The Blenheim treasures of art were famous, but most were dispersed by the seventh and eighth dukes —in the first instance because the ducal revenues were straitened by the upkeep of the vast pile, and in the second partly through personal extravagance. The famous 'Marlborough gems' were sold, and the pictures almost wholly went—four hundred and fifty of them. Among these were the 'Madonna Ansidei,' by Raphael, gift of the King of Prussia to the first duke, and Van Dyck's 'Charles the First.' These two were purchased by the trustees of the National Gallery for £70,000 and £50,000 respectively. With Vanderbilt money, brought in by the present duke's wife (the second of two successive American duchesses), many of the Blenheim objects of art have been restored; but it had often been stated by the late duke that he could not afford to live at Blenheim. He instanced, as a minor example of his expenses, that he spent £200 a year on putty for the windows!

Castle Howard, the stately and monumental seat of the Earl of Carlisle, is another of Vanbrugh's solid designs: those architectural heavyweights which led to the famous proposed epitaph upon that architect who was also noted as a dramatist, but whose comedies are, compared with the brilliant wit of Sheridan's immortal plays, as plum-pudding to puff-pastry:

> Lie heavy on him, Earth, for he
> Laid many a heavy load on thee.

Castle Howard, in the distant view, affords a more pleasing spectacle than Blenheim. It is three hundred and twenty-three feet in length, only twenty-five feet less than the Duke of Marlborough's palace.

Chatsworth, the Italianate palatial residence of the Duke of Devonshire, was completed in 1707. It stands in a great park, ten miles in circumference—that is to say, rather larger than Richmond Park, which is nine miles round. Twenty years were occupied in building Chatsworth. The fourth Earl of Devonshire had been raised to the status of a duke, and he desired to be housed ducally. The sixth duke, in 1820, was seized with the brick-and-mortar (or in this case should we not say the marble-and-freestone?) mania, and undertook extensions occupying another twenty years. Like most other vast piles of the kind, it is a veritable treasure-house of art; and in common with its fellows, it has state-bedrooms and state-beds which hardly permit distinguished visitors to remain mere human beings between night and morning. One wonders what the great Duke of Wellington, visiting here, thought of them after his little, bare chamber and iron truckle-bed of a Spartan simplicity at Walmer Castle.

Welbeck Abbey, seat of the Duke of Portland, is a place famous far beyond its architectural merits, by reason of the eccentric building-operations of that mysterious recluse, the fifth duke, kinsman and predecessor of the present holder of the title. The 'Abbey,' which takes its name from a mediæval religious house formerly occupying this site, stands in that lovely Sherwood Forest district well known as 'the Dukeries.' It is not abbatial or Gothic in style, but rather of an uninspired and lumpish Palladian architecture, the exterior singularly resembling the usual type of a public institution for the unfortunate or the afflicted, rather than a ducal residence. Its long, rambling passages give so lengthy a route between kitchen and dining-rooms that a tramway has been laid down to ensure a quick delivery, and to make it possible for the duke, his family,

and his guests to obtain hot meals, instead of the half-cold ones with which his predecessors, uncomfortable in their widespread magnificence, had to be content. Visitors who know both the Zoological Gardens and Welbeck Abbey find a curious parallel between the Welbeck domestic tramway and those in the 'Zoo,' although it is not suggested that the lions have hot dinners.

The fifth duke's mole-like subterranean burrowings are not greatly used nowadays. The famous Welbeck tunnels, which he was still busily constructing at the time of his death in 1879, are said to have cost, together with his underground rooms, the great riding-school, and other works, some two millions sterling. The tunnels, which, regarded purely as engineering works, are not astonishing to any one used to our marvellous tube-railways, are just what engineers would term 'cut and cover' work—that is to say, shallow, and made by the simple process of cutting a sufficiently wide trench and then roofing it over. The only remarkable thing about them is that any one should have taken the fancy to construct these long underground approaches to, and exits from, the house, while nothing prevented the use of the ordinary drives. The longest of these tunnels is one-and-a-half miles, and emerges into daylight at the south lodge in the park. Like the others, it is lighted partly by glass 'bull's-eyes' in the roof, and in part by gas. The present duke prefers the sunshine and open air, and so some of the fifth duke's gloomy constructions have fallen derelict.

The equally famous so-called 'underground' ballroom and picture-gallery is no more wonderful in itself than the basement rooms of old-fashioned town houses.

One of the wonders of Welbeck—the great conservatory—was abolished in 1920. The cost of maintenance had become so great that the duke had it blown up with dynamite, as the labour of demolishing it by hand would have been too costly.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER V.—*continued.*

IV.

THE three men walked back along the trail towards the mining-town of Cobalt. The driver, with the unconcern of the Canadian, decided to leave his car where it was bogged in the lake and come with them. When he had switched off the head and rear lights they set out. Indeed, it was all to the good that this very sterling fellow came, for, though they went carefully, using their torches whenever they were in difficulties, there were times when his lead saved them from going astray. There were times when other trails branched away in such a deceptive manner as to make them doubt which was the right track. At these points the driver bent earthward, examining the tracks with the torch. 'This is the way,' he would say. 'There's the heart-shaped tread from the new Oldfield tire I got on the back-wheel.'

Moreover, he talked of Gunning and Neuburg in a manner that not only helped to enliven and pass the time, but also put Clement in possession of very valuable information. 'This guy Gunning hit Cobalt—well, days ago,' he said. 'He was half-plastered then, sh'd say. He got a below-surface job at the Kipawa mine, and the next thing you noticed was that some one had filled a prescription.* He began to be considerable lit up, though not enough to make him go bad on his job. I noticed the feller first because he used to sit about in the billiard-parlour I appertain to, scornin' soft drinks out loud and talkin' consistent. He's sure some talker, that Gunning feller.'

'Did he talk about himself?' asked Clement.

'Like hell he did. He'd talk about everythin', that feller. He give us th' story of his sad past, an' th' story of his thirsty present, and the story of his bonanza future. Pertickerly that future. 'Pears that when he gets evens with that future of his, Rockefeller, an' Timmins of Timmins, an' little ole Carnegie will look dear at thirty cents. His is the biggest noise in futures. There's mines and Wall Street finance in it, an' fruit-farmin' in the Okanagan, an' pulp an' lumber in Vancouver Island, all manner o' things, though he don't appear settled which is to be the which yet. But he is certain sure about one thing—it's all comin' to him through a girl.'

'Did he—did he mention the name of the girl?'

'He did, sir; it's a swell looker of a girl name of Heloise Reys. This girl you tole me of, I take it.'

'The swine!' said Clement harshly, wishing he could get his hands to the fellow who was so lost to decency that he made a woman's name a byword in saloons. 'Go on.'

'Well, he is the mean white all right, as you indicate,' said the driver. 'But I guess you want me to put you all wise. This girl, ses he, has a whole raft of dollars. Regler rolls in 'em. An' she's sweet on him. He ain't at all clean about that girl, Steve. The way he talks about her you c'n see he thinks her a soft fool. I didn't like his talk nohow, nor did th' other

* The only legal way to get whisky in Ontario, which is 'Dry,' is through a doctor's prescription, exchangeable at a Drug Store.

fellers. One of the chaps offered to break him up. . . . Still, that ain't in the recital'——

'It's good to hear, anyhow,' said Clement with rage in his voice.

'Ay. Well, there it was; this girl had been sweet on him when she was only a kid, he tole us. She had kep' true to love's young dream. She couldn't live without him, an' so she was comin' out to marry him in spite of all the world. She was travelling right across the water after years and years of separation to marry him. One feller said, mad-like, that any girl who acted like that fer the sake of Henry must 'a bin born crazy; an' Henry answered with a cunning grin, "Sure thing; but that don't matter so long as she's got the dough." An' another chap said, "Well, she ain't seen you in years, hey? Well, she'll only have to drop one look at a roughneck like you to be put wise." But Henry, he merely sniggered superior, an' said that he knew all there was to know about handlin' women. He'd deliver the c'rrect dope when the time came all right, all right. . . . Well, then, he'd been talking like this fer some days when this big chap come along.'

'But before that,' asked Clement—'did he say why he was in Cobalt, what he was doing there, whether he meant to meet the girl there?'

'He was just having his final spree; that's what he said. He'd come along to hit it up fer the last and final time fer the present. He was going to have one whale of a time, and then he was going back to play the good young man—anyhow, until he had hooked the girl and her money sure and safe.'

'And the big man came along and stopped that?' put in Clement.

'Yep. It was worth watching, I c'n 'ssure you. He steps off the train, and even as he checked his baggage he was askin' the baggage-master if he knew this guy Henry Gunning. Then he came out and asked others in the station. He asked earnestly, describin' the feller so patly an' anxiously that it began to be talked about, and chaps like meself, who knew Gunning, but who weren't there when this big feller made the town, got to hear of it. We all flocked down to give him the necessary infermation, but he had Henry's number pretty sure, an' was already doing his round of the low joints and billiard-dives. I came up with him just as he was going into me own habitual billiard-parlour, where Henry was usually located. When I saw that great, big, silent guy—say, did you notice how quick he is on his feet in spite of the bulk of him?—goin' in after our semi-filleted Henry, why, I guessed it'd be somethin' worth attending to. So I follered that guy in. An' it was a one-reel Bad Man *v.* the Compelling Eye act from the very first, I can 'ssure you.'

'What happened exactly?'

'Nuthin'. An' it was real thrillin'. Gunning, more 'n half-canned, was sittin' an' braggin' as big as a mountain an' as loud as Niag'ra. He was tellin' the tale, proper an' big. An' that big guy of yourn just came in an' stood beside the door an' looked. An' in the middle of a fortissimo passage that look began to dawn upon Henry. Henry sort o' faltered in his stride; his eloquence lagged; he switched round; he saw the big guy; his jaw fell open, and ceased to shut. He sat the jelliest-lookin' thing you ever did see, staring at your Neuburg. An' your Neuburg looked back, not at him, you know, but acrost his shoulder—a queer trick that. Them little, cold eyes of hisn, looking silently acrost Henry's shoulder, made me feel shivvery.'

Clement nodded. He knew that curious look, and could appreciate the driver's feelings.

'Well, then, Henry went green and limp. An' he stared like a man scared out of his life, while all the time the big guy stood there lookin' acrost his shoulder without a word. An' in a minnit Henry began to shake, an' he said in a quaverin' sort of voice, "Hello, Adolf!" At that the big man jist smiled, an' it was the coldest, cruel smile I've ever see'd; an' yet he said not a word, but switched his eyes just fer a second into Henry's, an' then turned an' went out o' the parlour. An' Henry got up an' follered him. You could see he hated doin' it. You could see he was scared crazy. Why, he could scarcely stand, an' it wasn't the drink in him that had made his knees shaky. But though he had to do it staggerin', Henry follered the big guy, who'd never said a word. I guess Henry knew it was sudden death not to. That big Neuburg looked a hell of a feller to cross.'

'He is,' said Clement tersely. 'And what next?'

'Well, Henry staggered out after the guy. An' me being near the door, I strolled along too. The guy walked straight down town without lookin' round, an' Henry shambles after. They got to a hotel, an' the big guy met another feller there—a feller who had come with him on the train. They talked a bit, Henry standing by like a whipped schoolboy, not noticed by either. Then the new feller hands Neuburg a key, and Neuburg goes upstairs. He didn't look round, an' Henry, though he sort o' hesitated, never really faltered, but walked up after, like a big dog. I don't know what happened upstairs or after; but later in the day the big feller went down to the deepo with Henry, lookin' more sick nor any man had a right to be, cringing after him. They boarded a train, an' that was the end of them.'

'And the next thing, I suppose, was the arrival of the lady?'

'Yep, that was the next thing. She came along and went to the hotel and began to ask, just like the big guy. Only, before she had asked a lot, asked the fellers like me who really did know the whole story, she stopped askin'.'

'How do you know that?'

'Why, didn't I go to her meself? Well, I did that. When I heard she was askin' fer Gunning, an' being about the only feller who had seen the whole thing through, I went along to the hotel to lay infermation.'

'And you saw her, Miss Reys herself?'

'Not her, exactly; her companion,' said the driver—and Clement knew that again a barrier had been placed between Heloise and the truth; that this man, who might have told her something about Henry Gunning, had, in fact, been kept away from Heloise deliberately. 'I saw the companion. Niceish woman, but handy with the frozen mitt. She was very much obliged, an' all that; was most kind o' me to come along, an' all that; but Miss Reys had found out all she required. She was in full persession of all the facts relating to an' concerned of one Henry Gunning.'

'Did you believe her?'

'Well, I were a bit knocked, I must say. I didn't quite see how anybody could have got to Miss Reys with the full an' detailed facts. Howsomever, what could I do? She stood there handing out the begone-with-you stuff, and I had to beat it. Course I told her that if there was anythin' I could do I was absolutely at her service.'

'And to that she said?'

'Thanks, and it was mos' kind o' me, but there was nothing they required. They had done all they wanted in Cobalt, an' wouldn't be staying on.'

'She said that, did she? Did she drop a hint where they were going?'

'Not my place to ask, an' she was none of your givin'-away sort. I just pocketed the dollar bill she handed across, an' beat it. An' that 's that.'

It was 'that' indeed. There was nothing unexpected about the recital, and yet it confirmed Clement Seadon's worst surmises. Neuburg had found and taken Henry Gunning away because he was not in a fit condition to meet Heloise, and also because the approach of Clement himself endangered that meeting. Heloise, arriving later, had first begun to ask after Gunning, and then by some sort of message or telegram—perhaps the man Joe, pretending to be a Cobalt friend of Gunning, had seen her at once—she had learnt that Gunning had left the town. She had probably learnt, too, where Gunning had gone to, and, since she had no reason to suspect him of knowing either that she was in Canada searching for him or that he was a tool in a criminal conspiracy directed against her, she had determined to follow her old-time sweetheart.

The companion Méduse had acted as guard, and had successfully blocked the way to any information concerning the real character of Gunning reaching the girl. While Méduse Smythe isolated the girl in the hotel, Siwash and his companion, by luring the Englishman out into the wilds, had seen to it that Clement was kept out of the way until the girl left. The completeness of the planning was admirable, and Heloise would vanish once more into the vast spaces of the Dominion without a word of the terrible truth reaching her.

And that plan was even more complete than Clement guessed, as soon became evident.

The three men had now tramped steadily for two hours along the trail towards Cobalt, and the sky began to fill with that gray light which is the promise of the coming day. They could see the trail at their feet, obtain a hint as to the utter loneliness and desolation of the surrounding country. The humped plain had, for the moment, given way to a ragged stretch of rocks that gave it an air of bleakness and ugliness.

Yet it brought a touch of hope also. They had not seen a house, nor even a prospector's shack, but they were aware that the trails branching into and out of their own had increased in number, and that, though this gave trouble in deciding upon their own route, it also indicated that they were at least approaching a stretch of land where habitations might be met.

It was while they were bending over a junction of trails, searching for the heart-shaped tread of their tire, that the next development of Neuburg's zeal in criminal efficiency manifested itself.

As they bent a fluff of grit kicked up almost in their faces. And then another. And as the dust rose they heard the 'whit-whit' of bullets, and, on top of that, the snap of a pistol.

'Whit-whit' went another bullet, a yard only from Clement, and 'sn-nap' went the distant pistol. The driver sprang erect with an oath. Clement flung him to the ground. 'Down on your tummy,' he cried, and he was down himself. 'Down, and crawl to cover under those rocks. There 's a man on that rocky outcrop ahead of us, overhanging the trail. And he 's shooting to kill.'

(*Continued on page 329.*)

TREE-SUGAR.

A REMARKABLE botanical discovery has recently been made which may have the effect of augmenting considerably our sugar-supply. It has long been known that sugar could be obtained from the maple-tree, but it has now been found that practically all shrubs contain a percentage of sweet sap which can be concentrated. With comparatively few exceptions, it would not pay to work the process; the exceptions, however, seem so rich in sugar-

sap as to promise to rival the best West Indian cane.

It appears that certain kinds of fir-trees which grow in abundance in so many parts of the Empire contain a hitherto rare trisaccharide in greater quantities than do some of the low-grade canes. This trisaccharide was formerly obtained from Persia and Turkestan, and was for generations one of the sources from which Asiatic countries obtained sugar. The Douglas fir, which grows in such quantities in British Columbia, yields a sap which contains an appreciable percentage of trisaccharide, and as soon as this source is worked on a commercial scale some thousands of tons of pure sugar should be forthcoming. At a moderate estimate, over a hundred thousand tons of tree-sugar per annum should ultimately be obtainable in Canada alone.

In a sense the discovery is not new, as native tribes in all parts of the world have had some knowledge of tree-sugar.

In British Columbia the sap of the fir-tree has been collected and boiled down for generations by Indian tribes, who gained their knowledge by noting the avidity with which bears tore down and devoured the branches. In spite of this, the sugar-bearing properties of this particular tree were not generally known to white men until a few months ago, when they were discovered by Professor John Davidson, botanist in charge at the University of British Columbia, Vancouver.

A curious point in connection with this particular tree is that the richness of the sap is such that wherever it exudes, from any cause, it crystallises, and flakes of pure sugar, from a quarter of an inch to two inches in width, and weighing from a fraction of an ounce to a quarter of a pound or more, form amongst the needles. These flakes are white in colour, and are of such purity that they can be used for domestic purposes without further refining. The opinion of Professor Davidson is that this natural sugar is superior, as regards sweetness, to that which has passed through a refining process.

It has been found that practically all the trees in the dry belt are sugar-producers, the most prolific being those on the northern and eastern slopes, whilst a very scanty yield was obtainable from the trees in heavily forested areas. This has been explained by pointing out that in the favourable regions there was a better air-circulation, whilst the trees received more sunlight and the ground was warmer. Trees exposed to a good supply of sunlight gather in their leaves carbohydrates. Ordinarily these are taken into the plant at night to supply tissue and storage-cells. It is stated, however, that in the dry belt an abnormal amount of carbohydrates accumulated on the firs. At the same time the soil, warmed by the sun, increased the root-activity so much in this region, where the nights are hot, dry, and short, that the roots worked on into the night absorbing moisture. As a result of the increased root-activity the root-pressure was immensely increased. This and the cessation of transpiration caused the leaves to become gorged with water. This water presently was forced to exude out of the leaf-tips into the hot, dry night, and rapidly evaporated. The water was heavily charged with sugar from the leaf-cells, which remained clinging when the water evaporated.

It is apparent that, whilst at first the free sugar could be collected and marketed, no dependence could be placed on either the quality or the quantity of a crop depending upon such fortuitous circumstances for its formation. It has been pointed out that in the hot season the occurrence of a few dull days enables the trees to use much of the excess sugar, or store it as starch to serve as a food-reserve. The cooling of the air also affects the activity of the sugar-forming cells in the leaves, and the roots absorb less moisture as the ground cools. Thus the Indians accept the sugar-yield as something to be fully taken advantage of in the good years, but as something to which they cannot look forward with any degree of assurance, though they do get a good deal on the average.

For commercial working it would, of course, be necessary to tap the trees and deal with the sap, instead of depending upon natural exudation, and it will be interesting to learn the results of the experiments in this direction which will, no doubt, be made immediately.

THE MYSTERY OF THE *WELL MET.*

CHAPTER V.—SURPRISE.

UTTERLY amazed, Hervey remained motionless—so astonished, indeed, that he almost doubted the evidence of his own senses. But when he closed his eyes and opened them and looked again the girl was still there, and he began to understand that she was real, and that, in fact, there had been hidden on board this boat a woman whose existence had been carefully concealed from him.

He noticed another thing now—that Drew was holding her by the wrist in a manner strongly suggesting that she was under restraint.

She was a prisoner, then; and, if so, she must be confined aft in the part of the ship that he had been so cunningly prevented from approaching by the tale of infection lingering there. But if she really were confined there, and brought on deck at intervals for a little fresh air and

exercise, it followed that there was aft no such danger of infection as Wilson and his companions had pretended to fear, and it followed also that the whole of their story of cholera and the deaths caused by it was false.

If so; if the captain of the schooner and the rest of the crew, other than these four, had not died of sickness; and if the Kanakas, who had undoubtedly been on board at one time, had not fled for fear of the sickness, what could have become of them all?

What had happened, then, and where were they, and what had been their fate?

For a moment Hervey felt sick and dazed with horror unspeakable, as he dimly glimpsed a tragedy more awful than his worst imaginings could have conceived.

This captive girl, too, the rigid and death-like pallor of whose beauty seemed now to tell him plainly of dreadful things that she had known, was perhaps the sole survivor of them all. What a position was hers, alone with these four men whose dark and scowling villainy had so impressed him even beneath the mark of their assumed goodwill! So far it seemed that they had spared her; but their mercy would not last for long—of that Hervey was well assured. He had a mind to spring up and rush upon them then and there; but one against four is long odds, and he knew them all to be very desperate and well armed, whereas he had no weapon.

Had he had only himself to think of, he might have risked all on one wild rush, scorning compromise, and going down, if that so chanced, in one splendid struggle. But the first necessity laid upon him was clearly to assure the safety of this lovely, lonely girl standing there by herself, in the power of men whom she must know to be murderers and outlaws.

He was well hidden as he stood half up the hatchway with his face on a level with the deck, along which he peeped cautiously; but there was some risk of discovery, since Sylvestre might wake at any moment, or the good-hearted Jacques put in an appearance. And discovery would mean, Hervey well knew, that he would have to fight for his life instantly against the four of them.

One last look he took at the pale girl whose presence on board he had so strangely discovered, and he swore to himself that he would save her or die. Then he dropped silently to the foot of the hatchway and returned across the sleeping Sylvestre to his bunk, where he lay down and set himself to decide on his best plan of action.

Two things were very plain to him. First, that he had little time to spare, for Manilla was not far away, and once they reached port, there would be no further need for him—which would mean, he had a very strong belief, that he would be promptly and effectively disposed of. Second, it was plain that somehow or other he must get in touch with the girl and let her know that she had a friend on board. Revolving various schemes in his mind, he lay still for a long time, till at last he decided on what seemed to him the simplest and most direct plan. Then he sat up with a prodigious yawn and much stretching of his arms and legs, purposely making noise enough to waken Sylvestre.

'Isn't there any grub ready?' he asked Sylvestre grumblingly when that individual sat up and looked around.

'I 'll go and see,' Sylvestre answered, and went off, really, as Hervey guessed, to make sure that all was clear and the prisoner safely hidden below again.

A steady and favourable wind had sprung up while he was below, but Hervey made a show of considerable uneasiness, and remarked once or twice that he would have to keep a good look-out that night. About midnight he established himself at the wheel, and waited patiently for a couple of hours. The night was dark, the breeze very steady, so that the weather conditions were favourable as he hurriedly lashed the wheel, and next committed one of the greatest of all sea crimes—abandoning his post at the helm. Hurrying forward on light and cautious feet, he found Sylvestre curled up in a snug corner sound asleep, and a little way off Jacques, who was supposed to be the look-out man, snoring in the bows in such a position that one strong push must certainly have sent him overboard. Hervey was very strongly tempted to avail himself of the opportunity presented to him, but the thing seemed a little too much like murder, and so he left him there fast asleep, and hurried back to the aft hatch.

This was carefully battened down, as Wilson had taken opportunity to point out to him when speaking of the fear they all had of the infection supposed to be lurking in the cabins below. But Hervey was not surprised, when he came to look more closely, to find that the fastening was more secure in appearance than in reality, and that the hatch could easily be opened. In a moment he had it uncovered, and hurrying below, he found himself facing the door, slightly open, of the main cabin. He entered it, and looked quickly around by the light of a small lantern he had brought with him. It was just such a cabin as that of any other small trading-schooner, except for one or two small signs that suggested a woman's hand had once been busy there. On one side were the doors of three smaller cabins. He tried the first, and found it empty. When he tried the second, he found it locked, and a slight noise from within told him it was occupied.

He stooped and put his lips to the keyhole.

'Hist!' he whispered warningly. 'Hist! Who is there?'

'Who is it? What do you want? What do

you want?' a quick, high voice called, its tones vibrant with intense fear.

'Hist!' he called again. 'Don't be afraid; don't make a noise. I'm a friend.'

'That's a lie,' the voice answered. 'I have no friends here. You are all murderers—all. Go away, or I will scream till the others know what you are doing.'

'I'm not one of them. For God's sake, listen to me,' he whispered again. 'Be careful—don't make a noise. Listen.'

'I will not,' she answered. 'I know you all—all of you. If you are still there when I've counted three, I shall begin to scream to let the others know. One—two'——

'Don't be a fool,' he broke in roughly; 'you'll destroy us both. Are you so safe and happy you can afford to throw away a chance of help?'

'Help from you—from any of you?' she answered bitterly. 'I will never trust you.'

'Then I'm done, and so are you,' he answered. 'My name is Hervey Drake, and I've been wrecked, and picked up by these men when I was nearly dead from hunger. I did not know you were on board. They told me the captain and part of the crew had died from cholera, and that all this part of the ship was locked up for fear of infection. But I got sight of you this afternoon on deck, and I'm risking my life to get a word with you. For Heaven's sake, trust me and open the door.'

'But I can't,' she answered. 'I fasten it myself, but it's locked on the outside as well.'

'Do you know where the key is?'

'Sometimes it's on the shelf near the stove,' she answered.

He looked, and by good fortune found it there. Taking it, he unlocked her door, and then, though she still hesitated a moment, the door opened and she came out. She was fully dressed, for she had lain down in her clothes, and she looked at him with great eyes of utter fear, one hand pressed against her beating heart, and one lifted to her throat, where he could see the muscles moving convulsively. But she faced him with a proud bearing for all her obvious fear.

'Who are you?' she said. 'Have you come to kill me? You are not one of them?'

'No, no,' he answered. 'I have come to save you, God helping me.'

She did not answer, but looked at him very earnestly by the dim light of the lantern he carried, and with an anxiety that was a veritable anguish.

'Won't you trust me?' he said gently.

'At least you are none of them,' she said with a little gasp.

'I am not,' he exclaimed; and with a kind of restrained passion he went on: 'You must trust me; it's the only chance for us both. Tell me what has happened.'

'The schooner belongs to my father,' she answered. 'He is Captain Endicott. I am Lucy Endicott. I have been with him his last two voyages. We were bound for Sydney, when we sighted an open boat with four men in her. We took them on board. They said they were shipwrecked sailors. They were nearly naked and starving. Father gave them food and clothes. The next night they took us by surprise, and killed every one except father and me. They kept father alive to navigate the ship, and me, because father would have done nothing for them if they had hurt me. He only consented to help them so as to save me. They told him to take them to Manilla, but he laid their course for Australia. He hoped to get help there. But they found out somehow, and threatened us both most awfully; and now they come to him only to check the position they work out for themselves.'

'No; I've been doing that for them,' answered Hervey grimly. 'I didn't know. Where is your father?'

'In there,' she answered, pointing to one of the doors. 'He was wounded in the fight, and he is very weak and ill. They let me nurse him in the day, but at night they lock us up separately. He is so weak, I am afraid he will die of exhaustion—unless they murder us both first.'

'They sha'n't murder either you or him,' declared Hervey cheerfully; 'I'll attend to them for you. There was one of them I nearly threw overboard a few minutes ago—and I wish I had, too. Keep your courage up, and tell your father it's all right now. One honest man ought to be a match for four rogues.'

He nodded to her reassuringly, for indeed he felt quite confident of success. Numbers were against him, but he had on his side the enormous advantage of knowledge and surprise. Sylvestre and Jacques could easily be mastered as they slept, and choked into silence and insensibility before they could either resist or raise an alarm. As for Wilson and Drew sleeping in the forecastle, two swift blows with a marlinespike or a belaying-pin should account for them. His confidence was so obvious that for the first time a little hope showed in Lucy Endicott's tortured eyes, and when he nodded at her boyishly and smiled, she smiled back, so that he thought her more lovely than he had ever dreamed loveliness itself could be.

'We're all right now, you'll see,' he said, and ran up on deck.

But surprise, that puissant ally, had turned traitor, for, as Hervey Drake set foot above, a tall form rose in the darkness and struck him down with one tremendous blow that alighted crashing on his head.

'Good thing, Sylvestre,' said Wilson, stooping over the prostrate man with his cruel and evil smile—'good thing you heard them talking and warned us in time.'

(*Continued on page 333.*)

A DELTA VILLAGE.

I.

THE delta of the Irrawaddy is one of the three or four deltas in the world which have a perfect deltaic formation, and which, by reason of that formation, have become the wealthiest and most fertile parts of the countries in which they lie. Over hundreds of miles the Irrawaddy—or the Great River— flows along from the far-distant Himalayas in the north through the gorges of Upper and the plains of Lower Burma until, south of Prome, an ancient capital, it suddenly spreads out and forms innumerable creeks and waterways throughout the region between that town and the coast. For thousands of years it has been depositing silt, brought down its course, and has gradually built up a group of huge islands, most of which are highly cultivated and produce a constant supply of that rice which is an essential article of diet for one-third of the human race, the millions in the East. This land is still very low, and at times of high tide practically the whole of these thousands of square miles which form the delta of the Irrawaddy are under water. All communications throughout this region are by water, and as one moves along in an Irrawaddy flotilla launch, or in a Government steamer, one passes boats of all sizes—from *sampans* (high-prowed boats driven by the oarsman standing in the stern) and dug-outs (long canoe-shaped boats, made by hollowing a log with fire and chisel) to the elaborately carved paddy-boats and huge barges. Near a village one may witness little children paddling diminutive dug-outs, racing in great glee against the launches that pass along. The water is almost as much their home as the village street, which during the rains is the only dry land they know.

In a fertile country such as this, a large number of villages have established themselves. Most of them in the early days of British occupancy were merely scattered groups of huts, erected on the only piece of high land in the neighbourhood of the fields, which were either being brought under cultivation or were actually under cultivation. Gradually, as cultivation spread, these groups closed together, and in many parts of the delta what were villages twenty years ago have expanded into towns managed by municipal committees, who provide roads and street lighting, and secure reasonably decent sanitary arrangements for those residing within the area. Others have not yet reached that stage of advancement at which they are entitled to regard themselves as of sufficient importance to be designated towns, but many of them are built on excellent sanitary lines, and possess good roads, open spaces, bazaars, court-houses, and even in some cases electric-light or petrol-gas.

One of these villages is not unworthy of description. It lies not far from the Gulf of Martaban, on one of the numerous creeks through which the waters of the Irrawaddy discharge themselves into the sea. These creeks are frequently in places a mile in breadth; others of them are hardly broad enough to allow two steam-launches to pass each other. At one place where the main stream has made a clear break through, the breach is picturesquely styled 'The Hole in the Wall.' The land around the village is very low land, and if a visit is paid to it during the rains, the reason why most of the houses are built on posts will be discovered. If they were not, the lower storeys would be submerged. The water may be only a few inches deep, but still it is there—that overflow of the mighty torrent on which the whole country depends for its agricultural prosperity.

Although one might imagine that such conditions would be insanitary, the people seem healthy and happy. As one arrives at nightfall and ties up at the little wooden jetty provided for the purpose, innumerable lights are seen flickering along the front, little tin lamps that light up the stalls of the bazaar sellers. The hum of many voices strikes upon the ear. You wander ashore, going down the main street. On one side of you are the dark waters of the river as they pursue their unceasing way to the ocean; on the other are the houses of the principal inhabitants of the place. Many of them are quite substantial structures. Some are of brick, but the great majority are of wood. The fronts of these houses are thrown open, windows and doors alike, and in many of them one sees happy groups of people, gossiping after the day's work is done. They lie back in long arm-chairs or sit on the floor. Here a schoolboy is busily preparing his next day's lesson at a table; there the evening meal is in progress, and you see the large dish of rice from which each helps himself with his fingers, making the rice into a ball with a tasty morsel of curry-stuff, prawn, or salt or dried fish from one of the other bowls.

Everywhere is an air of contentment. The bazaar sellers outside are selling the small black Burma cheroots or the large 'whacking big' variety immortalised by Kipling, or packets of 'Polo' cigarettes, or a meal of rice fastened up in a piece of plantain-leaf, or the popcorn made from rice which children love, and to which even their parents are not averse. In another corner is an old Burmese woman turning over with deft skill a huge mass of batter, which she is making into a sort of pancake. Farther along one comes across the dynamo which produces the electric-light that is used throughout the town. The thud, thud of its engines had

become apparent as the village was approached, and the whole night long the noise persists. The dynamo appears to be an old one, but it serves its purpose. It lights the village streets, which hold about a thousand houses with five or six thousand inhabitants. It distributes light to private householders who are prepared to pay about five shillings a month for each lamp provided, and its operations are supervised by a committee, of which the local Government official is the chief member. The cost for providing this form of lighting, which is regarded—even in many of the larger towns of Europe—as still something of a luxury, is defrayed from local funds.

As we proceed along the main street—unnoticed—the strains of a musical instrument are heard, and, to our surprise, we see in the corner of a house a Burmese boy, about sixteen or seventeen, playing, not jazz or foxtrot airs, but high-class music on a piano, an instrument unknown outside the larger towns, and even there practically confined to European houses. Still going on, for most of these towns and villages in the delta stretch for long distances along the banks of the river (behind the village the land frequently dips away so that inward extensions of house-building operations are impossible, and few places with sufficient high ground are to be discovered from which earth can be taken for reclamation purposes), the next house one comes to is that of the *chetty*—a Madrassi money-lender—who, in spite of the vituperation that has been heaped upon his head, has done much to finance agricultural activities throughout the greater part of Lower Burma. It is not difficult to detect his house. The front is protected by great barred doors and windows, generally painted blue. Behind these one notices, clad in scanty garments—naked to the waist—the figure of the *chetty* making up his books after his day's transactions. He is seated by the box in which he keeps his funds and those books of accounts which are at once the despair of the income-tax collector and the marvel of the judge who has to try a suit in which the *chetty* is seeking to recover a loan from a defaulting borrower. The interest they charge may seem enormous in the eyes of the Western accustomed to the low rates prevalent in his own country. Twenty to thirty and even fifty per cent. is not uncommonly charged on well-secured loans; but in defence of the *chetty*, it may be observed that the Burman does not hesitate to take advantage of him if he can, and that the security which the *chetty* takes frequently does not serve to repay the loan which he has granted.

From the *chetty's* one passes on to a place near the bazaar where brilliant lights attract the attention of the passer-by, and a loud-voiced youth, to the accompaniment of the beating of a brass gong, invites those standing around to 'come along and take a *doh-anna* ticket' for a *Zat-pwè*—a Burmese dramatic entertainment. He is speaking in Burmese, but mixes up Hindustani (*doh-anna*—two annas or four pence) and English (ticket, which is pronounced with the accent on the last syllable) in order to cause laughter amongst the good-humoured crowd that surrounds the entrance-door. For the two annas a whole night's enjoyment may be indulged in by a people not yet sated with the more concentrated, but no less transitory, pleasures or entertainments of the larger towns. There old and young, even mothers with babies at their breasts, will sit the whole night long watching the graceful, if languid, movements of the principal *danseuse*, and listening to the time-worn jests and doubtful puns of a favourite clown. The attractions are not sufficient to overcome the repugnance which is aroused by the heat and the thickness of the fetid atmosphere, and so, after passing the local liquor-shop, at which a fermented juice of the palm-tree, or beer made from glutinous rice, is sold, and outside which a noisy crowd of Ooriya or Tamil (both Indian races) coolies are gathered, the launch, or house-boat, or dak-bungalow, or rest-house at which the night is to be spent is reached.

Before nine o'clock most of the houses have shut their doors, and all, except those at the *pwè*, have retired to rest. Any one found wandering about after that hour renders himself liable to be suspected of nefarious purposes. Owing to the large number of criminals in certain parts of Burma, the villagers have sometimes to form themselves into patrols and parade through the principal thoroughfares of the town or village in order to prevent thieves and burglars from practising their trade too easily.

II.

In the morning one is awakened by the noise made by the steam-whistle of one of the Irrawaddy flotilla launches. Looking out of the windows, one sees that it is called the *Haldo* of Glasgow—the headquarters of the Irrawaddy Flotilla Company. Throughout the day these launches come in and go out, discharging and carrying away hundreds of passengers as they pass from village to village. In most places they halt in the streams, sending off in a *sampan* those who wish to go ashore, and bringing back those who have been waiting for its arrival. The Burman is a great traveller. He likes nothing better than moving about from place to place, visiting his relations in some far-distant part of the country, and returning home at his own time.

Early in the morning the bazaar opens, a big, shed-like structure, in which there may be anything from fifty to two hundred or three hundred stalls. The various classes of goods sold are grouped together. There is the hardware section, where one can purchase all sorts of articles, from

lamps, pots, lanterns (made out of tin cut from kerosene-oil tins), to the agricultural *dah*—half-sword, half-chopper—from which the Burman is never separated when he makes a jungle trip or when he is clearing vegetation. It is his pocket-knife, his meat-chopper, his tree-cutting axe, his firewood-collector, and too frequently the weapon with which he makes a savage assault upon some other Burman with whom he has quarrelled. There is what is known as a *Toly-Moly* (miscellaneous) section, where all sorts of articles, from studs and buttons to pin-boxes, mirrors, belts, shirts, and sock-suspenders, can be purchased. A vegetable section, a meat section, a fish section, a dry-goods section, and a silk and cotton section fill up the main portion of the bazaar enclosure. It is here that most of the purchases of the day are made. The profits of the stall-holders are not great, but most of them, by careful economy and clever bargaining—which are outstanding characteristics of the Burmese woman—manage to earn sufficient for a livelihood.

From outside one looks towards the Government offices, in which may be found the chief local executive official, called the Township Officer—almost invariably a Burman. He is responsible for the peace and tranquillity of his township, a portion of a district, sometimes exceeding a thousand square miles. He is expected to be acquainted with all that is going on within that area; he is responsible for the collection of the land-revenue tax, the capitation-tax, and the income-tax. He is generally a magistrate, and if he has first-class powers can sentence a criminal to two years' imprisonment on one charge alone. He keeps in close touch with the activities of the police, and is frequently responsible for the work of the Treasury Department—a department through which Government pays out sums due by, and receives sums due to, it. He is also possibly in charge of the Registration Office, at which all documents of sale or mortgage of immovable property over one hundred rupees in value must be registered. He is assisted in his work by an additional magistrate and by a judge. On him depends the efficient administration of the area under his charge. He is one of the most important links in the governmental chain. He requires tact, experience, and strength of purpose to perform his duties successfully. He must also be well educated, for his opinion on many difficult administrative problems is frequently called for by Government. He holds village inquiries when a new headman of a village is to be elected; he is responsible for the expenditure of a portion of the District Cess Fund—a fund which is made up of contributions from cultivators, and which is utilised for improvements within the district; he inspects fishermen's nets, checks the number of people in a village to see that all have paid capitation-tax; he inspects what are known as 'kwins,' the survey unit for purposes of the assessment of land revenue, and sees to it that the maps maintained by the Land Records Department are correct, and that assessments have been properly made. He decides, in consultation with villagers, whether a liquor-shop is necessary or not in any locality.

The magistrate's day is a full one, and as one halts outside his court one sees a throng of petitioners waiting below to present petitions on all manner of subjects, from an application for a grant of land to a complaint of insult. In a corner of the Government building is a cage in which are kept prisoners who are under trial, with a mounted guard standing over them; and in another corner are the witnesses summoned to appear to give evidence against these offenders.

As you pass through the streets you can see in the *chetty's* shop a cultivator signing a promissory note; you watch the throng passing down to the great barge with its corrugated iron covering to await the arrival of the next Irrawaddy flotilla launch; one or two Chinamen and Indians making their way to the local opium-shop for their day's supply of that drug; a few coolies having their morning dram at the local toddy-shop; one or two sweepers making futile efforts to clean drains or cut down the thick vegetation which seems to have grown up in the night; and a yellow-robed Phongyi passing along with downcast eyes, holding in front his begging-bowl, in which he receives the pious offerings made to him.

As the launch slowly makes headway against the current and the village is left behind, attempts to generalise from the impressions left upon the mind leave one in a state of wonder at the curious fusion that has taken place of Eastern customs and Western appliances; and the question irresistibly presents itself whether the Indian and the Burman will as representative institutions gradually establish themselves, manage to retain some of that pride and that reserve which give to many of their actions a supreme dignity, but on which modern democratic tendencies do not appear to set great value. And to Britishers, too, no less insistent is the problem whether their race will maintain those high traditions of rule which have enabled them to create an Empire bound by those 'ties which, though light as air, are strong as links of iron.' Will they be successful in the great political experiment that has just been initiated? Will they, by wise counsel and purposeful policy, and by the exercise of that magnanimity which is 'not seldom the truest wisdom,' be able to infuse into India and Burma that new spirit of humanity which everywhere is seeking expression, but so far seems to have signally failed to achieve even the most practical of its aims?

THE BEST POLICY.

By MARY F. RAPHAEL, Author of *Phœbe Maroon, As Chance Would Have It,* &c.

I.

THERE were four of them: Gaston Sucque, Miraso, Mimie la Mutine, and Rose de la Vallée; and all eyes were upon them as they strolled across the grass-plots, threading their way amid the throng of people.

Such a motley throng! There were enthusiastic American tourists and English visitors, languid from the heat in Paris, who had seized the excuse for spending a long day in the fresh air. There were small groups of indigenous *bourgeois*, bringing baskets laden with *déjeuners* to be enjoyed under the leafy trees. There were parties of students, artists, *midinettes*, as well as some of the fine folk who had run down in their 'autos' from Paris. There was even a sprinkling of famous meteors from the operatic and theatrical world.

Yes, all eyes were upon the four. And small wonder, too. For Gaston Sucque, better known as 'Glou-glou,' was the world-famed, inimitable, and side-splitting clown drawing nightly streams of people to the Hippodrome, in spite of the heat. And Miraso was the great Italian tenor just then enchanting the French musical world. As for Mimie and Rose, they were radiant stars, scintillating brightness at the Folies Bergères.

They had all lunched—not wisely perhaps, but extremely well—at the Trianon Palace Hotel. It had, in fact, been a superb meal, tempting them to disregard, with careless rapture, the wisdom of moderation.

After *cafés noirs*, cigarettes, cigars, and priceless liqueurs, they had sauntered through the park to see the fun, the fountains, and the crowd.

Wherever they went, people nudged one another and whispered, '*Tiens*—it is Glou-glou and Mimie la Mutine!' or, 'But look, then, quick—Miraso and Rose de la Vallée!'

Mimie and Rose, very *chic* and charmingly garbed, enjoyed the impression their party made. Glou-glou, when he caught the glance of a knot of people, 'played up' for their benefit. He winked, smiled, pursed mysterious lips, and nodded furtively as he walked along.

'Glou-glou—*farceur!*' the people murmured as he passed. They adored him. Never, *parbleu!* had there been so *épatant* a clown.

The four of them strolled across the grass, chaffing, joking, and enjoying the sparkle of the 'Grandes Eaux'—and of one another.

But then, all at once—a bolt from the blue—had come a sudden disturbance.

Glou-glou's hand went into his breast-pocket, and he stopped as if he had been shot. He emitted a prolonged whistle.

'What is it?' they asked him.

'Oh, nothing,' he answered. 'Nothing to give yourselves a *migraine* over.'

Perhaps the joyous effect of Clicquot, Beaune, and green Chartreuse still pervaded his heart—or another organ—with a rosy glow, and gave him courage to dissemble. Who shall say? Anyhow, he was determined not to upset his friends, and he played the game nobly.

For he had missed his pocket-book. And it contained French bank-notes to the amount of four thousand francs. Too much for prudent people to motor down to Versailles with on the day of the Grandes Eaux! But when is a clown prudent?

Later, of course, the truth came out.

'My pocket-book—I have lost it—*on me l'a chipé.* Some *filou*—some rascal of a pickpocket, no doubt. . . . Well, well, so much the worse for me—and so much the better for him! I sha'n't make myself bad blood because of that.'

'But how much was there?' asked Mimie. Let a French woman alone for seeing the practical side of things!

'Eh—*ma foi*—what do I know, me? I had notes for four thousand francs, and a couple of hundred besides. But, then, I paid for our lunch.'

'*Cielo!*' said Miraso. 'Four thousand francs! But, Glou-glou, art thou then mad? Come to the police-station at once.'

'The police? To drag you all to a police-station by this heat—away from the fountains and the open air? *Ah, ça—pour rien au monde,* for nothing in the world! I'll telephone, and offer a reward. And if then I find not the thing—*je m'en fiche*—I don't care.'

He left them, hailed a trap, and drove to the nearest telephone-office.

'*Ah, ce Glou-glou!* A good chap—but he has *la tête félée!* What can one do for a crack-brain like that?' they asked each other.

He rejoined them in a few minutes. Apparently the pocket-book was forgotten. At any rate, its loss was not allowed to dim the afternoon's pleasure.

II.

The following day Versailles wore an ill-kempt look, after the fête of yesterday.

Old Bougros, the park-sweeper, was indefatigable that morning. He darted hither and thither over the grass-plots, along the pebbled paths, in and out between the gay flower-beds, like an eager bird. Not a snip of paper escaped those vigilant little eyes of his. Agility moved his stumpy figure and his bowed, crooked legs in their blue-linen trousers.

He wielded his long, thin broom, and carried his pronged fork with the ease of Neptune himself.

As he worked, he reflected that perhaps it was as well all the Versailles fountains played only four times yearly.

'*Sapristi*, but what disorder! It was to break the heart! And to-day, *parbleu!*' he added, as he spiked a piece of paper and gathered up a length of yellow wool, 'there is a bit of everything.'

It was true. Fragments of toys, of silver paper, banana-skins, shreds from exploded bladders of tinted air-balloons—the short-lived joy of the children—jet-beads, pearl-beads, coloured-glass beads, ends of cigarettes, and innumerable empty match-boxes were littered everywhere. The green iron chairs were misplaced and overturned.

The fountains had resumed their life of inaction. Against the stone copings of the now stagnant water the summer breeze had driven a similar flotsam and jetsam. Like the human crowd that had thronged the gardens yesterday, it was a motley mass.

Old Bougros stood at the margin of the Neptune fountain and took disapproving stock of the drifting mess. Across his neat and frugal mind flickered the doubt of whether the game was really worth the candle. All that waste for so short a time of pleasure? His sense of orderly economy was baffled. But suddenly a mental picture banished his qualms. His *vieille* and his *petite*—his wife and young daughter. *Certes*, there was no better wife in France than his old woman. And Babette was a love of a girl—*une fillette à croquer!* They were at home, hard at work. . . . The thought finally routed his misgivings.

Eh, name of a dog, one must live! And if things remained always in apple-pie order, no park-sweeper would be needed. Père Bougros's occupation would be gone! What misfortune, *mon Dieu!* And as to the old park, who would recognise it, without its litter—and without him, Bougros, to remove it?

Dame, oui! Had he not served the town for twenty-nine years? Babette was bent on being apprenticed to the enchanting trade of dress-making. When would Père Bougros have put by enough francs to pay the fee for that? But, *bigre*—yes—she must have her chance some day.

It was very hot. He sat down on one of the stone seats under a horse-chestnut tree. The shade was grateful. He unknotted the red-and-white handkerchief into which his *vieille* had tied his meagre lunch—a hunk of bread spread with lard, and a pear. The repast ended, he lit a long, thin 'cigar'—one of those ungodly-looking black weeds wherein the French workingman apparently finds delight. But at last it, too, came to an end, as do all things—good and bad—in this life.

Père Bougros rose to his feet, and started again to gather up the remnants left by yesterday's merry-makers.

But how the grass had suffered, *mon Dieu!* Dusty and trampled, as if a herd of cattle had been let loose over it. It was incredible! . . . His foot stumbled upon a small object, dropped, no doubt, by one of yesterday's visitors.

He stooped and picked it up. *Tiens!* a pocket-book! A good one, too. Some unlucky *gars* must be cursing his bad fortune. *Saperlipopette*—but what elegance! *Certes*, this smart brown leather and these gold letters had not belonged to a poor devil of a pauper.

He opened it. Three or four letters addressed to Monsieur Gaston Sucque, at the Hippodrome, Paris—and—*mille tonnerres!*—notes—four notes—*Dieu des dieux!*—of a thousand francs each! And more—smaller notes—besides.

His trembling hands closed the pocket-book. He was quite pale, and his heart beat violently.

It was an immense fortune. He had never handled one-tenth such a sum. How to restore it to the owner—and quickly, quickly, before it burned a hole in his conscience?

The police? *Que diable!* For nothing in the world would he entrust the police with so much wealth! Not even the police of Versailles, whom he, Bougros, had known since the year one. It would be wrong—it would put irresistible temptation in their way.

This was his affair, *sacré mille cochons!*

Besides, there might be some little *bénéfice* for him to be gained from it—a *pourboire*, for example, as recompense for returning the great 'find' to its owner.

Stop; let him think. *Nom d'un nom!* he must think.

He took out the red-and-white handkerchief, now empty of his lunch, and, with a hundred precautions, wrapped up his treasure-trove. He placed it carefully next his thumping heart, within the shelter of his blouse. Then he trotted to a seat near, and sat down.

He felt quite overcome. He took off his hat. With the back of his hand—handkerchief being unavailable—he wiped the perspiration from his forehead.

How to return the thing? Well—he would have to go this evening after supper by the seven o'clock tram. But first he must tell his *vieille*. . . . *Ah, dame, oui!* . . . The women—they were sometimes difficult. Yet, no doubt, he would find the means to sweeten her.

III.

When he reached home, however, his *vieille* upbraided him for being late. The supper had been waiting. The tripe was burned. She was so agitated that the moment for his great revelation seemed inauspicious. It would only upset her still more. Better to wait till

to-morrow to tell her of his find and return it to its owner.

In his strip of garden, after supper, he smoked another black cigar. Now and again his hand crept into his blouse and patted the pocket-book. And mentally before his eyes fluttered those four bank-notes.

Madame Bougros went early to market the next morning, so he postponed his disclosure till the evening.

All day, while sweeping, his mind hovered round the pocket-book and its contents. If it had been his—*Dieu des dieux!*—what could he not have purchased with it? A muff for the cold weather for his *vieille*, the apprentice-fee for Babette—what comforts it would have secured!

Towards evening he had a bad head from so much thinking. His women-folk persuaded him to go early to bed. So again he deferred restoring the treasure till the morrow.

And in the night, when his *vieille* was asleep, he slipped out of bed and took the book from the inner pocket of his blouse, and passed his fingers over the crisp paper of the notes. After all, he need not be in such a devil of a hurry to return it. If he could have done so that first evening—well and good; but now—anyhow—it did not press so much as all that.

But the next evening his *vieille* came home with some exciting gossip. Marthe Coussins, the policeman's wife, had told her a pocket-book had been lost in the park the day of the Playing of the Fountains. It contained a fabulous sum. The police had been instructed to offer a reward. Now, if *père* had only had the luck to find it in his sweepings—but there—*père* never found a windfall like that!

'Oh, *mère*, *père* found a thimble last summer,' interposed Babette.

'*Ah, ça.* . . . You speak of a thimble, when I tell you of a fortune!'

'Don't tease *père*, little *mère*. See then how tired he looks. He is not well to-day.'

Meanwhile Bougros's conscience had begun to smoulder. For day by day the pocket-book was scorching a wider hole in it. His wife's words fanned the flame. And he felt that Babette's loving and observant young eyes had detected the glow.

The windfall, at first a legitimate source of secret joy, had gradually become a thorn in his side, pricking him damnably. But each day it seemed more difficult to get rid of the cursed thing. And each day he dreaded questions from those *canaille*, the police. He felt they would be sure to come to him—to him, the park-sweeper of such long standing.

Daily he grew paler and more shaky. His women were sorely troubled, and wondered what was wrong.

And at last, on the fifth day, he could bear the horror of his guilty burden no longer. His poor crooked legs trembled and hardly carried him. His meals came amiss. His black cigars seemed his only solace.

Then, suddenly, there flashed upon him a way to dispose of his incubus!

Later that morning, when at work near a shrubbery, he stood up and rested on his broom. He glanced round to make certain that no one observed him. Then, taking from his blouse the hateful cause of his heart-pangs, he threw it on the ground, under the shrubs, and began sweeping again. In a minute or two, however, his broom dragged the hidden object forward to the grass.

'*Tiens!* a pocket-book!' he said aloud; 'and an elegant one. What smart brown leather—what grand gold letters!'

He bent and picked it up. He acted his part gravely, as if every tree and bush near at hand—a great audience—listened intently. He examined the contents.

'Aha, this, then, is the famous pocket-book! Here is the fabulous sum lost on the day of the Grandes Eaux! And it is I—I—Bougros—who have found it. What will the *vieille* say to that? But this is my concern—*nom d'un chien!* No police shall have a hand in this. I, Bougros, have found it. I, Bougros, will restore it, *parbleu!*'

Having played out his quaint little comedy to satisfy himself, and having accomplished his work, he went home earlier than usual that evening.

'*Comment*—thou? So soon returned? Art thou, then, ill?' his wife inquired.

'Ill? *Ma foi!* no.' His gloom, indeed, had dropped from him. He felt quite buoyant again. 'But, see then, *mère*, I have had a find;' and he told his tale.

Madame Bougros was for placing the whole weighty matter in the hands of the police. Had not Marthe Coussins said there would be a reward? And was not that enough for him?

'*Juste ciel*, Bougros!' she entreated, 'do not mix thyself with the affair. . . . The man must be stitched with money, to be able to lose as much as that! It is neither healthy nor safe. Let the police handle it, if they dare! Believe me, it is some trap the Devil has laid for thee. May the saints defend thee from falling into it!'

'But no, *mère*,' he answered her; 'it has been dropped by pure mischance. The meat of one is the poison of another, *vois-tu*. As to the police—it would not be just to saddle them with this responsibility. I, Bougros, will charge myself with it, at once, after supper.'

And just then Babette came in, so they put the thing to her. Her verdict clinched it.

'*Père* has reason. *Voyons donc*, let us be practical, *petite mère*. He has had the luck. Why, then, should he not restore the *porte-feuille* and receive his recompense himself?

He can have a cosy waistcoat for the winter, and you, *petite mère*, will get the new hassock you desire, and a muff to keep your hands warm.'

Madame Bougros shook her head dubiously. Even the visionary muff did not win her approval of Bougros's project. 'It is the Devil's own trick,' she repeated.

Babette walked to the tram with her father.

'And you, my *fillette*,' he asked her, 'if I gain my recompense, well understood, what are you to have?'

'Ah, as for me, I will have a good big kiss—like this.' She took his face between her sun palms and kissed his brown, wrinkled cheeks. 'There is nothing I desire but the money for my apprentice-fee. And that does not get itself in the twinkle of an eye, *ma foi!*'

IV.

The clustered lights were blazing in the Place de la Concorde when Bougros arrived. Their glare made him blink.

Each time he had come from Versailles to Paris the vastness of the city had seemed to overpower him. Yet now he was less impressed by it. He could think of nothing but the disturbing load he carried, and longed to be rid of.

The arched line of the Rue de Rivoli, vanishing into the gloom, appeared to him interminable. On his right, the bulked mass of the Louvre Museum, showing dusky-purple against the evening sky, cheered him. It reminded him of Versailles.

He consulted a *sergent-de-ville*, and was told the number of the omnibus that would land him at the Hippodrome. He took his ticket, and, in due course, was set down at his goal.

A queue of people were filing slowly into the huge building. Outside, bills bore the name 'Glou-glou' in enormous letters. Gigantic posters showed the huge face of a clown with one eye closed and pursed-up lips.

Bougros fought bewilderment. He had taken the precaution to get one of the envelopes out of the pocket-book. He went up to a smart *ouvreuse* with a packet of programmes under her arm, and showing her the address, asked if he could see that gentleman.

She looked him up and down.

'*Sais pas. . . .* At this moment, you understand—*difficile*.'

'It is very urgent,' pleaded Bougros.

'Ah—that may well be. But at this hour he sees no one. In any case, you must inform yourself at the stage-door—third on the left.' Seeing his crestfallen face, she called over her shoulder to some one invisible within, 'Glou-glou—has he arrived?'

'Twenty minutes ago.'

Bougros hesitated.

'But, *pardon*, madame, you deceive yourself. It is Monsieur Gaston Sucque that I seek.'

'*Certes, oui.* He has arrived. Third door on the left.'

She turned away. The old chap was boresome in the end. She had other fish to fry.

Bougros, confused, found the stage-door, and stated his case to a young man seated behind a plank table. Shrugging square shoulders, the youth replied, 'Don't think he will see you—but—*montez toujours*—go up. You will then know.'

Bougros, by now very nervous, started on his journey. The steep staircase soared higher and higher. His heart fluttered as his bowed legs climbed each step.

Above he saw two men standing by a half-opened door. One was stout, dark, close shaved—Miraso, in fact. Bougros advanced to him.

'M-Monsieur Gaston Sucque?' he ventured with trepidation.

Miraso stared at him. '*Che cosa?* But no, monsieur. Monsieur Sucque—*tiens, le voici*—here he is.'

The door opened wider, and in its embrasure, to Bougros's amazement, stood revealed the face and figure of the clown on the posters outside.

'What is it? In the name of a thousand devils, then, tell me! Some one asks for me? They should not have permitted him to ascend—*allons.*'

'*Pardon, monsieur; mille pardons,*' stammered Bougros. He was almost as pale as the man before him, if from another cause.

'What do you want?' Glou-glou demanded.

'Monsieur—if you are Monsieur Gaston Sucque'——

'But certainly that I am Gaston Sucque! *Eh bien?* Say quickly.'

'Then it is your pocket-book that I bring back to you.'

'My pocket-book!'

Courage returned to Bougros. '*Dame, oui.* I am park-sweeper at Versailles. I found it this morning. Under the bushes of the shrubbery to the north of the Neptune fountain. But I dared not entrust a fortune so immense to any one. As to the police'—he repeated his formula—'I am sure monsieur must agree it would not have been just to have placed so great a responsibility on them. I preferred to deliver it to monsieur myself. *Bien sûr*—I did not know monsieur was—was—thus occupied.'

Glou-glou's face crinkled into a thousand white ridges. A huge laugh burst from his crimson lips.

'My pocket-book! That is a good joke, indeed. You are an honest fellow. *Bigre*, yes—*tiens*—permit that I embrace you.'

Before Bougros could say '*Zut!*' two black satin-clad arms squeezed him, the starched white ruff scraped his neck, a dozen fervent kisses were pressed upon his cheeks. Then, as suddenly, he was released.

'*Tapez-là*—your hand. You are a *brave*.'

Glou-glou opened the pocket-book, fingered

the notes. All were there. At that moment the call-boy appeared, crying, 'Monsieur Sucque!'

'I come—I come. *Tiens, mon ami,* I promised a recompense. I must at least give you your share.' Taking out one of the notes, he offered it to Bougros.

Bewildered, our friend fell back and stared at him.

'But, monsieur!'

'Not enough?' asked Glou-glou. '*Voyons*—a thousand francs!'

'But, monsieur, it is a fortune! Monsieur cannot have reflected'——

'Come, do not hesitate. *Certes,* it is less than a fourth of the contents, but we've made it up in embraces, *parbleu! Vîlà*—I must go.'

He kissed his finger-tips to his dazed beneficiary and fled.

Bougros turned to Miraso.

'Monsieur—such a sum!' he remonstrated. 'Never in life had I dreamed of it. Does monsieur really think it is just that I accept?'

'*Macchè*—Monsieur Sucque has grand ways. But he means what he says. My advice is that you take the gift in the same spirit. I go to see him play. *Bonsoir, monsieur,*' and Miraso and his friend departed.

v.

In a beatific dream Père Bougros somehow got himself to Versailles.

En route he attracted—had he noticed it—much amused attention. But he noticed nothing. For his soul floated in prophetic and pleasing contemplation round visionary muffs and hassocks and the equipment needful to a dressmaker's apprentice.

At the cottage door his *vieille* exclaimed aghast at the sight of him, '*Mon vieux,* what then hast thou? But it is the measles—for sure it must be the measles! *Hélas!* I knew some harm would follow!'

'It is precisely there, my cabbage, that thou art wrong. For thy muff will follow—and thy hassock—and Babette's fees—but no harm. They are a bagatelle now, after what has happened!'

'Babette, come quickly! Thy father is ill. . . . Art thou then mad, my poor man?'

'But not at all. Guess the recompense. . . . It is a thousand francs!' He flourished the note in her face.

'A thousand francs! . . . *Ciel!* . . . But thy face, Bougros! Thou hast a big fever.'

'Fever? Nonsense!'

'See then.'

She thrust a hand-glass in front of his astonished eyes.

'Fever? Bah!' He laughed. He laughed till the tears came. 'Fever? That is quite simply the print of Monsieur Glou-glou's kisses!'

SONG OF THE 'VOORSLAG.'*

I SPRANG from the hide of the wildebeest,
Dried soft by a hardy hand;
I shrilled through the air by the Lion's Hill,
And I whistled on Blaauwberg strand.
The eland with his sad-eyed mate
Sped on with trembling hoof,
As I drove them forth to the rolling veld,
And up through the Tulbagh Kloof.

My Lords I led through the wild Karoo,
In the burning of the day,
To the salt-bound verge of the bitter pool
I pointed out the way.
I saw the mounds of the dead arise,
And low through the evening's calm
I heard the wail of the stricken wife,
And the roll of the holy psalm.

I led them on to the mystic North,
Full charged with a nation's yeast;
I flung them forth to the river's brim,
And I scattered them West and East.
I screamed midst the thrusting assegais,
I sighed for the father slain;
I heard the cry of the veld-born child,
And the moan of the mother's pain.

Through the plains of torment, the hills of tears,
Through famine and through feast;
Where the children cried with shrinking fear
At the roaring of the beast;
Where rivers dry as dead men's bones
Scored deep the sandy sea;
I urged them on with a shriller note
To fulfil their destiny.

And ever as they onward pressed,
Through paths beset with foes,
By kloof and vlei and barren mount
The white-walled houses rose.
I saw the bloom of the budding grape,
And the building of the dam;
And faintly through the sunset heard
The bleating of the lamb.

I saw the breasts of the heroines where
The stream by Vechtkop runs,
The priceless love of the noble wives
Who charged and primed the guns;
I waved o'er gallant Potgieter,
I saw the gory flood,
And Weenen's tears. Oh! sweet revenge
That stained the Stream of Blood.

My task is o'er. For me no more
Are the cries of pioneers;
The land lies smiling far and near—
I have done with blood and tears;
But ever through the darkness come
The cries of fathers slain,
The fretful wail of the veld-born child,
And the moan of the mother's pain.

E. A. THOMAS.

* *Voorslag* = whiplash. The word is here meant to refer to the thin thong of antelope-hide at the end of the long whip used in South Africa by transport-wagon drivers. The wagons are very large, and are drawn by spans of from ten to sixteen oxen. Similar vehicles were used by the old Dutch *voortrekkers* or pioneers.

PRAIRIE END.

By H. MORTIMER BATTEN, Author of *Habits and Characters of British Wild Animals, Tracks and Tracking*, &c.

I.

THE midday train clanked and panted its way into the little prairie depot of Totem Gee. The midday heat glanced and shimmered and radiated from the row of white railings, from the long white road stretching, straight as an arrow, from the depot to the settlement beyond, from the solitary figure of the cowboy lolling, with his hands tucked under his *chaparejos*, against the solitary tethering-post. So intense was the light that the face of the cowboy, within the shadow of his huge sun-hat, looked like the face of an Indian as he watched, dull-eyed, the arrival of the train.

It was a strangely dull affair, and the cowboy watched it dully. From the sole surviving Pullman-car an old gentleman lowered himself with laborious caution, and with obvious distrust for prairie platforms. He alighted with an air of triumph, smiled genially on the simmering eternity around, took his bulging Gladstone from the nigger porter, then, as though to reassure himself, again read the huge black-and-white notice announcing that this was the stepping-off place for a dozen seemingly important cities, whose names, alas! were known only to those who ride the prairie solitudes.

The cowboy took in the solitary traveller with obvious interest—as well he might, for the old gentleman wore a light fawn overcoat, a soft felt hat to match, and a startlingly festive button-hole. Having again read the notice and smiled his approval, the passenger lifted his Gladstone and drifted towards the solitary tethering-post. He remarked that it was very warm, and the cowboy raised no dispute on that point. In fact, he seemed to clinch the matter by expectorating with astounding velocity, then wiping his mouth with the back of his hand. The old man's face brightened a little as he met the puncher's keen, steady gaze. There was something reassuring in those gray eyes peering from under the shadowy sombrero. He came to the point with a sudden run of enthusiasm. 'Do you happen to know Mr Jack Hanwell?' he inquired. 'And can you tell me how to reach his—er—ranch?'

The cowboy's stare seemed to intensify. Also, he shifted uneasily from one leg to the other. 'I should jus' say I do know Jack Hanwell,' he drawled. 'I guess I've known him quite a while back.'

The old gentleman fairly beamed. He seemed disposed to shake hands, but the cowboy gave him no encouragement. 'Well, I 'm his father!' the new-comer exploded. 'Come all the way from England to see him.'

The cowboy's lips moved. His bronzed face remained expressionless. His eyes shifted and took in the long, gleaming line of railway metals stretching into invisibility. 'What! Jack Hanwell's father?' he echoed. 'You come to see Jack Hanwell?'

The old man nodded assuringly. 'All the way from England,' he repeated with a jaunty air. 'Come to see Jack!'

Again the other turned his head, and sought the vanishing-point of the skyline. He was doing some quick thinking. 'I reckon you 're early, ain't you?' he speculated. Then he added peremptorily, 'Jack ain't expecting you!'

'Well! well!' muttered the old man, putting down his bag and raising it again. 'And I wrote him a full week before I sailed. Anyway, it doesn't matter. Surprises are all the more merry. So'—and he looked the romantic copper-coloured young Hercules up and down—'and you know Jack, do you? But I suppose you all know each other in these wild parts.'

The shadow of a smile curved the puncher's thin lips. 'I guess I know Jack O.K.,' he said slowly. 'You see, we been partners quite a while. My name 's Cross Berry.'

The old man's bottom jaw dropped. 'Well, I never, and upon my soul!' he exclaimed, making no mistake about shaking hands this time. 'Jack's old friend, Mr Berry, about whom he was always writing! Pleased to meet you—pleased indeed!'

The cowboy grinned bashfully, and if it was possible for his face to carry any more crimson pigment, he probably coloured up. 'Now, as regards this yer proposition of yours,' he went on hastily—too hastily—'it 's a bit unfortunate. You see, when I left Jack he was going up-country—I mean, he was sick of a kind of prairie fever'—— Berry drew a long breath.

 [*All Rights Reserved.*]

He was too big to lie properly. He looked inquiringly at Mr Hanwell with a look that would have given the whole show away to a more sophisticated soul. He was trying to circumvent the fact that the aforesaid Jack, at the zenith of *delirium tremens*, had forced him to seek cover in the face of an extraordinarily accurate ·450, shooting ·455, and making the chips fly. He was trying to circumvent several other facts which will become evident as the story proceeds, but most of all he was trying to circumvent the fact that he himself was lying, which was a pastime new to him, and entirely foreign to his nature. 'At least, we kind of reckon it is prairie fever,' he went on. 'Anyway, it's a kind of fever more or less peculiar to the prairie-edges. It ain't serious,' he quickly pursued, seeing the sudden anxiety in the old man's eyes. 'Oh no, Jack ain't seriously ill, but it's a kind of a custom to isolate such cases. That's why I left Jack, and why I'm idling here. And I was thinking, maybe, you'll be at a loose end till Jack's better.'

'Dear, dear!' said the old man, taking out a gold watch at the end of a gold chain and looking at it without seeing the time. 'How far is Jack's—I mean, your—ranch from here?'

'Oh, let me see now,' drawled the six-foot-five of sinuous manhood, again seeking inspiration from the distance. 'I can do it easy in two days' riding alone. With a buggy, sticking to the trails more or less, same as you'd have to travel, it would take five days clear.'

'Dear, dear!' reiterated Jack's father, his faded eyes seeking shelter in the direction of the platform. 'I always understood from Jack that he was almost within hailing distance of the settlement. But, of course,' he added, 'distance has no meaning to you men of the prairies.'

Berry might have replied that at that moment it had a very considerable meaning to him. He might, indeed, have wished the whole world between Jack and his father. 'See here, Mr Hanwell,' he took up the treads suddenly; 'you want to get out of the sun while I hike along and see what's doing in the way of a shake-down for you to-night. I'll come back with a buggy to take you and your baggage. You hang on here while I have time to look around.'

The old man thanked him profusely; and looking round as he mounted his *cayuse*, Cross Berry saw Jack's father still waving to him in a manner which, according to the customs of Berry's own land, was about as absurd as anything one could think of.

II.

Two or three minutes later Cross Berry burst into the saloon of the Smithson House Hotel. A weird assortment of humanity filled the spacious room beyond—humanity bristling and *chaparejoed*, or *chaparejoed* and pomaded. One or two of the inmates looked as though they had permanently taken root there—or, rather, as though they had sprung up there, adapting themselves to the contour of the counter as a Virginia-creeper adapts itself to the more or less vertical surface to which it clings.

'Look here, boys,' Cross blurted out. 'Some one's got to look around and hustle! I reckon it's going to blow every which way of a Sunday before we're through with this show. Young Jack Hanwell's dad's just arrived at the de-po! I tell you he's there now, waiting for me to go back for him with a buggy. Come all the way from England to see Jack, and Jack laying on his back at Prairie End firing through the roof with a ·450! Wait till you see the old man, then you'll realise what we're up against.'

Some one laughed, some one whistled, and several people said, 'Hell!' Again it was suggested that if the old man was anything of Jack's breed—that was, if Jack was a chip of the old block—'Bring the old feller along, and we'll have the biggest, gosh-blanked son of a gun of a beano that ever was on land or sea!'

'He ain't,' Cross Berry asserted with sudden seriousness. 'I tell you, it ain't no laughing matter. The old man's a kind of a cross between a Quaker and an old English solicitor. He ain't all black, nor he ain't all white, nor is he mud-coloured. He's kind of what your dad and mine might have been if he hadn't been what he was. And mark my word—he thinks a whole heap of that boy.' He took a long breath. 'I had to leave Jack with the half-breed to look after him,' he added. 'And this is his third attack since winter!'

There was an awkward silence, culminating in a clinking of glasses. It was broken by one of the figures adapted to the contour of the counter—a short, muscular man, distinguished by the possession of a scar across his face, which cut brow, nose, cheek, and one eye clean in two. Also, the other eye was still black, owing to a slight difference of opinion with that bright youth, Jack Hanwell, just before the said Jack again took to his bunk to sleep it off. This man was Torbit Wells, who was reputed to have murdered a judge. 'Wall,' drawled Torbit, 'I reckon it's up to you, Cross, to break the news to the old feller. It ain't our show, anyway.'

'Not on your life!' cried Cross Berry. 'I've already told lies enough to make you green with envy! I've told him the cabin is five days out, so as to give us time to look around. Half you boys are at a loose end, and can afford to lend a hand. I'll have to drive the old fellow round for five days, while you get Jack sobered up and everything ship-shape. And, look here—Jack's suffering from a kind of prairie fever, which was why I had to come away. Not a word about my beating it because I'd have got a hole blown in me the size of a walnut if I hadn't!'

Now here was the making of a 'show,' and

nothing on earth appeals to the men of the prairies like a gigantic bluff, especially when the merriment of the proceedings is backed by a sentiment which appeals to their sense of individual virtue. The only trouble is that their sense of humour and thoroughness is apt to overstep their sound judgment; they are apt to overdo it on such occasions. The company declared themselves all in with Cross Berry's scheme—every one but Torbit Wells, who reckoned the whole business a piece of sentimental folly. 'Why not tell the old man, and have done with it?' he demanded. But no one took the least notice of him; he was spoiling sport. Feeling general sympathy against him, Torbit ordered another drink, and drank it in sulky silence.

'I 'll have to leave you boys to see the show through,' Cross wound up finally. 'He ain't to know no different but what Jack 's got prairie fever. Now I 'll go along and fetch him, and mind you plum him up stiff.'

The 'plumming up stiff' process was a matter after their own hearts, and they discussed it with spirit, till Torbit Wells cut up rough, swore that he 'd tell the old fellow the simple truth, and condemned them as a lot of fool-hearted children. In the interim Cross, strolling round the back, found a buggy with *cayuse* harnessed, and helped himself to it. Unfortunately it was Torbit's buggy; unfortunately, also, the seat-box was packed with returned empties, which let forth a frivolous rattle as Cross drove off. Torbit issued from the doors of the Smithson House just in time to see the equipage shuffling off towards the depot—to see Cross hurling the empty bottles overboard, as one heaves ballast, till a train of empty bottles littered the way to the station. Torbit yelled, 'Hi!' Then a very human twinkle came into his deep-set brown eyes; and when, ten minutes later, Cross returned with Mr Hanwell, Torbit was one of the first to extend a cordial welcome. 'We 're all real glad to meet Jack's father,' said Torbit, 'and I guess Jack will be in good shape again by the time you get to him.' That was just the way with Torbit Wells—you never knew where you had him.

Jack's father was a simple-minded English gentleman, of the distinctly rural and slightly Puritan type. Though simple-minded, there was something about him that commanded respect—probably his genuinely sympathetic disposition, backed by the fact that his watch-chain and watch were obviously the best procurable. He shook hands with them all, one by one, looking each man straight in the eyes, while each endeavoured to explain in mere human words how *dear* Jack was to them all, and how they regretted his indisposition at such a time.

III.

After a little while Cross Berry excused himself from the festive gathering on the ground that he had to make preparations for the long return trip; and a minute or so later a single horseman was to be seen progressing at full gallop into the foothills, towards the cloud-like barrier of buttes. Cross reached the cabin where he and Jack Hanwell had lived together for so long in well under the hour. The cabin and outhouses nestled under the buttressed slopes of Prairie End Mountain, sheltered from the gales by almost perpendicular uplands, where, boulder upon boulder, the heights swept up into the clouds. It was a wonderful little corner of God's earth, but this evening a sense of tragedy seemed to hang over the whole pine-crested, boulder-strewn slopes.

Cross Berry found the half-breed whom he had left in charge seated brooding on the veranda-step, sick of the sorry task fate had allotted him. Perhaps he had loved the fair-haired boy within, now a hopeless derelict, for whom there was clearly no place in all the human order of things. The awful pathos of the thing struck Cross Berry for the first time as he entered the cabin. All his contempt and chagrin were gone. He had known Jack Hanwell only as a drifting son of the prairies, a delightful boy when sober, a fighting maniac when drunk—a boy whom no one accepted with any degree of seriousness. He had never pictured Jack as a boy with a father. Now that he saw him lying there in his bunk, his white face horribly conspicuous among the shadows; saw the betraying disorder all around, even to the trailing blanket, under a corner of which the deadly black revolver lay on the floor, a lump rose in his throat for the partner he had loved. He stole up silently, took up the revolver, emptied it with nimble fingers, then heaved it through the open door.

Next he went over to Jack's untouched bundle of mail, selected a letter from the rest, opened it, and glanced quickly through its contents. Yes, it was from the old man—an enthusiastic, happy letter, saying that the long-projected visit was at length to take place.

Cross Berry strode over to the bunk, and clutched Jack's wrist. In his hand he still held the letter, full of the joyous anticipations of a proud father. 'Jack,' said Berry quietly. 'I say, Jack, wake up a minute and listen what I 've got to tell you.'

Jack Hanwell looked round with alert, hardly human eyes. It was not a pleasant look, for there are times when a man's best friend appears to his distorted mind as his worst enemy. 'What d'you want with me?' muttered Jack Hanwell. 'Leave me alone! No one asked you to touch me! Leave me'——

'You got to pull yourself together and listen, Jack,' said Berry, almost savagely. 'I got something to tell you that you want to hear—something all-fired important. Your ol' dad 's here—come all the way from England to see you! He 's here now, at Totem Gee, waiting to come along!

Your ol' dad—d' you hear me? Waiting to see you, and we ain't going to let him know you been drunk! Here 's his letter.'

Jack's long fingers closed upon it, but his hand fell back to the blanket, the letter unread.

'Me drunk!' he muttered thickly. 'You make me out drunk! I'll get plain with you for your skunk tricks'——

'That 's jus' it, Jack. You ain't been drunk at all. You 've had prairie fever—that I 'm dead sure of, whatever the rest think. That 's what I told your old man—that 's what *you* got to tell him. Plain prairie fever! Do you get me, Jack? He 's waiting at Totem Gee to see you—just dying to see you; and he believes you 're straight and decent. You got to sober up, and the boys are coming along to lend you a hand, and I 'm going to entertain the ol' gentleman till you 're O.K. again.'

Jack Hanwell sat up suddenly, a new light in his eyes. He was staring fixedly into the gloom of the cabin. 'Yes—yes, I get you!' he cried. 'My old dad 's coming to see me—coming—— Look—there he is—his face shining—walking through the pine-trees—my old dad—coming to see me—look—*look!*'

He covered his eyes and sank back sobbing; while Cross turned away, a sacred name on his lips. It was neither a blasphemy nor a prayer, but it bore something of the unspeakable pity of it all. 'They 'll have to keep on telling him every day—every hour, till he gets it,' Cross said aloud; then he left the cabin, and rode back towards Totem Gee. And as he rode it occurred to him that his partner was going out—going out towards the unsurveyed.

IV.

Berry arrived at the Smithson House soon after sundown, to find that a banquet in the old man's honour was taking place—quite the dryest banquet Totem Gee had known. Berry appeared radiant. He burst in upon them with the news that he 'd 'jus' met an Injun pulling in from Prairie End way, and he told me Jack 's no end better, and will be more or less O.K. by the time we get there.' Cheers followed, and the evening wound up with speeches, including quite a religious effort from Torbit Wells; nor was it till Mr Hanwell was about to get into bed that he discovered that his watch and chain were missing.

Mr Hanwell did not think it seemly to mention this incident just for the present, and bright and early next morning Berry was ready with the buggy. He had planned out quite a nice little scenic tour for the next five days. They were to head out for the Fox Range, stay overnight with Joe Loam, proceed *viâ* Big Horn Pass and see the Salt Lick, cross the divide into Fox Range again and camp one night within a mile of the Salt Lick, only the other side of it; circle south, stay with Bill Elwood, go by the old tote-road just out of sight of the Totem Gee grain-elevators, and so northward again to Prairie End.

From the outset Berry's passenger was carried away by the magnificent vastness of the scenery, but nevertheless Berry soon found his lying abilities taxed to the utmost. The erratic movements of the sun he dismissed as being partly due to 'hoptical allusion,' peculiar to a 'mountainous climate,' combined with the fact that 'you have to circle round every hill in this yar country, 'cause you can't drive over the top of it.' He would probably have broken down but that the moral (or immoral) support of Joe Loam was so soon forthcoming, for Joe recognised himself a star actor in the 'show,' and withal was notorious as the biggest liar south of Mackenzie River—'which is going some!' Joe greeted them with two kinds of venison, caribou-tongue, and beaver-meat, all of which was, by the law of the land, much out of season, and when he set off on the second day Berry found himself physically unable to speak the truth. By the end of the third day he felt himself to be an incurable liar for life; and when he found that Bill Elwood had gone up-country, that Bill Elwood's brother was at Bill's cabin to meet them, his brain positively refused to accept the established fact that Bill Elwood, to the best of Bill's and every one else's knowledge, never had a brother, and that this fat impostor who called himself Harry Elwood was no other than Percy Smith, the cook from the Smithson House.

At Prairie End things were progressing favourably under the magic guidance of Torbit Wells. Why Torbit had revised his views no one knew, except that during the banquet every one had noticed that Torbit took a distinct fancy to the old man. That Torbit was genuine there was no doubt, and every one bowed to his superior judgment. All picture post-cards were removed from the walls, and their places filled with religious texts and calendars, till the whole place fairly reeked self-righteous nonconformity. By dint of pick, shovel, and a tip-cart the huge dump of empty bottles by the door was conveyed to the creek, and there left to soak in a stream of sobriety. Several black-and-white hens appeared mysteriously about the threshold, and it mattered not that their début at Prairie End coincided with the sudden departure of the minister's black-and-white hens at Totem Gee. As Torbit pointed out, 'There's nothing like a few chuck-ens for making a place look homely.'

Jack was a more difficult proposition. His progress was slow, and on the fourth day Torbit shook his head. He called the others outside, and in the great gray loneliness they held their last committee meeting. They knew that for once Torbit was deadly serious and in deadly earnest.

'Boys,' he said, 'I reckon I know what I 'm looking at when I see what 's before me, and I reckon I know when a man 's going home at the end of the day. Ain't I seen other men go

'ome, same as I seen Judge Blarney when I blowed a hole in him the size of a cocoa-nut? It makes me kind of sick to think of that old gentleman, getting here in time for the funeral, and us doin' nothin' but keeping up the hoax, same as what we 've been doing all along. We 'll have to keep it up, that's a cinch—'cause'—his eyes sought the ground; he kicked up a baby cactus by its roots—'cause there ain't no other way.' Again he paused, and dashed his hand across his mouth; or was it across his eyes? His gaze sought the far-off distance, 'It ain't as though he 's a young man,' he went on, with a strange catch in his voice, 'and I reckon I know human nature best of any of you. He 's come out here looking for something—for everything he 's got to look for! He 's expecting to find a goldfield, and he 's goin' to find a wash-out! He 's an old man, I say, and there 's one thing we can't do for him—we can't save his boy!'

V.

Next day the buggy, with a much-bewildered *cayuse* between the shafts, hove in view, and the old man in the passenger's seat gazed with wonder at the log-cabin nestling beneath the eternal uplands of Prairie End. It looked like the nest of a bird—a Bird of Paradise, perhaps—sheltered from the gales, caressed by the sunlight, endlessly peaceful and lovely against the background of nature's buttresses. The pine-trees shone like fairy castles; the creek was a pathway of purest silver; the emerald slopes bore the soft radiance of velvet of the finest texture. Black-and-white hens strayed in the sunshine; a silvery bucket, set out to sweeten, shone at the threshold—for, as Torbit said, there's nothing like a bucket for making a place look homely. And there at the threshold, his sleeves rolled back from liberally whiskered biceps, stood Torbit himself, a smile as radiant as the day on his scarred and twisted countenance.

'Got here before you,' he cried triumphantly. 'Rode hard by the straight-trail, and got here a whole day before you.'

The old man said nothing, but he seemed to have become very doddery as he descended from the buggy. His old gray head was bared to the skies as he ascended the stony footpath to the door, stooping a little, and the two strong men looked on with smiles that were frozen to their lips.

When he was gone Torbit touched Berry's hand. 'The boy 's dying,' he said quietly.

Berry made no immediate answer, but the elder man read the unspoken inquiry in his eyes—'What then?'

'Then,' Torbit pursued—'then I calculate the old man won't be long. I know human nature, don't I, Cross?'

'You sure do, Torbit,' was all Berry said.

Mr Hanwell stood at the doorway of the cabin, looking at his son. The faint light of the mountain-side lit up the neat, simply furnished room with a strange, soft radiance, and the face of Jack Hanwell was wonderfully peaceful. It was the face of a British schoolboy, for in the soft glimmer the tell-tale finger-prints that the world had left were softened out of existence.

The old man closed the door behind him, and Jack looked up. Then two white hands groped from under the blanket, shaking a little as they were raised to greet the bent figure at the door. 'Dad! My old dad! Oh, but I'm glad to see you!'

The old man was at his side, and for a long time nothing further passed between them.

'You 've been very bad, Jack, boy. I had no idea'——

'Yes, dad. No great guns, but I 'll be O.K. now soon. You 've been a long while coming, dad.'

'Five days on the trail, Jack! Five days of the most wonderful scenery I ever imagined!'

'Five days? Oh yes, of course. It 's a wonderful trip.'

'This little homestead of yours is most wonderful of all,' said the old man.

Jack laughed. 'We built it all ourselves—Cross and I. It 's been our home all along.'

The old man's eyes were shining again. The fear and dread had left them. 'A wonderful life,' he was saying. 'A man's life in a country for men. I have often thought I would just like to end my days in a place like this.'

'Sure, dad, and that 's what you 're going to do. We won't part again now. Wait till I can show you the range—the endless miles of prairie, pink in the sunlight—the dawn coming across the cool water—running water—the pine-trees—the scent of balsam—the dawn, dad, creeping up, up, and the new day coming on. I guess you don't know, dad'—— For Jack himself was drawing very near the dawn.

VI.

Three days later a group of men stood round a hole in the ground at Prairie End, waiting for some one to speak—some one who knew something about the burial service. But no one knew anything about it, so they stood in silence.

They were young men mostly—save for the one at the foot of the grave, who was dressed in city clothing. The hole was filled with flowers—white flowers, red flowers, which sent forth their perfume on the prairie air, seeming to suggest life—new life—life that was dawning in all its virgin purity, endlessly sweet and tender. They stood in silence, I say, and the breeze toyed with their rugged clothing, fluttered through their gay *bandannas*, ruffled the long hair about their bronzed foreheads.

At length he who had been Jack's partner spoke. His voice was husky. 'Boys,' he said, 'when a man comes to the end of the trail, and is kind of sick o' travelling, what does he look

for? Why, a comfortable place to rest! And so our Jack has come to the end of the trail, and we've laid him here to rest—here where the wind passes every morning and evening—here by the home he and I built together. He was my partner—eight years—my partner—but now he's gone—I ain't going to—kick at my breeching—'cause'—— Cross Berry stopped short, vigorously thrusting the end of his necker into his mouth.

'Because'—the old man in city clothing took up the thread—'because he lived straight and clean. Yes, boys'—he looked round at them, smiling—'straight and clean!' he said. 'A man's life in a country for men. He was your friend—he was my son—but, like his partner, I ain't going to—kick at my breeches—'cause God doesn't take a man till he's ready to go. And now, boys, I thank you for your kindness to him and to me, and for these beautiful flowers—and—I think, Cross—we'd better be going—if you'll be so good—as to harness—the buggy.'

And the little procession trailed away, and there was but one of them who held his handkerchief to his eyes—a large, blue handkerchief. But perhaps the eyes of the others were a little misty, for later dispute arose as to whether it was Torbit's handkerchief or his nose, which was just as blue as his handkerchief. Anyway, it was Torbit who supplied the flowers — purchased at the price of a gold watch and chain.

THE STATELY HOMES OF ENGLAND.

PART II.

THE passion for stateliness in residences not infrequently overreaches itself. One of the classical instances of this is the case of Eastbury, the gigantic mansion in the neighbourhood of Blandford, Dorsetshire, built by George Dodington, celebrated in the eighteenth century as a place-hunting politician, and notorious as a Lord of the Admiralty who achieved riches out of the public purse. It was actually begun by his uncle, but completed by himself. Like many another extremely wealthy personage of that time, he posed as a patron of literature and the arts, and maintained at Eastbury tame poets, just as Lady Hertford did at the same period in the great country mansion at Marlborough, which afterwards became the 'Castle' inn, the most magnificent hostelry in England, now forming the older part of Marlborough College.

Dodington became Lord Melcombe, and posed as a Mæcenas until his death in 1762. His great mansion then went to Earl Temple, who, unable to afford the expense of residing in it, offered—and offered in vain—an income of £200 a year and occupation rent-free to any one who would reside at Eastbury and keep it in repair. As this bait failed, the great house was dismantled and demolished piecemeal in 1795. To-day only one wing remains to vouch for its former grandeur.

The great and beautiful residence of Audley End, near Saffron Walden, is distinctly a 'stately home.' Now a seat of Lord Braybrooke, but in recent years leased to Lord Howard de Walden, it was built in a vastly spacious and costly style by that Lord Thomas Howard who so signally helped to destroy the Spanish Armada, and was made Lord High Treasurer and created successively Baron Howard de Walden and Earl of Suffolk. Large though it is now, Audley End to-day is only a portion of the original house. In 1721, and again in 1749, great ranges of it were taken down by the then owners, who were unable to bear the enormous expense of maintaining so huge a place. The building and the furnishing were said to have cost the Lord Treasurer not less than £200,000. He began the works in 1603, and not until thirteen years later were they completed. Well might James the First, visiting that rising palace, declare, with acid meaning, that 'it was too much for a king, though it might do very well for a Lord Treasurer.' It was a belief not ill-founded that the treasury-chests of the nation had been laid under contribution for the benefit of my lord's building extravagances. His wife, too, was credited, in public opinion, with receiving bribes from the Constable of Castile, and the saying thus arose that Audley End was 'built with Spanish gold.' Pepys, who in 1669 visited the house, describes it, and how 'the housekeeper took us into the cellar, where we drank most admirable drink, a health to the king. Here I played on my flageolette, there being an excellent echo.'

Not even one wing, nor indeed one stone, is left to tell us what the celebrated mansion of Canons was like. Only old prints, and not very satisfactory ones, tell us of the magnificence of the 'princely Chandos' who built it from the wealth he had secured in his shameless and wholesale peculations as Paymaster of the Forces. In that position he confused, as recipient of those payments, the forces and himself, to the extent of several millions sterling. He was merely 'Mr Brydges' at the time. Even in the age of Queen Anne, when such things were commonplaces, the disappearance of thirty-five millions startled official circles, and a committee of inquiry held an inquest in the matter. 'Mr Brydges,' says a historian of that age, 'accounted for all the money that had passed through his hands, excepting three millions.'

This notable exception accounts for the building of Canons, near Edgware, which was begun shortly after his succeeding to the title of Baron Chandos, on the death of his father in 1714. He was then successively created Viscount Wilton and Earl of Carnarvon, and in 1719 was advanced to the dignity of Duke of Chandos. The magnificent audacity of his idea is worth recalling. He was, he thought, founding a family, and he intended that family to be properly housed. The walls of Canons were twelve feet thick. The finest craftsmen decorated the interior; the locks and hinges to the doors of the state-apartments were of silver; the ceilings were painted by the foremost artists of the day. His palace cost half-a-million sterling; and his ideas did not end there, for he thought to build a town-house in London with a ten-mile drive between it and Canons. The town-house never came into being, but the two extremely fine mansions on the north side of Cavendish Square are supposed to have been intended as porter's lodges to it.

The duke combined the utmost magnificence with the most exacting parsimony. He never gave more than sixpence; more usually twopence, and not often that. Upon Pope, writing his *Moral Essays*, descended the spirit of prophecy in the lines on 'Timon's Villa,' generally understood to be intended for Canons:

> Another age shall see the golden ear
> Embrown the slope and nod on the parterre,
> Deep harvests bury all his pride has plann'd,
> And laughing Ceres reassume the land.

No prophecy ever was more swiftly or more completely fulfilled. Canons, begun in 1715, was demolished in 1747, and what had cost half-a-million to build was sold in materials for but £11,000. The 'princely duke' had died in 1744, most of his ill-gotten wealth dissipated in the burst bubble of the South Sea speculation. His line came to an end with the third duke. In the Chandos chapel of Whitchurch church is his monument, intended to be splendid, but really achieving a splendid absurdity. There he stands, in white marble, life-size or larger, in wig and that apology for a costume, the dress of a Roman general, looking arrogant; while two of his three wives kneel humbly to him, obviously their lord and master.

Canons thus lasted thirty years. Little more than twice that length of time saw the building of Trentham, in 1850, and its demolition in 1912. That 'lordly pleasure-house,' created by the architect Sir Charles Barry for the Duke of Sutherland, was a vast enlargement in the Italian Renaissance style of an old house of the Leveson-Gowers in Staffordshire, beside the banks of the river Trent, in the Potteries district. The Potteries have grown steadily more prosperous and more dirty, and Stoke-on-Trent has spread out and absorbed the five towns. A ribald rhyme describes those five towns, now amalgamated in one:

> Up in the wilds of Stafford spreads a horrid cloud of smoke,
> Its fearful name is Fenton — Longton — Hanley—Burslem—Stoke.

The river became polluted, the air grimy. The Duke of Sutherland offered the place he could no longer live in to the public authorities, but they could not see their way to accept; and nothing remained, therefore, but to sell Trentham for demolition. In September 1912, accordingly, the fittings and the materials were disposed of, at auction, in a three-days' sale. Everything went at extremely low prices, and the central tower, which cost £1000, brought only one bid of £50, at which it was withdrawn. The grand staircase, of Hopton Wood stone and Derbyshire marble, commanded so little as £10. Thus disappeared the mid-Victorian Staffordshire stately seat of Trentham.

Eaton Hall, the gorgeous seat of the Duke of Westminster, outside Chester, may likewise be described, in the words of Pope, as 'a house, and not a dwelling.' The present duke cannot manage to live in that palatial pile built by his grandfather, but divides his residence, when in the country, between a modest house in Eaton Park and one at Saighton. Eaton Hall, designed by the late Alfred Waterhouse, R.A., and built between the years 1867–81, on the site of a mansion in itself very large, but not grand enough for the Marquis of Westminster after he had been created a duke on the recommendation of Mr Gladstone, is said to have cost, from first to last, over £3,000,000. It is the fourth building on this site. Although designed by Waterhouse, it bears a very strong resemblance to Sir Gilbert Scott's practice, and greatly reminds one of his buildings for St Pancras railway-station, including a very similar clock-tower. The traditional 'Hugh Lupus,' from whom the Grosvenors are said to be descended, is a myth; but a heroic equestrian statue of that figment of the imagination, by G. F. Watts, R.A., stands in the courtyard. In the library all the books are sumptuously bound in white. Hall, park, and stables are all show-places, and are to be seen by purchasing tickets. The proceeds are devoted to charities.

The cold, vast magnificence of Sion House, the Duke of Northumberland's suburban seat at Brentford, is another apt specimen of what is possible in the way of unhomely houses. It can scarce be styled a 'residence'; and indeed the late duke preferred to live at his modest house in Albury Park, in Surrey, rather than at either Sion or his mediæval fortress, Alnwick Castle, which, although so stern and grim without, is in the likeness of an Italian palace within, having been thus remodelled by two dukes. The first was that Sir Hugh Smithson who married in 1740 the Percy heiress and assumed the Percy

name, and was created Duke of Northumberland by George III. He was an apothecary. Having become a duke, he desired also to be a Knight of the Garter—that order so admired by Lord Melbourne in Queen Victoria's time, because (as he put it) 'there's no d—d nonsense of merit about it.' To be a K.G. is a ducal privilege not often withheld; and the newly created duke naturally desired this 'most noble order' of chivalry. He accordingly asked the king for it, saying he was the first Percy who had not been created a knight of this premier order. 'You are,' returned the king, 'the first Smithson to ask.'

The second remodelling of Alnwick was the work of Algernon, fourth duke, in 1855.

The Smithson duke was a magnificent person. He it was who in 1762 began the rebuilding of Sion, employing Robert Adam, one of the famous Adam brothers who invented that modification of the classic styles well known by their name. The suburbs long since began creeping out towards this country pleasance, and quite a number of years ago a more than usually outspoken Duchess of Northumberland described Sion as 'an hobbledehoy,' meaning that, just as a youth who is neither a boy nor a man is so called, so is Sion neither town nor country. Incidentally, Sion, which takes its name from an old religious house for nuns, the Daughters of Sion, of the Order of St Bridget, has never proved disastrous to its secular owner, as old Sir Henry Spelman who wrote a *History of Sacrilege* would have us believe to be the penalty of owning sometime Church property. The dispossessed Sion nuns finally, after many years, wandered to Lisbon, by way of Flanders. An Abbey of Sion still existed there a few years ago, and the sisters were solely Englishwomen. It has been recorded that they cherished the idea of their house being some day restored here, by the banks of Thames, and that they still retained the old keys of the lost abbey. Ninety years or more since, the then Duke of Northumberland, travelling in Portugal, called at the abbey, and was told of this fond belief. The nuns even showed him the keys. But he was equal to the occasion, and cynically remarked that the locks had been altered since those days.

Claremont, near the Surrey village of Esher, owes its name to an Earl of Clare who in the eighteenth century greatly extended a small country-house built by Vanbrugh for himself. The earl added largely to the grounds by the simple process of filching from the commoners of Esher a great portion of the common lands. Enclosing them, he created what is now the park, and built a belvedere on a pleasant knoll, which he called 'Clare Mount.' He was succeeded by Clive, the 'heaven-born general,' victor of Plassey, who shortly after 1768 began building the present exceedingly handsome 'Claremont.' Macaulay, writing of it, describes how 'the peasantry of Surrey looked with mysterious horror on the stately house which was rising at Claremont, and whispered that the great wicked lord had ordered the walls to be made so thick in order to keep out the devil, who would one day carry him away bodily.' A good deal of the characteristic Macaulay emphasis and instinct for drama in that; but it is certain that Clive's political enemies painted him in very black colours, and when that great man killed himself in a fit of depression at his house in Berkeley Square, they seemed to some to be justified. The arms of Clive still decorate the pediment of the noble front of Claremont, although it soon passed out of the family. It is a mansion of sad memories. There died the Princess Charlotte, only child of George IV., in 1816. Had she lived she, and not the Princess Victoria, would have been Queen of England. Claremont is now Crown property. Queen Victoria lent it in 1848 to Louis Philippe, king of the French, who, under the *alias* of 'Mr Smith,' fled in terror from his loving subjects, and came to Claremont in extreme haste by post-chaise. The great clumsy boots worn by the post-boy on that historic occasion are yet to be seen in the hall of that old inn, the 'Bear,' at Esher, preserved in a glass case. The fugitive king died here in 1850. Claremont became the residence of Prince Leopold, Duke of Albany, the youngest son of Queen Victoria, on his marriage. He died in 1884. The Duchess of Albany is life-tenant.

The late King Edward VII. was, we need hardly press the point, a man of an exceptionally right understanding. In nothing did he display this more than in his building of Sandringham when Prince of Wales. If any one might be said to require a 'stately home' for the due maintenance of a dignified position, it was he. Upon his marriage and coming of age it was felt that the Prince of Wales should possess a suitable country residence. Many existing seats were suggested and offered, among them that enormous place, Houghton Hall, Norfolk, the old seat of the Walpoles, earls of Orford, which was built, 1722–35, by the great Prime Minister, Sir Robert Walpole. In the customary family-mausoleum style of the time, Houghton was described very aptly as a 'triste, melancholy fine place.' The park was a kind of almost treeless wilderness, in which, it was stated, there were only two forest trees, for whose possession rival colonies of rooks were fighting.

A story very like this was told of the even more sandy, treeless, and barren 'park' of Holkham, not far distant, the seat of the famous Coke of Holkham, Earl of Leicester. There, it was wittily said, was one blade of grass for which two rabbits contended.

Houghton Hall is some four hundred and fifty feet in length. In Sir Robert Walpole's

time it was the scene of great entertainments; but that state of affairs did not last long; and for very many years no one has been able to afford to live in this great house. Houghton was offered to the Duke of Wellington when the nation proposed to buy an estate for him; but, perhaps with the example of Blenheim in mind, he refused it, and acquired instead the much more modest Strathfieldsaye.

The Prince of Wales declined Houghton, and selected the neighbouring Sandringham estate, which was purchased from the Hon. Spencer Cowper's trustees for £220,000, in 1861. The area is seven thousand acres. Here he built for himself a residence which is not 'stately,' but exceedingly pleasant, in red brick and in the domestic Elizabethan style, promising comfort and a home. And there it stands looking typically English; a natural growth, as it were, and owing nothing to alien influence. Is not this entirely typical of that great sovereign?

THE END.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER V.—*continued.*

V.

AS the three of them huddled to the earth under cover, there came a sparkle of light from the mound of rock ahead, and a bullet droned above them. At the flash in the gray morning air, the driver darted his hand upwards and fired every chamber of the five-shot revolver he carried. At once above his head the protecting rock splintered, and on a rock behind a bullet starred.

'Better not do that again,' said Clement, hugging cover, as he had learnt to do in France and on the hunting-trail.

'Shootin' *me* up!' breathed the driver as he reloaded. 'I'll teach him.'

'You won't that way,' said Clement. 'Not without damage to yourself. That must be the half-breed Siwash planted there to hold us away from Cobalt as long as possible. He's probably up to all the tricks. We sha'n't be able to rush him; we 've got to get him by guile.'

'I don't care about guile so long as I can shoot him up.'

Clement, who, in the broadening pallor of light, had been studying the ground, both about them and about the rock on which their assailant was entrenched, said crisply, 'You shall. Stick your revolver round the farther end of your rock—no more than your pistol, if you value your arm—and when you've fired, whip it in sharp. No, don't trouble to aim at anything. Ready? Now fire.'

The driver's revolver spoke. Almost at once there was an answering sparkle from the rock-cliff, and the rock against which the revolver rested chipped into flecks of flying particles.

'Close up,' said the driver. 'He 's getting his range pretty.'

'He is,' said Clement, who had asked the driver to fire so that he might study their opponent's position. 'Lucky for us his first shots were mere sighters, with the distance wrongly gauged. But now he 's got a marked range, and he 'll get anything of us that shows. Also, he moves after every shot. We sha'n't get him by pot-shooting. We 've got to tackle this fellow with some of his own cunning. And we 've got to do it quickly, before the light gets too good.'

Again he gave the ground about them a sharp survey, his mind, accustomed in the old days to trench-warfare, sizing up the situation quickly and accurately.

'Will you two crawl over to the left there? And don't forget cover is life. I want you to get behind those rocks over there—you behind the big one, driver; you behind the smaller, Gatineau. When I give you the word, I want one of you to blaze at him and draw his fire. When he fires back, I want you both to loose off. —Can you fire with the left hand, Gatineau? Well, do, alternating your shots. I want that lad to be convinced that he has three men pinned here.'

'And you 're going to flank him?' said Gatineau.

'I 'm going to try to do that.'

'Not a very safe job with a slim feller like that,' said the driver.

'I had some practice at it in France. Great training-ground, France. Also, I've done quite a lot of stalking. Anyhow, it 's our only chance if we 're not to remain here all day.'

The two men crawled across to their stations without drawing fire, both the light and their own carefulness favouring them. Then Gatineau fired at the rock. The shot was immediately answered, and as immediately a very hearty fusillade burst from the two behind their rocks. Clement chuckled at the ardour Gatineau and his companion put into the business. It was a real early morning 'hate' of the Front. Not three men but a file seemed to be in action, to judge from the rattling discharges of the twain.

But though Clement Seadon was grinning, he was also fulfilling his own part of the plan. Directly the firing began and the attention of the man on the rock was occupied with it, he slipped from the rock under which he lay, and began to worm his way in a wide circle to the

right. He had good cover, and he made excellent progress. He was also helped by the clever co operation of his companions. They went one better than instructions. Instead of remaining in one place and firing from that, they worked steadily along the arc to the left, and Siwash—Clement was certain it was Siwash—in swivelling round to follow them, naturally turned his back more and more on Clement.

And the two men did not overdo their part. To have gone too much to the left would have threatened Siwash with encirclement, and thus would have forced him to retreat from the rock-cliff to another vantage-point, to which Clement would have had to follow him. Instead of this, they made their progress slow and limited. But they drew fire with all manner of tricks. Gatineau bobbed up his hat on the end of his electric torch, getting a bullet through the crown of it, but at the same time convincing Siwash that the party was there. The driver did much the same at the outside edge of a rock, to convince the rogue that the party was working deliberately to the left. When Siwash fired, the two men remained for many minutes in that position, and advertised the fact in the usual way, as though they had become stuck in that place.

Meantime Clement made definite progress round the right flank. The ground was good and rocky, and made for stalking. In about half-an-hour he reached a position from which he could survey the rocky place where the highwayman was, could even see the fellow as he moved stealthily from point to point. It was, as he had thought, Siwash.

Actually, at one time, he had Siwash's legs and thighs at the mercy of his pistol, but though the chances were nine to one on his hitting, he decided not to risk it. If he wounded the fellow he might not put him out, while it would betray the double game they were playing, and so make the enemy more cautious and dangerous. When he fired, he must do so with absolute certainty of putting an end to this pistol-play.

All the same, he had to fire before he was ready. He had worked round to a fairly good position, when he saw no more than the hands of Siwash (the rest was covered) doing a peculiar thing. The hands seemed to be rolling a cigarette. The hands finished rolling the cigarette, and, with the utmost cunning, it was lighted. A broad puff of smoke rose up, and another, immediately drawing a spattering of shots from the men below. Siwash, hidden, puffed for a minute on the cigarette; then the hands appeared again, and Clement watched them cleverly fixing the wet butt of the 'smoke' to the face of a rock. Siwash had calculated the draught well, for the lighted end gave off a thin thread of smoke, which occasionally became a puff, in the now advanced light of the growing day. Directly he had fixed up the cigarette Siwash began to slink away between the rocks. Then Clement fired.

He had to fire. He recognised Siwash's game at once. Siwash meant to hypnotise the men under cover below with that cigarette-smoke. They would keep their eyes fixed on that, and would not notice that the fellow was worming round them. The first intimation of his tactics they would get would be a shot from their exposed flank, and that shot would be aimed to kill. Clement recognised this in a flash, and fired.

He saw Siwash jerk and dive forward out of sight. He thought he had hit, but did not waste time speculating on the matter. He nipped forward very rapidly, keeping well in cover, for, even if you think you have killed a man, it is mere wisdom not to take it for granted until you are certain. He had covered half the distance when he heard a shout, and peeping out from cover, he saw the detective, Gatineau, on the ground where Siwash had fallen and disappeared. Gatineau stood upright, but drew no shot. Clement discarded cover and ran, scrambling over the rocks to join him.

He reached the spot, found Gatineau, but no Siwash. There was blood on the ground, and the trail of it led away from a point on the edge of the rocky outcrop where Siwash must have been hit. Clement was about to ask questions, when, with a loud 'Got it, Steve,' the driver scrambled into sight. The driver had a large automatic in his hand as well as his own revolver.

'Say, you got him pretty,' shouted the driver. 'But where is that bad-man?'

'We saw him go down "smash!" when you fired,' explained the detective. 'He shot right into sight before dropping out of it. As he went down his gun dropped out of his hand, hit that rock there, and went bouncing down to the foot of the outcrop. I guess you hit him powerful. We surmised his teeth were drawn, so I came up here quick to get him if he wasn't done, while the driver went for the gun.'

'An' I got the gun, but you didn't get that bad-man.'

'He must be a pretty sick man, anyhow,' said Gatineau, pointing to the blood. 'He can't be far off.'

They followed the trail. It wormed in and out of the rocks, and against some of them was a smear of blood. Then suddenly, across an open space ringed with rocks, they lost it. Siwash had evidently stanched the flow before he crossed this place. They stared at the rocks, the hard surface of which showed no foot-prints. They could see no sign of movement.

'He might be at any point of the compass there,' said Clement. 'We might hunt all day for him, and not find him. And we don't particularly want to find him.'

'No; the sooner we get to Cobalt the better,' agreed Gatineau. 'And his teeth are drawn, anyhow. We can lodge information at the town, and the police there can deal with him—if he remains hereabouts to be dealt with. We'd better get along.'

They found the trail again, and resumed their tramp; and though they were not interfered with any more, they speculated why it was that Siwash had been dropped from the car, stranded, as they had been, in the wilderness, just to hold them up for an hour or so.

'It's not as if he could have kept us here indefinite,' said the driver.

'Apart from the fact that he might have had the great good luck of killing me,' said Clement, 'an advantage which is the fondest dream of the rogues, for with me out of the way interference with them would slacken off, if it did not come to an end altogether—apart from that satisfying ideal, they want to keep us away from Cobalt as long as they can, to give Miss Reys as long a start as possible.'

'She'll get that anyhow if she leaves by the first train out,' said the driver. 'We wouldn't have got in anyhow until hours after she has left. You couldn't hope to catch her in a run either east or west, unless she stops off somewhere.'

'We could have caught her by wire or telephone at North Bay or Sudbury, either of those junctions,' said Clement. 'We know she must go as far as that, because there is no other line for her to travel on'——

'Unless she goes north,' said Gatineau.

'Unless she goes north to Cochrane,' agreed Clement. 'But even then it is a straight line, and she could not escape us until she got to the junction. When she gets to any of these junctions we lose her, especially those to the south, for she can be swallowed up in two or three cross-sections going south or east or west, and we'll find it difficult to follow her. She'll simply go off into the blue. But if we can get her by wire or telephone before she reaches one of the junctions, asking her to await our arrival, then we can beat Neuburg and his scoundrels.'

'Say, is this Miss Heloise running away from you?' demanded the mystified driver. 'Say, are you'——

'She's not doing it intentionally,' said Clement. 'It's a long story, but the main facts are that we want to prevent her doing something, and Neuburg and his lot are working their hardest to stop us doing it—as you have seen for yourself. So far as Miss Reys is concerned, she doesn't even know we are following her. Neuburg, with the aid of the companion you interviewed, Méduse Smythe, is taking care of that. If we could get in touch with her before they covered up her trail at North Bay or Sudbury'——

'I'm afraid we sha'n't do it,' said Gatineau; and the driver said more finally, 'You *won't* do it.'

They tramped on steadily for two hours before they sighted the first house. This was a mere shack, without telephone, without any of the luxuries at all. An old man was in it, and being Canadian, he made them free of the place. Though he could not provide any sort of conveyance to carry them into Cobalt, he told them that about an hour on they would find a group of homesteads back from the trail, and would be able to get a rig there. He gave them what they were sadly in need of—that is, food and hot coffee—and told them, as they ate and drank, something of the hardships and the pleasures of homesteading in the wilds. He had heard both cars go by in the night, and had heard one return, going as though hell itself was trailing after it.

With the morning well advanced they reached the homesteads, and all of them piled on to a couple of rigs, uncomfortable and jolty vehicles for men tired out by lack of sleep and by the excitements of the night, for there was no means of lying down in them.

Yet they were all that could be obtained, and they served their purpose, and the party reached Cobalt in them ultimately, if wearily. Here they paid off the driver, telling him to send in his bill to Clement Seadon at the Canadian Pacific Offices at Montreal for the haulage and repairs of his bogged car; and this done, they made inquiries at the hotel where Heloise had stayed, and at the railway-depot.

The hotel people could say nothing save that Miss Reys and her companion had left by the first train south, but for what destination they could not say. The people at the depot could say very little more.

Yes, they remembered the two ladies who left by the first train out. They remembered them by the youth and beauty of one—some queen Jane, in their opinion—and the novelty of two highly nurtured females leaving at that hour. And, oh yep! they could tell at once where they had gone. They had gone exactly as far as—North Bay.

North Bay, and no farther. The other woman, not the good-looker, had taken tickets for there.

North Bay! Clement Seadon knew what North Bay signified. North Bay was the place where the trail would be skilfully covered up. From North Bay Heloise would vanish into the vastness of Canada once more. North Bay was the place where Neuburg hoped to throw the pursuit off the scent.

JAN MAYEN REVISITED.

IN August 1919 the Danish inspecting-vessel *Iceland Falcon*, under the command of Captain Bojeson, made an expedition to the rarely visited island of Jan Mayen, in the Northern Arctic, in order to take over a number of buildings which had been presented to the Danish State by an Austrian naturalist, Count Wilchek; and at the same time a series of interesting surveys and meteorological observations were carried out in the vicinity.

The island of Jan Mayen, which has an area of about 150 square miles, lies some 350 miles to the north-east of Iceland. Its formation is purely volcanic, and the north-eastern portion consists of the great volcano Beerenberg (7000 feet), which is completely covered with ice, and from which glaciers descend on every side to the sea. The last eruption took place in 1818; another had occurred in 1732. The smaller or south-western part of the island is connected with the other portion by a low, narrow tongue formed of masses of basaltic lava, in which there are numerous craters and ash-cones. Also, on Egg Island, near by, there are many traces of volcanic activity. A more inhospitable spot than Jan Mayen it would be difficult to imagine; yet the British Government was notified last May that it had been occupied by a Norwegian subject. Besides great numbers of seafowl there are many Arctic foxes, and Polar bears are sometimes found.

Jan Mayen has been investigated several times, although somewhat superficially; and it is visited now and again by Norwegian hunting and whaling vessels, some of which have even wintered there. Surveys have been made on and round the island by various expeditions, but the charting of the waters in the vicinity had been very imperfectly done. In 1882–83 a whole series of international meteorological observations was undertaken in the Arctic regions. The different European states fitted out expeditions for the purpose. Amongst these Denmark sent one to Godthaab, in Greenland, under the command of Captain Ryder, now director of the Meteorological Institute in Copenhagen; and Austro-Hungary despatched an expedition to Jan Mayen under the leadership of an Austrian marine officer, Von Wohlgemuth. It was fitted out by the Count Wilchek referred to above, and at his cost a considerable number of buildings for purposes of observation, dwellings, and storehouses were erected on Jan Mayen. On the departure of the Austrian expedition these were all locked up, and provisions for four men for a year were left behind. These, with the count's permission, were afterwards used by hunting expeditions which wintered on the island. In 1917, however, Count Wilchek offered the whole of the buildings to the Danish State as a gift, in grateful acknowledgment of the assistance which had been given to his expedition by the Danes, and because the neighbouring lands, Iceland and parts of Greenland, were appanages of the Danish Crown. The Danish Government accepted the gift, and after the necessary formalities had been gone through, it was decided to despatch a vessel in the summer of 1919 on a voyage of inspection to Jan Mayen. Accordingly on 2nd August the *Iceland Falcon*, having taken on board a supply of the scientific instruments required, sailed from Seydisfjord, in Iceland, and two days later she reached her objective. The expedition was very successful, owing in great measure to the weather, which was very fine—always excepting the fog, which may be described as a permanent institution round Jan Mayen. Indeed, the Norwegian whalers say that it is as hard to find Jan Mayen as it is to find a needle in a haystack. Sometimes, however, the huge glacier-clad volcano of Beerenberg may be seen at a great distance through the fog. The waters hereabouts are very stormy, and there being practically no safe anchorages, a vessel must always be ready to proceed to sea at any hour of the day or the night. In view of such a possibility, therefore, the men who were landed from the Danish ship as soon as she reached the coast took with them supplies sufficient for five days. While Count Wilchek's buildings were being examined and overhauled, the crew of the ship got shore leave in parties, and when all had had an opportunity of satisfying their curiosity, the *Iceland Falcon* proceeded to sea, and began surveying—a work which was continued without intermission for four days and nights. The temperature of the water was also taken at various depths, plankton investigations were conducted, and, with the object of ascertaining the trend of the currents, a number of well-stoppered bottles were committed to the waves.

The supply of coal did not admit of a longer stay than until the 9th of August, and on that day the vessel left for Iceland, deep-sea soundings being carried out on the voyage.

The Norwegian Sea has a depth which almost rivals that of the Atlantic and Pacific Oceans; in the whole of the central portion it exceeds 1000 fathoms, while to the south-east of Jan Mayen 2000, and off Spitsbergen 2500, fathoms have been found.

Owing presumably to the low temperature of the water, no fish were found; but shoals of herring are said to have been observed in the neighbourhood of the island by previous expeditions.

In March and April large numbers of seals are captured along the edge of the ice to the north and the east of Jan Mayen—as many as 300,000 have been killed there in a season. At that time

many Polar bears are found in the neighbourhood of the rookeries, and are shot at a great distance from land. Later on there is a 'right whale' fishery to the north and the west of Jan Mayen. On the basis of the many important and interesting observations made by the *Iceland Falcon*, an accurate chart can now be drawn of the waters round this remote island.

THE MYSTERY OF THE *WELL MET*.

CHAPTER VI.—A PRISONER.

WHEN, slowly and painfully, his senses returned to him, Hervey saw that it was morning, and that he was lying on deck so wrapped round and about with tightly knotted cords that he resembled more a mummy than a living human being. An additional cord tied round his feet secured him to a ringbolt, and the anguish of pain he endured from the tightness of his bonds and from the thirst that parched his dry lips was so great, he could not hold back a groan.

He heard a step behind, and Wilson came up and stood looking down at him. 'How are you this morning, Mr Drake?' he asked, with that curiously loathsome smile of his. 'Pretty comfortable, I hope?'

Hervey did not answer, but looked at him steadily; whereupon Wilson gave him a careless kick in the ribs and strolled away. A moment or two later Jacques came up with his knife in his hand, and put the edge of it to Hervey's throat as he lay helpless.

'How like you that?' he asked. 'Eh? How like you that?'

Hervey yawned. 'You've no imagination, Jacques,' he said. 'Even when you come at last to the gallows and stand with the rope about your neck, you'll still be nothing but a dull fool.'

Jacques scowled at him, but sheathed his knife and went off, having enjoyed less sport than he had hoped for, since there is little use in trying to frighten a man who can yawn with a knife at his throat. But Hervey guessed that he would have been dead long ago had they not thought that they still needed his services, and it seemed to him that even now he was not altogether helpless.

'Wilson!' he called. 'Wilson, here! I want you.'

Wilson answered the call, though with an air of some surprise, for this peremptory summons from a man so utterly in his power astonished him not a little.

'You called me?' he said. 'Are you tired of life, I wonder?'

'Not at all,' answered Hervey, 'but we may as well understand each other. It may save some inconvenience to us both. I want to tell you my terms.'

'Your—terms?' repeated Wilson, staring at him. 'Do you think you're in a position to make any?'

'I do,' answered Hervey quietly; 'and I fancy you think so, too, or why did you not cut my throat last night? Why, you fool, you know as well as I do that you can no more handle this schooner than a three-year-old child can run a steam-engine. You can't reach Manilla without me. If I get you there, you can't without my help berth her without making such an exhibition that the port authorities would send off a boat to find out what was wrong. And, remember, Manilla isn't Spanish now; it's American. That means you can neither bluff, fool, nor bribe the port authorities. My good fellow, you can save yourself and your precious friends in just one way, and one way only—by making it worth my while to help you. If you want my help, you had better ask my price. If not—well, take your own course, and don't be surprised if it lands you in jail in quick sticks.'

'There's something in what you say,' admitted Wilson. 'We do need your help. But for that you would have died some hours ago. Your help is necessary to us, you say? Agreed. But we may secure it by means other, and possibly less agreeable, than those you call accepting your terms. A little gentle pressure. For example'——

'Try,' said Hervey briefly.

'For example, if we hung you up in the rigging by your thumbs?'

'Try,' said Hervey, as briefly as before.

Wilson stooped down to look at him, and Hervey gazed steadily back into the depths of the dark, evil eyes that searched so closely his own, where there burned the fires of a great resolve.

'There are more ways than one of bringing an obstinate man to his senses,' said Wilson at last, and again that dreadful smile flickered for a moment at the corners of his thin and cruel mouth.

He walked away, leaving Hervey desperate, for it seemed a dark threat lay behind his words. In a very short time he was back, and with him were Lucy Endicott—very lovely, her face pale like that of one newly dead, her small head proud and upright—and Jacques and Sylvestre, one at each side of the girl.

'As you have truly, though perhaps a little boastfully, informed me,' Wilson said slowly, 'we need your assistance, Mr Drake. You say you will give it to us only on your own terms. It is a resolve I am persuaded I could

induce you to reconsider, and the task would afford me much pleasure; but we are pressed for time, and I confess I think that by the time I had brought you to a more reasonable frame of mind you might be so much the worse for wear that your assistance would be of little value. It would save trouble, I dare say, on all sides, if you agree to do what we ask of you. All we require is that you should navigate this ship to Manilla and help us to berth her. Once we are safely in port, you and Miss Endicott and Captain Endicott will promise to remain quietly on board for six hours before attempting to give any alarm, so that we may have sufficient time to seek shelter.'

Hervey hesitated, knowing well that this offer was as false as the man who made it, and that once the schooner was safely moored in Manilla harbour, the last thing these men would do would be to leave him and the Endicotts safe and unharmed to tell their story to the authorities and set all Manilla on the search for them. Yet he did not know but that a refusal might entail worse consequences; and, after all, any delay was so much gain.

'I tell you what I will do,' he said. 'I will do all you say if, when we are outside the harbour, you lower a boat and let Miss Endicott and her father go ashore in it. You would have plenty of time to make your escape before they could give any alarm.'

'I'm afraid that would never do,' Wilson answered. 'You are obstinate, then? Well, we must try another way.—Jacques, hang Miss Endicott up by her thumbs opposite her friend here, and let us see'——

'No, no,' Hervey interrupted hoarsely, knowing he had lost the game. 'I'll do whatever you want me to.'

'Mr Drake,' Lucy said, 'I'm not afraid. Let them do what they like. I can bear it.' And she held out her hands to Jacques.

'No,' muttered Hervey in the same harsh and strained voice that was barely recognisable as his own—'no; we're beat. God help us, for no other can.—I will do what you want,' he added to Wilson, and the perspiration stood on his forehead in little drops and rolled slowly down his cheeks like tears.

'I thought my arguments would soon prove convincing,' remarked Wilson, and again his smile touched his lips and the corners of his mouth, making his evil face more evil still. 'Sylvestre, take Miss Endicott back to her cabin.—Mr Drake, I suppose you had better have something to eat, and I dare say, if we released you, you would be more useful than you are at present. But I fear we cannot afford to give you your full liberty.—Jacques, bring me the handcuffs and that chain and padlock I showed you.'

They released him from the ropes with which he was bound, and gave him food and drink, for clearly it was not their purpose to let him die—just yet; but they secured his wrists with a pair of handcuffs they had found on board, and they also padlocked his ankle to a short length of cable, so that all his movements were hampered and difficult. When they had finished doing this Wilson laughed, and threw the keys of the handcuffs and the padlock overboard.

'Now I think we have you safe, my little man,' he said. 'It might have been better to take this way from the first, but we wanted to be good and kind to you. However, do your best for us now, and you 'll be all right still.'

Hervey did not answer. He knew he was helpless, and must obey whatever commands they gave him. In his fettered condition he could no longer help with the actual work of the ship, but the weather remained favourable, so that there was very little that needed to be done. He was quite able, however, to take charge of the wheel, and they kept him there, except for what intervals were necessary for rest, till noon the next day, when they came in sight of land.

Bitter indeed were Hervey's thoughts as he stood, a helpless captive, at the ship's wheel and did his masters' bidding. Death would have been welcome, but he dared not die and leave Lucy Endicott and her father to the mercy of these human tigers. Yet alive he was little help to them, and hope died in his breast. Still there remained in him a faint and flickering and doubtful faith that alone stood between him and madness. For, when he lifted his eyes to the stainless blue of the perfect sky above, it did not seem to him that He whose work that was would allow such wickedness to be done, or desert in their need those who trusted in Him.

Lucy had not been allowed on deck again, but he believed that so far she and her father were safe, as he had seen both Sylvestre and Drew take food below, and bring back empty dishes.

They were quite close to land now; and about three o'clock in the afternoon a small American gunboat passed them about a mile away, looking very smart and trim, and evidently bound for Manilla.

With what longing eyes did Hervey watch her! How bitter it was to him to see her pass on, power and law and justice incarnate, and know how swiftly and certainly she would have come to their rescue if only he had been able to let her know their dreadful need! She passed on; there were tears in his eyes—tears not for himself, but for Lucy Endicott and her helpless father—as he watched her draw ahead and vanish out of sight.

A few moments later Wilson came up with a chart in his hand, and began to ask questions about their exact position and about the lie of the land. Hervey showed him where they were, and told him they were about ten miles from Manilla, and Wilson nodded thoughtfully.

'That will be enough,' he said. 'We 'll anchor here, and wait till night.'

'What for?' Hervey asked.

'That 's our affair,' answered Wilson. 'You 've only to do what we tell you, unless you are looking for more trouble.'

He went away then, and he and his companions became very busy. They reefed the schooner's sails and brought her to, lowering her anchor. They fetched on deck a large number of packages they seemed to have all ready, and began to prepare the larger of the two boats the schooner carried. Hervey guessed then that they had determined not to risk entering the harbour and facing the questions they might be asked, and that they had determined to abandon the ship and row ashore, taking with them such valuables from cabins and cargo as they conveniently could. The last thing they did when they had finished all their preparations was to come to him and firmly secure to the deck the loose end of the length of cable they had padlocked to his foot, so that he was unable to move more than a few feet in any direction.

'What 's that for?' he asked. 'What are you going to do?'

'That 's asking questions,' Wilson retorted, examining the chain and making sure that it was firm; 'but I don't mind telling you, as you ask. We are going to leave the ship and row ashore, taking a few little souvenirs with us. As an American myself, I know what an inquisitive race we are, and if we entered the harbour there 's no telling what silly questions we might not be asked. So we shall leave the schooner in the sole charge of Captain Endicott and yourself, and I do hope you will take good care of it. Miss Endicott, of course, goes with us.'

'What do you mean?' Hervey asked, fresh horror dawning in his soul, for Wilson's face was like a fiend's as he spoke.

'Well, we couldn't leave the lady, could we?' he asked. 'It would be too dangerous. Suppose, for example, the schooner happened to take fire after we left her. Oh, we must not expose the lady to such risks, and on shore I have Chinese friends who will be glad to give us—and her—shelter in places even my inquisitive and restless countrymen have never heard of.'

'You villain!' Hervey muttered, and made a quick movement towards him, forgetting his fettered condition, and conscious only that if he could but lay hands upon this sneering fiend he would kill him where he stood.

But the fetters on his wrists and on his leg restrained him, and Wilson laughed and walked away.

This, then, was their intention. Lucy they meant to take ashore, where she would be entirely in their power, and where they would be able to keep her concealed as long as they wished, or as was necessary, in such haunts as always exist in towns like Manilla, in spite of all the efforts of the authorities to stamp them out. For himself, helpless and fettered, and for the equally helpless man below, the plan evidently was to fire the schooner and leave them to their fate, in the certainty that the fetters of the one and the injuries of the other would make escape impossible.

Like a man dazed and numbed Hervey sat very still, overwhelmed by the horror of the thing. The night drew near. Wilson and his companions ate and drank and were very gay, evidently quite confident of success. After their meal they all lay down for a rest before they started, leaving only Drew on guard, who, however, soon closed his eyes and slept as soundly as the rest.

What was there to fear, indeed, from a girl and a wounded man and a man securely fettered? No wonder Drew slept soundly, while, in utter misery and despair, Hervey crouched in his chains on the deck and waited the awful end.

(*Continued on page 345.*)

FOES OF THE COCO-NUT PLANTER.

FEW trees are more useful than the coco-nut palm, on which so many millions of the coast and island populations of the tropics depend for most of the things they require, and millions in Europe also for food and other stuffs. Every year the wastage in the coco-nut crop is enormous; for not only do tornadoes work havoc among the groves and the plantations, but planters and natives have to fight many foes that feed on the coco-palm.

Monkeys and wild elephants do great harm. With almost human intelligence the monkeys place sentinels to give the alarm of danger, and form long queues to hand along the fruit or nuts, which are very soon got away; and the elephants are so fond of the young, tender leaves that often it is necessary to guard the palms by lighting fires and firing guns during the night. It is then, in the darkness, that in India the natives watch for the wild hogs and the porcupines seeking to eat the succulent roots of the invaluable palms. These do great injury to the trees—like the coco-bear or Malay bear, which is ravenous of the tender leaves. This interesting little animal seldom attacks the natives of the Malay Peninsula. Indeed, they aver that the coco-bear, instead of attacking strayed travellers in the jungle, may find them food without doing them the slightest harm.

One queer enemy of this most useful tree is the so-called marten of the palm-trees — a strange animal that climbs the coco, and drinks the liquid in the nuts. The marten is about nineteen inches long, and is as thick in the body as the average cat. In Java and in southern Asia it is very numerous, and it is one of the most fearless and ferocious fighters. Its head and its teeth are like a wild cat's; on the upper lip and under the eyes are long moustaches. At first sight it seems black, but on close examination is found to be yellow, the fur consisting of woolly and silken hairs. It is dappled with black spots on each side of its spine; these spots merge into black bands round the lower part of its lithe body. The first half of the long bushy tail is the same colour as the body, and the second half a jet-black. The black ears are tipped at the outside edge with a white border.

Every season this very odd-looking animal spoils countless coco-nuts. In Java the natives declare it does this out of sheer hatred to human beings, whom the marten of the palm-tree will turn upon with even less hesitation than does the most savage weasel.

Frequently the palm-squirrel is to be seen frisking on the trees on the East Indian shores. When it can, this squirrel makes use of the holes gnawed in the green nuts by the marten, to drink what is left of the water. Yet it also can tap the nuts, and sip its fill of their delicious fluid.

Rats are great coco-nut eaters, and do immense havoc, especially in Mauritius, Reunion, Keeling Islands, Diego Garcia, the Caicos Group, and in Fiji and other Pacific islands. They eat holes near the stalk, always choosing where the hole will not let out the water, then get inside and drink the water; the coco-almond they eat at their leisure. Green and ripe nuts come all the same to them.

Many are the enemies of the coco-palm and its nut; and among the worst are birds. Beautiful and interesting it is to see the parrots climbing and chattering, all gorgeous in their plumage, and sucking the pollen of the splendid golden flowers that rise above the green leaves of the coco-palms; yet they and the macaws destroy the fertility of many coco-nut trees, though they are not so destructive as a kind of sea-swallow — the black noddy. It builds its nest among the stalks of the leaves, and when stormy weather prevents it from flying out to sea, it passes its time pecking the flowers of the palm. In this way it causes at times a very poor yield of nuts on certain of the Indian islands.

Insects, also, prey on the coco-palm. The termites, or white ants, build their nests on the tops of the trees, and kill them from their crowns; the species that find a home at their base poison the roots. Among many others, the rhinoceros beetle, which is very like a miniature model of the unicorn rhinoceros, cuts his way into the leaves, and eats the topmost sprout; while his wife bores holes in the trunk, to lay her eggs in them, and kill the tree.

The queerest and most interesting of all the coco's foes is the climbing or sepoy crab; and round it there are many stories told, especially in Mauritius. Half lobster and half crab, it is of a formidable size for a crustacean, generally measuring twenty inches or so from the point of the claw to the end of the abdomen. Occasionally the sepoy reaches more than three feet in length, and the natives speak with awe of such monsters—one of which is said to have stolen a child!

It lives in a water-logged hole among the roots of trees, is particularly addicted to making the coco-palm both its home and its hunting-ground, and will travel some distance to steal the fruit of it. When the sepoy has climbed the trunk of the palm, it detaches the nut by tearing the fibres of the stalk till the nut falls. Then it comes down, finds the fruit, and drags it off to its hole. Here, patiently and laboriously, the crab strips the fibre, bit by bit, until the almond is completely bared. It is too provident a creature to wait until one nut is done before it gets another. Like the squirrel, the sepoy keeps a larder; and annually its species is accountable for an enormous waste of good food-stuff.

However, this remarkable thief of coco-nuts —which in itself is a pretty sight, with its colour of sky-blue shading into white, with white patches speckling the blue of the carapace and of the plates of the abdomen, the blue sometimes passing into red, and the white into yellow—is remarkably good eating too. So it pays the penalty. The natives put their arms into the sepoys' holes, and, seizing their claws in a bunch, whip them out suddenly and skilfully. One pinch of the powerful great left claw can do much injury. When cooked like a lobster, the sepoy is something worth eating. The coco-nut grower then does get a little of his own back!

ROSES AND DREAMS.

O TIME of roses and of dreams,
So fleeting and so fair,
Elusive as a mirage hung
Upon the ambient air!

The wonder in a maiden's eyes,
The bloom of lips unkissed,
The first note of a bird at dawn
Are winsome things, I wist.

The spirit of all loveliness
Are thine in very truth;
O time of roses and of dreams,
Thy other name is—'Youth'!

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THE pleasures of shopping are now enhanced; they could never have been so exhilarating as in London, capital of all shopping, during the new spring season. To make the saunter of an hour along a part of Piccadilly, up the length of Bond Street, then through a piece of Oxford Street and down by the bend of Regent Street to the place where such walk began is to be given the opportunity of some education in production and in progress, and the stuff for many deep speculations, starting upon a theme of nature and ending with economics. A man (or, better far, a woman) with a few pounds in a purse and an open mind upon all matters of purchases—the crushing period of unsatisfiable needs, we may suppose, is past—should not emerge from such an experience without some personal gain. In recent years the normal adventure of shopping was vulgarly increased through the twin difficulties of shortage and profiteering, so that the husbandman, and also the husbandwoman, fared forth to the shops in the way of savages entering the forests in search of that which they needed for their sustenance. They encountered there such enemies as they thought early Britons might have met in times when our islands were somewhat raw. Salesmen showed independence, nearly a hostility; they defended their possessions against these household raiders. They seemed unwilling to part with them—or affected such a disposition; they spoke of scarcities, of sacrifices made; often they came near to incivility, and, according to the custom of the period, they lied outrageously, in particular upon the quality of their goods. Shoppers at such times, the primitive instincts forcing them, hardened their hearts, casting aside such gentleness of manner and conduct as had been trained and encouraged from their youth. From such an adventure a gentleman, a professional man, one of good family and not without a balance at a bank, might emerge triumphant with a chicken and a bag of real potatoes, carrying them home himself with the pride of the successful hunter and a gourmet's anticipation. Yet such adventures did not cultivate the best of the shopping instincts in us, the finer art of considered and perfect purchase. Were we not coarsened by them? Was some faith not lost? There were moments when one might even have suspected the conduct and the statements of some of the great, the venerable, shopkeepers of London, such was the strain, the struggle for existence. It is sometimes unfairly and inaccurately said that even the normal charges of these super-shopkeepers, holders of businesses that have come down through generations, are so excessive that only stupids of Mayfair could ever deal with them. That is nonsense. These aristocrats among purveyors have a sense for themselves that some others may not understand. Quality and taste are certain; there are guarantees and conveniences, a lofty mutual confidence between patron and tradesman, and a sense of the dignity of procedure. A peculiar satisfaction is given to shopping in these rare conditions; we may depend upon our man. His taste is nice, his resource extensive, and we take his word like that of an archbishop. He is a part of the system of our existence, as perhaps his grandfather was part of our family affair of two generations gone. Nowhere as in London are there such aristocrats of the counter. It is the manner and the mellowness, the age and the richness, of London that have brought forth such gentle, careful providers of our needs. One thinks of a bookshop in Piccadilly, of a tobacconist more in the east, of shoemakers and some dealers in pretty things. When I ask my bookseller for a copy, difficult for some reason to obtain, he needs not my instruction to ransack everywhere in search of it, and it matters nothing, in his thoroughness and enthusiasm, whether it is an affair of sixpence or six guineas. I like doing my little business with such people; it seems worth an extra point in my expenditure. It is a satisfaction to be gathered completely in London as not elsewhere, and not by all in London.

* * *

But yet the happiness of shopping is not limited in admission to such rare marts—lions and unicorns above their doors and windows—where one may brush against a foreign king and queen inspecting at a counter. Wide changes have swept over London shopping since old Victorian days when stores, started by some naval and military persons who were busy out in

 [*All Rights Reserved.*]

India, formed a kind of feature of the London system. The vogue of stores has much advanced since then. One day long back I was in Chicago, where, as none would be surprised to know, they have the finest example of stores on earth. It is, indeed, such an excellent store, such a great achievement—one says it in sincerity—such a profitable and successful adventure, that a daughter of the founder is now the wife of a peer of this our realm, and no peer of simple heredity, but one strong man who, as much as any, held our island safe in time of war. In these polished and handsome, most elegant stores in Chicago I realised that America had made another discovery, and that we should need to follow quickly such example of convenience and efficiency. London has done so, and is without match in our country. The freedom, the civility and the thoroughness, the business efficiency and the fairness, the convenience and the selection of such stores are appealing features. One hears that the profits of such a house, just one of them in London, last year were three hundred and seventy-five thousand pounds—more than a third of a million pounds in profits, one shop in London in one year. It is an instruction through pleasure to walk in contemplation through some of the larger and finer stores. One gathers a sense of the world and of work, to be acquired neither from books nor many travels. Here is the merchandise of the world, the pathetic effort of all humankind in artful and clever labour. Here one appreciates a fight between the nations, a greater and a finer fight than such as are fought with guns. There are pointers for many philosophies. We perceive economics in being, ambition in action (making a note of a demonstration by Japan), and acquire a special impression of an empire. Here are the work of the world and the fruits thereof in infinite variety; to meander through it, and think a stage or two beyond the present offering and the price, is newly to apprehend some aspects of the strange romance of human force and efforts.

* * *

There are two chief shopping streets in the world, where a purchaser of taste experiences a sense of exhilaration and inspiration. They are the Bond Street of London and the Rue de la Paix of Paris. One is not satisfied that we do not continually include the Rue de la Paix in this joint supremacy as a matter of custom and a compliment more than otherwise, for by nature and gallantry one takes occasion to extend praises to lovely Paris. The womenkind, for their own special purposes, not being those of simple shopping, have much business in this part, vastly expensive too, and this serves for the assistance of the reputation. A common bilingual pun is that here you pay first and rue afterwards. Upon other counts I do not think the Rue de la Paix would come near to the top of the class, for immediately in attendance upon our Bond Street, as the next best and most attractive of the world's shopping streets, are surely her three neighbourly relations, Piccadilly, Regent Street, and Oxford Street. The Rue de la Paix has not the extent, or the variety, or the mellowness of a first-class shopping-place like Bond Street. It is good indeed; it is so elegant, so neat and nice, the shop windows all framed up close and flatly, and tastefully too, in black and gilt and marble. The Rue de la Paix is like a *grande dame* of shopping streets, but sometimes it is suspected of pretentiousness. It has not the stately strength of Bond Street, which, begun at the end of Stuart days, has pursued an even evolution. It is a little curious that the history of the two, following different courses, opened within a couple of years of each other—ours in 1686, the French two seasons later. But there was not then in name any Rue de la Paix, or for long afterwards; there was no such peace as the French desired to celebrate by names of streets. The beginning of this part in Paris was not with a street at all, but with a Capuchin monastery that Louis Quatorze constructed, with most extensive dependencies, the circumstance being commemorated, as we know, by the Boulevard des Capucines, running by one end of the present street. Such as strain for comparisons and coincidences—which, of course, are to be found in nearly every fact, if sought—may be entertained by the circumstance that Sir Thomas Bond, who gave the start and the name to Bond Street, was by religion a Roman Catholic, and Comptroller of the Household to the Queen-Mother, Henrietta Maria. He was no splendid person, but was rich, and that was much; and it was much to Charles the Second, to whom in exile was advanced some money by Sir Thomas, who had aforetime received his baronetcy from that monarch. In those days Bond was called the first of the company promoters. He lived at Peckham, where he enjoyed a celebrated house and garden. However, Thomas Bond had faint colour in character and personality, and seeing the brilliance, the cleverness, and the beauty that have walked and talked down Bond Street these last two hundred years, one begrudges him the fame that with his bourgeois spirit and his money-bags his name, but his name alone, so securely earned. While Bond Street progressed and developed, the monastery in Paris came to an end a hundred years or so after the time of its foundation. It was suppressed; the place was nationalised; paper-money began to be made in some of the buildings there—an omen, maybe, for the Rue de la Paix; and there were also gardens for the people. Then came Napoleon, and it was he who conceived this street, still bearing something of the Napoleonic mark in its appearance. He ordered that a good, straight street should here be made, and

he encouraged it towards a certain perfection in thoroughfares. It was a pet of his in streets, partly, perhaps, because when the workmen excavated they found many relics of Julius Cæsar, Trajan, and other great and noble Romans, in whose footsteps as a conqueror the Corsican had trodden. Napoleon, to stimulate the choicest building in this his street—name of the Rue Napoléon it had—determined that all new constructions there should be free from taxes for fifteen years, and he gave advantages in payment for the land. So the street progressed; but long afterwards Parisians came to regard it with something of disdain, and never more than when it became a quarter which the richer English inhabited upon their visits, the hotels endeavouring specially to please these foreign folk with money. In 1875 the name of Napoleon vanished, and it became the Rue de la Paix, elegant always, perfect in taste, truly a pleasant street to pace along, but still for shopping nothing to our pride of London.

* * *

Fashionable now, Bond Street began by being so. It is a rare example of a street or a place consistent through its time of changing views and conflicting prejudice. Hardly a part of London but is a ghost of a former glory. But to the fashionableness of this splendid street, mellow and rich, an unbroken line of aristocratic sentiment and appearance belongs. The 'nobility and gentry' immediately favoured it for living in; it was scarce thirty years of age before Bond Street lounging had become a social system, which has hardly ever ceased since then, being to-day an established popular pastime for people of taste and culture—let us say that—for no man or woman of dull mind would care much to walk down Bond Street twice or thrice. It is a place for an alertness, for discernment, for appreciation at every step and turn of the beauties of production, and how they may be acquired by labour with much good fortune and fine influences favouring. In a stroll down Bond Street a young person might sometime think at pauses of the Empire and of silver spoons, two things surely most indicated to philosophers in these parts. Nobility and gentry truly, and in numbers, and famous parties have there been by night in Bond Street in times gone by. The elder Pitt lived here; so did the first Duke of St Albans, reminding us of King Charles the Second and 'poor Nellie.' In a London without grand opera, that old-time work *The Beggar's Opera* has lately achieved a remarkable success, and nice people from the middle and all parts of London have stolen away to Hammersmith by 'Tube' to listen to that tunefulness, and a song among many that told of one who felt 'how happy could I be with either, were t'other dear charmer away.' Now this brings us in special remembrance to Bond Street again, for here lived Lavinia Fenton, she who was the Polly Peachum upon the first production of *The Beggar's Opera* in Lincoln's Inn Fields. And that was within seven years of two hundred years ago! Nothing else but Shakespeare—and little enough of that—which is two hundred years old or more has succeeded so well in London in these times. Lavinia at the beginning of this period was twenty; her salary was fifteen shillings the week. It was *The Beggar's Opera* that enabled her to come to live in Bond Street—which was not done for fifteen shillings a week. She became the town's talk; while John Gay and Rich, the producer—these names come in rather curiously—made enormous sums of money from the show. And it led at last to Lavinia being Duchess of Bolton, if you please. A pleasant woman it is said she was, keen in conversation too, but not a beauty.

* * *

In the old days the street of shops and strollers, used more for residence then than now, had inevitably associations with great people of the art and literary world, straggling as they do to all populated places, distilling trifling essences of their fame in many chambers and thoroughfares. Edward Gibbon abode here a while, and read his books in solitariness, as he has said, while he heard the coaches rattling in the streets outside. This is to be explained. Many people hear of Gibbon with something of self-reproach, for than his *Decline and Fall* there are few works more worthily praised and famous that are at the same time less read by such as would profit well by their many pages. The hypocritical may protest, but this is true. How many who stroll down Bond Street, purring in contented philosophy on empires and their satisfaction, have read the story, with its impressive morals, that Edward Gibbon wrote of Rome? He had not written it when he rented rooms in Bond Street; the matter upon which he meditated at that time would be more agreeable than Rome for a talk to people who walk down Bond Street now. Edward Gibbon was at that time young; he was young, and he was much in love. He had just returned from Switzerland, where he had fallen slave to the charms of Suzanne Curchod, a Protestant pastor's daughter, had told her of his love, had offered to marry her, and was accepted. But, returning to England, he found his father would have nought to do with such a business, and sighing, as he tells us, the future author obeyed. A year later he began his first book, but more than ten years passed ere he wrote that impressive story of the Roman Empire. In the meantime Suzanne, jilted, accomplished a fair consolation. She married a celebrated Swiss banker, Necker, who became Minister to Louis Seize and was the financier of France during a period of severe strain and difficulty. She became the mother of Madame de Staël; so literature was here again.

Thus we understand why Edward Gibbon at twenty-three passed nights solemnly among his books in his Bond Street lodgings while the coaches clattered by. James Thomson, 'poet of the Seasons,' lived in Bond Street once, and Laurence Sterne died in it. Sir Thomas Lawrence was another who dwelt herein. It becomes a little more difficult to visualise the great Nelson living in this street, and often when I see mezzotints after Romney of Lady Hamilton as Diana or some one else in the windows of the art-dealers here, a common occurrence—really I hardly seem to remember Bond Street without such a picture shown—I wonder if all know of this conjunction of persons, place, and circumstance. Nelson came to live here for a time to get mended and recuperate in 1797, just after he had lost his right arm, but Lady Nelson, at his own special request, was attending him and dressing the arm for him. Being in constant pain, he was given a little laudanum one night to help him on to sleep, and that very night the news of Duncan's victory off Camperdown reached London, and the town was lighted up. The admiral was but a lodger in the house, and the occupying family made no display outside it. Observing this, the mob, much punctilious, as is the way with mobs, came with a rattling and a banging at the door to know the reason why. There was no other than simple inadvertence, but the demonstrators were informed that Nelson was lying ill upstairs, whereupon they quite graciously consented that, lights or not, the place should not be disturbed again that night. So Bond Street was left fit for heroes.

* * *

Bond Street is not gay at night in these times. Like the city, it does its business in the day; at night it passes early to tranquillity. But once it had joyous evenings; there was one which is famous among the nights of old London. Boswell had a lodging there, and rising to a great ambition, had a feast prepared one night for his distinguished friends. There came to it Johnson, of course, and David Garrick, Oliver Goldsmith, Sir Joshua Reynolds, and some minor lights. Boswell, we may be sure, did not fail to tell us all about it. There was Garrick playing round Johnson with a fine vivacity. 'Taking hold of the breasts of his coat, and looking up in his face with a lively archness,' the actor 'complimented him on the good health which he then seemed to enjoy; while the sage, shaking his head, beheld him with a gentle complacency.' One of the party was late, and Boswell was for beginning the feast without him, asking, 'Ought six people to be kept waiting for one?' Inevitably Johnson could add something subtler to such common wisdom, observing, 'Why, yes, if the one will suffer more by your sitting down than the six will do by waiting.' Goldsmith was wearing some new clothes, and, being inordinately vain of his attire, was strutting about and chattering of the plum-coloured breeches and the rest of it that he had just acquired. The suit—to call it a suit—complete cost him a total of sixteen pounds and one shilling, which, much as it seemed then, was less than he would have to pay in this neighbourhood to-day. Garrick set out to make a little fun of him, so Goldsmith turned round tartly to say, 'Well, let me tell you, when my tailor brought home my bloom-coloured coat, he said, "Sir, I have a favour to beg of you. When anybody asks you who made your clothes, be pleased to mention John Filby, at the Harrow, in Water Lane."' Johnson, the spoil-pride always, came in again then with, 'Why, sir, that was because he knew the strange colour would attract crowds to gaze at it, and thus they might hear of him, and see how well he could make a coat even of so absurd a colour.' That night there was rare conversation; Boswell has left a record of some parts of it. Always rather proud of his dinners, he never had better company or an easier flow of wit than this. Of the last two thousand nights in London we might pick a hundred—yea, two hundred—that we would have yielded up to blankness to have lived that one with Boswell and his sparkling company.

* * *

Yet naturally there is not a thought upon these matters when people saunter down Bond Street now. Not a thoroughfare in London is less blessed or troubled by its ghosts. There are places in the town where, though you catch not the meanings, history seems to be murmuring from every stone, but Bond Street now is the street of moderns and all the glory of their own. Here you may see much of the finer world at times, and nearly everything in the way of appropriate display that it is good to see. Upon a fair morning you may witness women dressed for their walks in town as handsomely as anywhere in the world. One does not recall, in a thousand strolls from end to end, ever having seen a really shabbily attired person, while not holding that a few such may not have escaped the glance. But the shabby have no business here; peeping in from Piccadilly, or glancing down from Oxford Street, they realise that this is no Paradise for them. Once only have I seen a beggar in this street. It was not long ago. A man with masked face was operating a barrel-organ bearing an inscription that he, as an officer, was wounded in the war, and had to resort to such a humiliating means of earning his living now. (But it has been proved that cases such as this were frauds.) Bond Street is an exquisite harmony in its shops. It begins colourfully with some utility in provisions, in tobacco, and silks and things. Once or twice in the full stretch of the street the provisions intrude again, like the rattling of a drum making sweeter still the soft enchantments when their succession comes. As we ascend to the

crest of the part of the street called 'Old' and enter upon the bend, falling and then rising again—a charm of our London streets, much different from the ruled straightness of the great streets of other lands—the finer notes and phrases are struck. There is, as we may say, the Jewel *motif*, deliciously brilliant and sparkling, and there is the Art *motif*, each repeated many times in windows farther on. The themes of gowns and luxury are predominant; in the middle of the piece music, as apart, is heard. The finale seems to me a little cynical; does it not mock at our worldliness, however well adorned? For, as again we ascend a gentle slope towards Oxford Street, the somewhat less delicate influence of that great and thronged thoroughfare, so prosperous, seems to pour in upon us. We end with dog-shops and sewing-machines—good and commendable things they are, but not of Bond Street, truly.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER V.—*continued.*

VI.

WHEN they had found out all that was possible concerning the movements of Heloise Reys and her companion, the detective, Xavier Gatineau, performed those mystical and satisfactory wonders that only railwaymen know how to perform.

First he had a protracted conversation with North Bay over the long-distance telephone. He disappeared into the traffic superintendent's office. Then he came out and advised another meal, and a good one, and also the gathering of bags. In an hour's time they were down at the depot again, and were on the light, skeleton motor-trolley railwaymen use to get from place to place. It was a hard, jolting, none too comfortable thing, but it had pace, and it was, as Gatineau said, their only means of reaching North Bay 'in hours.' For trains were rare on this line.

As they rocked and swung at a good pace through the strange, primitive country, where the harsh, grim rock thrust its way out of the thin soil, and among the trees until they looked like a thin upstanding of hair on a bald head; as they passed the stark and blanched ruins of burnt forests looking as though they were woods smitten by the shell-fire of the war-zone, and saw occasionally the expanding lakes amid the barbaric surroundings, Clement and the little detective alternately talked and dozed.

They needed sleep after their wearing night, but on this jerking car it was not easy, and though they clung to the low centre iron hand-rail, which was the only support, it was often only a touch from the alert motor-man which saved them from nodding themselves off into the ballast beside the railway line.

Talking was not easy either, because the rattle and jolt of the little frame-car and the noise of the motor made conversation pitched below a shout inaudible. But they talked enough to form conclusions as to what was taking place in the plot against Heloise Reys and her million of money, and what steps they must take to counteract this as far as lay in their power.

Concerning the girl, they were both satisfied that, as a stranger in a land where the companion Méduse Smythe was at home, Heloise had left the whole business of travelling and of routes in that designing woman's hands. When they found at Cobalt that Henry Gunning had left, Méduse Smythe would probably see to all the arrangements for following him. She could take the girl after him along any route—they, of course, felt certain that both knew the place for which Gunning, under the wing of Neuburg, was bound—Neuburg would see to that. Well, knowing that place, Méduse could manage that they went to it by devious ways, and with frequent changes. The women were travelling light, with no conspicuous baggage to attract attention and leave clues behind.

'She can even,' said Clement, referring to Méduse, 'carry off Miss Reys to some outlandish place on the pretext that Gunning has gone there, to find, when they arrive, that Gunning has once more left, and they must follow him somewhere else. All the circumstances are in their favour. Wandering about like that is the sort of thing Gunning might do, has a perfect right to do, since he is not supposed to be expecting Miss Reys. Wandering about is the best possible way of side-tracking us, and covering up their own movements.'

'Yes, it 'll be very easy to lose them, but not so easy as they think. I 've already set things rolling. Our man at North Bay is making inquiries. He is also getting through to The Chief at Montreal; there 'll be a general warning sent out all along our lines. If there is any clue to be had in that way, we ought to get it. But it is rather like trying to work a way through a maze—there are a thousand ways for us to go astray, for them to give us the slip.'

When they arrived at North Bay station, they clambered stiffly from the motor-trolley, satisfied the motor-man's natural desires, and walked along to the railway offices, slowly getting action into their cramped limbs. Clement, who had suddenly become curiously quiet, checked outside the station-master's door. 'You have all the descriptions, and you 'll ask all the questions, I know,' he said quietly.

Xavier Gatineau was far too well trained to show surprise, yet he undoubtedly felt it. 'You 're not coming in, then? Don't you think'——

'No. There is something I want to do. I 'll take these suit-cases along to the baggage-room, and ask some questions there.'

'There?' began the detective, as if to emphasise the absurdness of going to the baggage-room. And then something in Clement's manner forced him to shut up. He merely said, 'Very well, I 'll meet you here in half-an-hour, say,' and turned in at the door.

In half-an-hour he met Clement on the platform. Clement's eyes said 'Well?' though his lips said nothing. The detective answered that look. 'The ladies stopped off here, and changed. They have gone south. They reserved a section as far as Orilla.'

Although he had a right to be startled, for Orilla was a small junction-town in a direction leading right away from the west, where Gunning might be going on his way back to Sicamous, or from the east, if a return was being made to Montreal; although the information was surprising enough, Clement said 'Orilla?' in a voice so loud that the detective was himself taken aback by it. Before he could say anything more, Clement, still talking loudly and excitedly, went on: 'Orilla—Orilla, of all places. But it fits in, doesn't it, with what I have told you about the cunning of these rogues? They 've got Gunning to that out-of-the-way place to throw us completely off the track. That 's their strategy through and through. They have counted on our rushing off straight to Sicamous. Sicamous is the likely spot. And while we are chasing away there after nothing, they 'll bring off the meeting between Heloise Reys and Gunning in Orilla. It 's like them. It 's on a par with the rest of their devilish ingenuity. But they counted without our cunning. They counted without your company's organisation. They 've forgotten that. And that 's where we score.'

'I found out'—— began Gatineau, quite mystified by Clement's tone and manner; but Clement cut him short.

'You found out when the next train goes to Orilla. When 's that?'

Certain that there was something behind it all, Gatineau began to play up. He named the time of the train.

Clement swore heartily. 'Hours to wait. But, my dear man, there must be a quicker way.'

'I 've been trying to find one,' said Gatineau, now convinced of the part he had to play. 'There is no quicker way.'

'What about one of those little motor things we came in from Cobalt on?'

Gatineau answered the gleam in Clement's eye rather than the spoken question. 'I asked for one. It can't be done. I even insisted. It 's not their fault; they simply have nothing for us. It 's that train or nothing.'

'Hours to wait,' cried Clement again. 'I say, this sort of thing is simply unbearable, isn't it? Hours—and in those hours who knows what might not happen?' Under the stress of his impatience he caught the detective's arm and swung him along the platform. They tramped to the far end, Clement still protesting vehemently, and then, astonishingly, as they swung on their tracks, and in the same kind of voice, he said, 'You can talk and behave rationally, though I can't. Tell me anything else you 've found out—quick.'

'I 've found out that men answering to the description of Neuburg and Gunning pulled out of here for the west. They reserved for Winnipeg.'

'And I,' said Clement, still simulating excitement—'and I have found out that we, or rather I, am being shadowed. That large man there standing by the telegraph-office is the fellow. I noticed his studious inattention the moment we got off that motor-trolley, and he has been studiously inattentive ever since—and always near my elbow. We 'll play innocently for his benefit.' He went on at once in his accent of protest as they neared the man: 'So there 's nothing for it, then. Hours to wait. Well, I 'm going to fill the time with a bath and with a sleep. Shall we get reservations on that train now, or later?'

'Now,' said the detective. 'That 'll save a scurry at the last minute.'

Together, still talking about Orilla and Heloise and the gang, they went to the booking-hall, and Clement reserved a section for Orilla. He asked one or two questions about the journey: whether people ever stopped off at towns on the way there, and whether there was any time for people to make inquiries at such towns; in fact, he advertised his immense concern with regard to Orilla to anybody willing to listen. And the large man, still studiously inattentive, listened.

The reservations made, Clement and the detective walked out of the station towards the near-by hotel. Passing a plate-glass window, Clement said, 'He is following us, our inattentive friend. He 'll shadow us as far as the hotel, see that we are safely in our rooms, and then he 'll run off to send some sort of message to brother Neuburg at Winnipeg or somewhere west.' His tone had a hint of question in it.

Gatineau smiled. 'Yes, I fell to it that that was your plan, Mr Seadon. Leave that to me. I 'll fix it. I know this hotel, and this town. We 'll reserve rooms; but let me go along to mine first. See here; we 'll both start out together after getting our keys, an' you 'll be attracted by the news-stand or the magazine-counter. You 'll break away from me to it, callin', say, "I 'll see you in this lobby, then, in a couple of hours' time." Spend as long as you like at the magazine-counter—make it five minutes at least. Then go to your room.

I guess you're the man he means to keep his eyes on, an' as soon as he sees you behind your door he'll feel he's safe. He'll leave the hotel—an' I'll be waiting for him. Shadowing is a game I can give him points at, anyhow.'

Gatineau was good at his work. A short time after he had parted from the Englishman, he was back and tapping at Clement's door. Clement, shrouded in bath-towels—for there is no object in having a bath handy if you can't employ it—let him in. Gatineau, all smiles, sat down, fanning his bald young head with his felt hat.

'It was like falling off a wall,' he grinned. 'He came straight out of the hotel, and went direct to the rail-depot we've just left. He didn't even look round once. An' he went as straight into the telegraph-office. He filled a blank and handed it in. I had already dodged round into the office entrance, and when he had left the place I slid up to the operator and told him to hold the wire. I went out again, and trailed my man until I saw him take up a tactical position in command of this hotel doorway. Then I went back to the telegraph-office.'

'And you saw the wire? Good man!'

'Here's the wire.' Gatineau handed across a filled-in form. He saw Clement's surprise. 'Being on the police side, I have a pull,' he explained.

Clement nodded, and read the wire. The slip contained the following words:

Arthur Newman, Banff Springs Hotel.—Our party reached North Bay from Cobalt heard of Orilla go there evening train me too. Nimmo Bates.

'Nimmo Bates!' said Clement. 'I made certain it was Joe Wandersun. I've never met this Joe—unless I did in the dark at Quebec—but I felt it must be he, and not a new man.'

'It probably is Joe,' said Gatineau. 'He'd likely use this instead of his own name, as that is known. Especially as Arthur Newman is a new name for Adolf Neuburg.'

'That's quite likely. But he's sent the wire over your line. That's rather a bad slip.'

'He can't help himself; the C.P.R. line is the only way of getting a wire to the Banff Springs Hotel. He, no doubt, felt safe enough now that we had asked all our questions, and had decided to go to Orilla; and he had changed names on the telegram.'

'That is sound,' admitted Clement. 'And it bears out our information relating to the movements of Neuburg, who is going west. Banff is a good base for Sicamous, too—an excellent and easy point for Méduse to make for when she has baffled us enough. She and Heloise Reys could naturally stay in Banff until Gunning was ready for them and the whole matter safely arranged. Yes, Banff seems to me to fit in with the facts. It must be Banff, and we're justified in going there. And, hang it all! it's the very place for a love-affair. The mountains, the quiet, the beauty. Oh, a most fitting place.' He thought steadily for a minute or two. 'Yes, we go to Banff. Meanwhile there is this fellow Nimmo—or Joe'——

'I'll deal with Nimmo or Joe,' said Gatineau grimly.

'There's this telegram. Adolf or Arthur, having heard from Nimmo or Joe, will expect reports from him concerning our doings at Orilla or thereabouts.'

'Oh, that isn't the telegram that was sent.'

'Eh?' gasped Clement.

'I sent this one,' smiled Gatineau, holding out the carbon copy of a telegram. Clement took it and read:

Arthur Newman, Banff Springs Hotel.—Our party reached North Bay from Cobalt lost trail return evening train Montreal me too. Nimmo Bates.

In answer to the look of perplexity on Clement's face the little detective explained: 'I know there is a risk, but I felt I had to take it. You see, there may not be any more of the gang in Montreal. Well, Neuburg certainly expected some sort of report, and I had to send one. The original one would keep him on the alert; my substitute will lull him. I think it will strike him as natural that, having lost the trail, we should go back to Montreal and our police headquarters there—for he sure knows that we of the C.P.R. are in this business. Well, figuring that he will accept Nimmo or Joe's going to Montreal, and will feel safer about it, I wired that. I am also sending a train-letter to The Chief, reporting up to date, explaining the steps I have taken here, and enclosing the copy of both these wires. The Chief will know how to send to Arthur Newman in Banff from Nimmo Bates in Montreal reports that will further lull Arthur. Meanwhile we go straight to Banff.'

Clement laughed uproariously.

'Well, of all the calm, far-seeing, and clever little devils I have ever met, I think you take the prize. It is a complete and dazzling scheme. It is a perfect scheme—that is, with Nimmo or Joe out of the way.'

'Nimmo or Joe will be out of the way,' grinned Gatineau.

'And how?'

'When you've had your sleep I'll show you how. And now—I'm going to have mine.'

'All right; I'll wait patiently, for I'm certain it will be worth it.'

And it was.

Roused by the little detective, Clement walked with him to the railway-depot. Advised by the little detective, he walked on to the platform, turned into the booking-hall, and then, after a moment's hesitation, walked through it as though making for the street entrance.

As he did this Gatineau left his side and went to look at a time-table. Nimmo or Joe, who had shadowed both from the hotel, did not hesitate as Clement had done. Clement had his

chief attention; he followed Clement without a falter.

That is, he did until, feeling a hand on his shoulder, he swung round, to see the muzzle of an automatic pistol pointed at his nose. He also heard the voice of Gatineau say, 'Nimmo Bates, I want you for the jewel robbery on the *Empress of Prague*. I advise you to cut out the rough-house stuff and take it quietly.'

For a moment Nimmo Bates, or Joe Wandersun, as later it proved to be, hung hesitant, mesmerised by that muzzle near his nose, and as he hesitated three large railway-policemen holding pistols slipped out of the booking-office. He glanced once at them—and then put up his hands.

'Take him along, boys,' said Gatineau. 'The Chief will see you have your instructions at Montreal.'

As the railway-police hustled the half-dazed rogue out of the place Gatineau went to the booking-window and said, 'Say, Jim, got that reservation for a drawing-room on the next west-bound—the one to Banff I spoke you of this afternoon? Good! Is she on time?'

(*Continued on page 360.*)

HINTS ON DRY-FLY FISHING.

By G. L. Ashley Dodd.

THERE are many excellent books on the whole of this art, and it is not the intention of the writer of this article to touch on the points treated of therein; his purpose is merely to offer a few hints and tips to the beginner which he would otherwise have to find out for himself.

I will first deal with the actual casting. Most beginners at dry-fly fishing have already had a certain amount of experience in wet-fly fishing on lochs or mountain streams, and are apt to think that, because they can cast a straight and accurate line, they have little more to learn. This is not the case. Accuracy is certainly imperative, but a straight line from rod-point to fly, however well placed, will often put down a rising trout in the clear chalk-streams wherein they have received a thorough education. Moreover, there is usually less necessity for the fly to drop lightly on the water in wet-fly fishing than in dry-fly fishing, where lightness is the essence of a correct delivery of the fly.

In casting over a rising trout, the first thing to consider is the position of the sun with regard to the trout, because the flash or the shadow of the gut passing over him is quite enough, as a start, to give him warning that all is not well. (I am now taking it for granted that the angler is in the usual position of being more or less behind the trout. When he is fishing a broad river, such as certain stretches of the Itchen or the Test, he is often able to stand directly—or practically—opposite the trout; in such cases these remarks will hardly apply.) Therefore, if the sun is shining on the left of the trout, your cast should be directed to his right, and *vice versâ*.

The correct method to put the fly over him is to cast in such a way that the line and a part of the gut are quite straight, but that the end of the cast terminating in the fly should curl slightly, so that no gut passes over the fish while the fly will do so. This can be managed quite easily by always making a point of never casting the whole length of line from the rod-point, but by keeping a certain amount in hand, and shooting it through the rings at the time the rod is in the forward position after casting. A little practice will soon make any patient person an adept at this.

The curl given to the end of the cast is made by checking the line slightly, just before it reaches the water, by turning the wrist upwards and to the side desired. The check after shooting the line causes the fly to drop lightly, instead of hitting the water, and if (as it should be) it is just in front of the trout's nose, this gives the fly a most life-like effect as it lands.

In rough or 'curly' water, the closer you can drop the fly in front of the trout's nose the better, as the slightest drag is enough to put him down; but in a smooth, even stream I greatly prefer to drop the fly about six inches in front of him. Trout in rough water are usually quicker in their movements and more on the alert than those in calm water; the latter usually take a deliberate look at the fly before rising, and if it drops too near them will frequently not bother to turn *after* the fly, though they will often move *forward* slightly to take it.

It usually pays to cast a fairly long line when one is dry-fly fishing, because, in the first place, there is less danger of the trout catching the flash of the rod out of the tail of his eye; and, in the second place, with the ordinary heavy taper-line used, greater precision can be obtained with the greater weight, especially if there is any wind. Further, a long line will usually obviate any necessity for the angler to take up a cramped or a kneeling position, though many fishermen of the older school appear to think that one of the necessities of this type of fishing is invariably to crawl about.

Never wade if you can possibly help it; it disturbs the water as nothing else does, gives a free education to the trout for another day, and is most unfair to any other angler who may

shortly be following you. It may be necessary to wade to cross the river to get the fly out of a bush, or to put the fly to any particularly tempting trout; if so, do it, but get out of the water again as soon as possible. The height of selfishness is to get into a somewhat muddy chalk-stream and fish wading up it. Besides, this is a very short-sighted policy if the water is your own; if it is not, and you have been given a day on some one else's water, it is a crime against your host.

Your rod should be stiff, and in length anything from eight to ten feet, according to the water you usually fish and your own fancy, and the finest undrawn gut is to be recommended.

In striking, a turn of the wrist is sufficient to drive the tiny barb home; a strike from the rod, with fine gut and a big trout, will very easily result in a lost fly and a lost temper.

Don't get flurried or despairing if a trout weeds you in a place where you can't get at him; keep a firm hold on him, turning your rod down-stream, and he will nearly always kick himself clear.

If you see a trout cruising in dead water, such as a mill-hole when the water is shut off, watch him for a few minutes before you cast. You will then notice that he has a regular beat, returning at intervals to the same place. Note the interval, and the way he cruises, and then, just before the time is due for him to make his turn to that place, put the fly there, and let him come to meet it. Many a monster has fallen victim to that trick, when a cast over him would have put him down. Of course, if you can rest your line on a bit of floating weed or stick, so much the better.

Always treat the last three or four yards of your winch-line with deer or mutton fat, rubbed sparingly on to a bit of 'shammy-leather' and thence to the line; this will keep the line floating indefinitely, and prevent unnecessary drag on the fly. Do this at least several times a day. Some people do it after catching each trout.

Always make a point of studying the various flies on the water. Don't take it for granted that because you've noticed a good hatch of (say) pale olive duns the trout are necessarily rising to them. They may really be ignoring the olives and only taking (say) a watery dun; by the time you have at last arrived at that fact, the rise may be over and your basket empty. Another day it may be the olives' turn, the watery duns being ignored. I should advise you never to hurry to select your fly until you have actually watched a trout on the rise and found out what he is taking.

Don't use a lot of floating mixture on your flies. It is better to use none if you can make them float without this help; if you cannot, dry them well after applying the paraffin (or whatever your favourite brand is), or, better still, apply it overnight to a selection of the flies which will probably be wanted, and leave them to dry on blotting-paper. A fly treated in this latter way is almost unsinkable, and will not exude a scummy circle on the water like a freshly treated one.

A last word—moorhens are simply wicked on trout-spawn and trout-fry. Furthermore, I believe it to be now an established fact that they eat ducks' eggs as well as the eggs of any other birds which they come across. Moorhens' eggs need not be wasted, as they are most excellent to eat.

THE MYSTERY OF THE *WELL MET*.

CHAPTER VII.—A MIDNIGHT SWIM.

THE brief twilight passed, the night fell, and overhead the stars shone out, one by one. There was no moon, and only the faint, uncertain light the stars gave mitigated the close and brooding darkness of the heavy night. An hour passed, and another, each one an eternity of torment to Hervey, lying helpless in his bonds. His wrists were bruised and bleeding with the efforts he had made to wrench them free from the encircling steel that held them. Like one possessed he had torn at the cable-length fastening his foot to the deck, but the attempt was so evidently futile that when his captors saw what he was doing they merely laughed, and allowed him to continue. Now, such useless struggles long abandoned, he crouched upon the deck and revolved a hundred wild schemes in his mind.

'No good,' he said to himself at last, very bitterly—'no good trying any more,' when there came to his ear a sound so low and faint he was not even sure that he had heard it.

Yet he listened, and it was repeated, and at the head of the after-hatchway appeared in the darkness a dark shadow, moving cautiously, gliding silently, till it came so near to him he was able to see that it was Lucy, wearing a long cloak that covered her from head to foot.

'Hist!' she whispered, as once before he had whispered to her through her cabin door, and he realised that, intently as he had been watching her, he had not moved, and that she did not know if he was asleep or awake and aware of her approach.

He lifted his hand, and she saw it gleam faintly through the dark, and crept a little nearer still.

'Are they asleep?' she murmured.

'Yes,' he answered, and still he had no hope, for he knew she could not possibly release

him without wakening their enemies. 'Yes. I meant to save you, and I have done nothing—less than nothing—and now there is no hope any more. Forgive me for thus failing to help you.'

'You did everything,' she answered gently, 'when you let me out of the cabin, for I got the key and hid it while they were attacking you. That is how I got free to-night.'

'What will you do?' he asked. 'They have fastened me up like a rat in a trap—look. What will you do?'

He shuddered as he spoke. He saw but one dread course for her to follow if she was to escape worse than death. Yet at that he dared not even hint. Perhaps he had spoken a little too loud, or else her movements, cautious as they had been, had disturbed the sleepers, for on a sudden Drew jumped to his feet.

'Who's that? Who's there?' he shouted.

She did not answer, but sprang up, and with one swift and light bound reached the side of the ship.

For one instant she stood there, supporting herself with one hand upon the shrouds, her form outlined against the dark background of the night. Then, with a quick movement, she flung aside the long cloak she had worn, and sprang into the sea.

Clear in the quiet night sounded the splash of the parting waters as her body cleft them asunder. From the ship they could see her plainly for a moment or two as she rose again to the surface and struck out vigorously. Then the darkness covered her and the night took her to itself. On the ship her four enemies looked oddly at each other, while Hervey hid his face in his hands and prayed silently.

'What shall we do?' Drew said at last. 'Shall we lower the boat and go after her?'

'No,' answered Wilson with a curse. 'What would be the good? We should never find her in this darkness—and, besides, most likely she's drowned and dead by now. If not, a shark will have her before long. We are well rid of her, I dare say; but I wonder how she got loose.'

They talked for a little, and then lay down again, paying no attention to Hervey, and confident that the death Lucy Endicott had evidently sought she must have soon found. Nor to the helpless Captain Endicott lying in his bunk below did they give so much as a thought.

But both Hervey on deck and Captain Endicott below heard come to them from out of the heart of the darkness a very faint and distant murmur, scarce audible—the whisper of the waves as Lucy swam straight ahead, parting them before her.

All around her the enormous night brooded on the surface of the waters. The loneliest of all created things in the midst of that vast trinity of sea and sky and night; helpless, indeed, before their immensity, but all her soul aflame with a great resolve that made her greater even than the great three surrounding her, she neither faltered nor fainted, but still swam on. Dark and solitary might be the night, vast the trackless spaces of sea and sky wherein she struggled alone, but a purpose burned clear in her mind, sustained her loneliness, made her weakness strong, and turned her terrors into steadfast courage.

The water was warm; the soft breath of the night scarce troubled the calm surface of the sea. Above shone the bright, imperturbable stars that she, a sailor's daughter, had known from childhood, the stars to which she trusted for guidance on her desperate and doubtful way.

She swam on with a steady, regular stroke, unfaltering, unafraid. Once a plank floated by, and she clung to it for a few moments to get a little rest. Once she felt some seaweed brush her side. Once she imagined that she heard the flapping of the wings of a bird overhead. But for the most part she swam on through the heart of that tremendous and awful solitude of night and silence, and was aware only of the soft lapping of the little waves about her and the shining of the stars so far above.

There were sharks in those waters, she knew well, fellow-swimmers with her in the night, but of them she tried not to think. It might well be that none would cross her path, or, if one did, the great brute might be made distrustful by so strange an encounter, and not dare to attack her.

On and on she swam with her steady, unchanging stroke, till at last it came to seem to her that never had she done anything else, and that all existence was nothing but progress like this through an impenetrable darkness over waters waiting to engulf her, waiting the inevitable moment when she would have no more strength and must yield to their persistence.

When she had gone perhaps two or three miles, she raised herself a little in the water and looked back. The schooner had been for long invisible, and the majestic solitude of the sea and of the night enveloped her on every side as a mother encompasses the babe at her breast.

Before, behind, on every side the darkness lay, and from very far above the stars shone unperturbed.

She still swam with the same regular and steady stroke, guiding herself by the star she had fixed on before she started—the star which, she knew, shone right above the entrance to the harbour of Manilla. But still it only gave her her direction, nothing more, and she knew well that in that darkness she might easily swerve a little too much to one side or another, and swim on and on till her strength was exhausted or a current seized her and bore her away, or till at last some prowling shark discovered its helpless prey.

She had gone a long way now, and fatigue began to press her down and down with a heavy, invisible, irresistible hand, and yet she knew

she could have completed scarce half the distance she had to cover.

As she swam she heard a faint splashing sound in the water only a yard or two away. She could see nothing, she heard it not again, and yet she was certain something swam there, something chill terror told her was a shark at last.

She supposed that was the end. She waited the great fish's rush, but none came; only a splash and movement in the water was repeated at a slightly greater distance.

After that she heard no more. Steadily she swam on, her gaze fixed upon the star she had chosen as her guide, so that she might see it last of all if, presently, her fate came upon her out of the darkness, out of the night and the ocean.

She had covered, perhaps, another mile, and had come very near to the point of utter exhaustion. Her limbs were like lead in the water; now and again her mouth and nostrils sank below the surface, and she knew well that the time must soon come when she would not be able to lift them above it again. Warm as was the night, a deadly chill began to creep all through her body, and as she swam she babbled sometimes to herself of far-off days, and she knew no longer what she was doing or why she swam like this, far out at sea, at midnight beneath the starry skies.

Yet still she remembered the one star she had taken as her guide; still her limbs moved mechanically; still the water parted before her to give her way; and still the depths of the ocean took her not yet to themselves, since her time was not come.

More slowly, and more slowly yet, she swam on—and on the deck of a small American gunboat lying off the coast said one sailor of the watch to another, 'Do you hear anything?'

'Must be a fish,' the other answered.

The first man did not reply. They listened idly, leaning on the rails, and puzzled by the faint sounds they thought they heard, till on a sudden from out of the darkness a voice, very weak and low, called, 'Ship, ship ahoy!'

For, even as she came to the last of her strength, Lucy had seen loom up before her like a white wall rising from the sea the side of the gunboat, and with almost her last breath she called again, 'Ship, ship ahoy!'

'Who's hailing us?' called the voice of an officer from behind.

'I—I don't know, sir. It's something in the sea,' stammered one of the men.

'What do you mean?' growled the officer angrily, and taking up a lamp, he threw its white beam across the sea whence the voice had come. By its ray they all distinctly saw Lucy as, exhausted at last, she sank slowly beneath the surface.

But they had seen her, and that was enough, and two of them were overboard on the instant, swimming to her aid. On deck sharp orders rang out, and the two swimmers had scarcely made a dozen strokes before a well-manned boat had touched the surface of the water, swung out from the gunboat's side. Lucy, unconscious now, rose again to the surface and floated face upwards. The two swimmers reached her almost together. In another moment they were all hauled on board the boat, and Lucy was quickly wrapped in warm, dry coats. Swiftly her wondering rescuers transferred her to their ship and put her under their doctor's care.

By good fortune she had swallowed comparatively little sea-water, and her breathing never ceased. Very soon, under the doctor's skilled ministrations, consciousness returned, and the first thing she did was to point to an oilskin packet secured round her neck. They understood she meant them to open it, and when they did so they found within a brief account written by Captain Endicott of what had happened and an appeal for help, together with a statement, as accurate as he could make it, of the schooner's exact position.

Things move quickly on board a man-of-war, and in a very few minutes the gunboat's motor-launch was speeding away on her errand of rescue. Nor was it long before Wilson and his companions heard the sound of her engines as she came rushing towards them.

'Some one seems in a hurry over there,' remarked Wilson idly. 'Guess we're about ready, aren't we?' he added.

'About,' answered Drew, neither of them dreaming of the avenger bearing down upon them. 'We can clear as soon as you like. Don't know as we want to get ashore such an awful lot before dawn.'

'So we sha'n't, if we start now,' Wilson said. 'It's a fair piece to row. That infernal noisy thing over there is coming right down on us,' he added, with a faint touch of uneasiness in his voice.

'Our lights are burning,' said Drew. 'She can see us, I suppose.'

She could indeed, and with the dexterity of skilful sailors the crew of the launch brought their little craft alongside and swarmed on deck before Wilson and his companions well knew what was happening. Taken by surprise as they were, they tried to offer some resistance. Wilson drew a pistol, but it was knocked out of his hand. Jacques flashed out his knife, and was himself knocked down with a blow that left him helpless and half-stunned. The other two were seized where they stood, and their two victims, Hervey on deck and Captain Endicott below, were quickly released and attended to.

'You would have had a mighty slim chance,' remarked the officer in charge of the rescuing-party as he surveyed the very thorough preparations that had been made for firing the ship. 'If once a match had been put to this, she would have been ablaze from end to end in

quick time. Lucky for you that girl made good. And, gosh! it was some swim, too.'

. . . . . .

At the trial of Wilson and his companions for murder and piracy on the high seas it was shown that they were escaped convicts from the French penal settlement on the island of New Caledonia. They had managed to get hold of a boat and escape to sea, and had been nearly at the end of their resources when the schooner *Well Met* sighted them and unfortunately rescued them, whose only thought was to plunder and murder their rescuers. Wilson's life was already twice forfeit. The crime of which he had been found guilty, and for which he had been transported to New Caledonia, was the murder in Paris of his wife and another woman. The records of the other three were nearly as bad, and all four of them paid the last penalty for the atrocious crimes they had committed.

Captain Endicott never went to sea again. He offered the command of his little schooner to Hervey, who accepted it the more gladly that thus he made sure of seeing Lucy again, and of opportunities to urge his suit, since it had come to seem to him that unless he could win her hand and heart, the life that she had saved would be worth very little to him. But she, when he urged this, retorted that in reality it was he who had saved them. How they decided the point does not seem very clear; but, anyhow, they came to a satisfactory conclusion, which they ratified on the day when they joined their lives before the altar of God, and, on leaving the church, passed out through a guard of honour supplied, by special permission, by the sailors of an American gunboat that had come into port only the day before.

THE END.

'RESPICE FINEM.'

By BERNARD W. HENDERSON, D.Litt.

I.

THE Eight came swinging down-stream. Above the lasher the voice of the cox rang out clearly. 'Easy all!' he cried; and then, in a few seconds, came his orders in quick succession: 'Hold her gently, all! Easy holding! Back her down, five and seven! Paddle on gently, two and four!'

As the boat turned, the boy at stroke glanced along his oar as it lay idle on the surface of the water. The blade was moving round now scarcely a yard from the bank, where the summer sunshine was glinting through the willow-branches, lighting up little cavities where the willow-roots reached the water, dancing on twigs, and small stumps, and stones. On a sudden the boy saw a sharp black eye peering at him out of a sunlit hole; then the brown nose; then, in a vast hurry, a furry water-rat leapt from the willow-trunk into the stream, and the little, scared beastie went swimming away down-stream for dear life.

'See him, seven?' he asked over his shoulder. But at that moment the coach rode up along the towpath, and the serious business of the afternoon began again.

'Much better with the beginning, stroke!' shouted the coach; 'but you *must* be careful to finish it out long and hard, and give the men behind you a chance. Specially when you get a bit done. Do think of that finish. All right, cox.'

'Come forward!' cried the cox. 'Are you ready? Paddle!'

The Eight went gaily up-stream again, and disappeared round a bend of the river.

II.

It was a few years later, and the master sat in his study, as the afternoon sun came streaming through the window. In his hand was a letter. He turned over the thin sheets of foreign letter-paper, and continued reading:

'So I was sent on in a hurry with a small lot to see what was up. It was a beastly country, great, bare, rolling, dusty hills, and fiendishly dry and hot. That evening we camped just this side of the top of a ridge. My scouts came in and reported that the tribes were gathering on the hills all round in front, and were as restless as you please. Just over the ridge the hillside sloped down to a dry river-bed, and along its bottom ran an old ruined stone wall, which would give some cover. There were big boulders, too, dotted about the downward slope. From the valley the hillside went up beyond as bare as your hand, they said; no morsel of cover; and there at top was the mud-fort, just chock-full of lively natives with rifles galore and whole stacks of cartridges. No machine-guns, though—thank the Lord for that. Their friends on the hills round were just about ready to come in and lend a hand to 'em.

'Well—of course, I could have waited for the guns, and then have blown that blessed mud-fort sky-high in a few minutes without even looking over the top of my ridge. But the guns were a couple of days at least behind, and meantime——

'Anyway, I thought, as we had made a start, we had better go through with it. So early next morning we all went over the ridge, top-speed, you warrant, and down to the wall. They

opened on us at once, but we didn't leave many behind on the slope. At the wall I halted the men to get their wind again. And just then things looked a bit blue. The bullets were coming down the slope opposite from the old fort like billy-oh, and rattling on the wall like hailstones on an umbrella. The whole crowd of 'em in the front were howling and yelling like dancing Dervishes, and not an inch of cover beyond that jolly old wall. The men were getting a bit jumpy and rattled, I fancy, and I lay there myself, I don't mind saying, sweating and hesitating like a stuck pig.

'Just then I saw a brown nose and a black bead of an eye looking out of a hole in the wall, and, plump! out shot a brown rat, and went off top-speed down the wall. Something of a pace he showed, did that beast. And all on a sudden, somehow, I thought of the river and the boat, and a jolly old vole I saw there once by the lasher. And I heard you cursing me for my rotten finish. And I just yelled to the men, "Come on, finish it out hard!" So over the wall we went, and up the hill, and into the fort. It didn't take long to settle the job. And the tribes round came in that evening. Weren't the gunners sick when they turned up too late for the fun!

'How is the boat doing . . .?'

A knock at the door interrupted the reader, and in came a friend.

'Come out for a round, Boyce,' said the newcomer. 'It's a first-class day.'

'Sorry,' said the master. 'I should have liked it. But I promised to take the boat this afternoon.'

'Oh, that boat!' cried his colleague discontentedly. 'You just live for it, I believe. Your game is going to pieces. And what earthly good does it do the boys when they leave school, anyway?'

'Clearly, none at all,' laughed the other. 'By the way, here is a letter from Colin Hadland from the North-West Frontier you may like to see.'

'Hadland?' said his friend. 'Oh yes; stroke of your blessed boat some years back, wasn't he? But just look at the sun, man. Won't you come?'

'A promise is a promise,' said the master.

THE MONTH: SCIENCE AND ARTS.

A NEW METHOD OF SEWAGE DISPOSAL.

ALMOST every town of any considerable size is saddled with a heavy annual outlay for the disposal of its sewage. For obvious reasons, the town sewers cannot be allowed to discharge their contents into the nearest stream or river; while even on the seacoast shell-fish are destroyed or contaminated by the discharge of untreated sewage. The aim of all methods of treatment is to remove the solid matter and purify the liquid, or effluent, as it is called, so that no damage or unpleasant results follow its discharge into streams. The essential portion of existing sewage-works consists of a number of enormous filters, over which the effluent is sprinkled by means of perforated revolving pipes. These filters are composed of clinker, slag, or coke, to the thickness of five or six feet, and arrangements are made at the bottom so that air can circulate freely through them. The actual purification process is performed by bacteria which grow, in the form of a gelatinous mud, on the material of which the filter is formed; but a plentiful supply of air is needed to enable them to carry on their function. This process takes up a large amount of land, involves a big outlay for machinery, and entails heavy charges for labour. Consequently efforts have been made in recent years to cheapen and simplify the process. These efforts have resulted in an improved method which has been greatly developed by Mr John Haworth, F.I.C., F.C.S., the manager and chemist of the Sewage Disposal Department at Sheffield. The method consists in causing the sewage to flow through a channel with an effective length of nearly three-quarters of a mile. During its passage through this channel the liquid is agitated by means of paddles in such a way as to prevent the settlement of the solid matter, and to bring the fluid content in contact with the air at the surface to a sufficient extent to ensure its absorption of the necessary amount of oxygen from the atmosphere. It is also brought into intimate contact with highly oxidised mud containing the purifying organisms, and is thus effectively purified. At the end of the course the purified liquid is run off continuously. Mr Haworth compares the action to that of a river containing a very large number of oxidising organisms capable of purifying putrescible matter. Some of the advantages of the process, compared with existing methods, are: (1) the capital cost is reduced to one-quarter or even one-sixth; (2) the area of land required is reduced to one-third; (3) the degree of purification is greater than that demanded by river authorities; (4) there is no nuisance from smell or flies.

THE STILL ENGINE.

In every gas-engine, petrol-motor, or other type of internal-combustion engine, somewhere in the neighbourhood of 40 per cent. of the heat is lost in the exhaust gases, and 28 per cent. in the water used to cool the cylinders. The Still

engine, which has been developed by Mr W. J. Still, in collaboration with Captain Frank E. D. Acland, M.Inst.C.E., has been devised to minimise these losses. It has long been known that the exhaust gases could be utilised in a steam boiler, and some of the heat recovered in the form of steam, which could be used for heating or power purposes. Another important fact which must be noted is that when steam is generated in a boiler under pressure, the temperature rises with the pressure. In the Still engine, the cylinder-jacket forms an extension of a steam boiler: the steam being, for example, at 120 lb. to the square inch, the temperature both of the steam and of the water in the jacket will correspond to that pressure. The heat from the exhaust gases is also utilised to generate steam. This steam is delivered to the under side of the piston, the cylinder, unlike that of the ordinary gas or oil engine, being closed in at the bottom. The piston is, therefore, driven upwards by steam pressure, which adds to the power of the engine. If the engine is of the two-stroke type—that is, each down-stroke is a working stroke—it is double-acting, the exploded air and oil vapour driving the piston downwards, while the steam drives it upwards. For starting, steam pressure is raised by a burner under the steam boiler. Consequently the engine starts up like a steam-engine through the turning on of a valve, and therefore for marine or traction purposes can start, reverse, or manœuvre as desired. Still engines of 100 and 300 horse-power have been already built, and others of larger size are being constructed. It is claimed for the Still engine that it saves 20 per cent. of the fuel necessary for any other type.

GAS AND OIL TURBINES.

Almost every one must have heard by this time of the steam-turbine, large numbers of these prime movers being employed for the propulsion of ships and for the production of electricity in big generating stations. Roughly speaking, a steam-turbine consists of a disc having a large number of small radial blades round its periphery. These blades are straight radially, but in the direction parallel with the turbine-spindle they have a special hollow curve on their working faces. Steam at a high pressure is blown through a number of jets, set at intervals round one side of the ring of blades, each jet pointing in the general direction of rotation, but at an angle thereto. The result is that the steam impinges on the blades and causes the turbine to rotate at a high speed. The steam-turbine having proved so successful, it was only natural that efforts should be made to substitute turbines for gas and oil engines, and this has now been successfully accomplished. The conditions under which a gas or an oil turbine works are exceedingly difficult, owing to the great heat generated by the explosion of gas and air, or oil-vapour and air. In a petrol-motor, for instance, the heat of the gases in the cylinder when the explosion occurs reaches about 3000° F., or the melting-point of iron. The only reason that no damage accrues to the cylinder and the piston is that they are surrounded by a water-jacket, which keeps them cool. Again, before a charge of gas or oil-vapour and air is exploded, it must be compressed. In the ordinary gas or oil engine this is done by the up-stroke of the piston. In the oil-turbine we are describing, the oil-vapour and air are compressed by a separate compressor, which forces them into the combustion-chamber, where they are exploded by an electric spark. From the combustion-chamber the gas at high pressure is led to the jet and impinges upon the turbine-blades, causing the disc to revolve at a high speed. Exact details of the construction are not available, but water-jacketing is resorted to to cool the gas to a certain extent before it reaches the blades. These are made of special electric-heat-treated steel, and it is claimed that they successfully withstand the high temperature involved. The exhaust gases from oil and gas engines are discharged at a high temperature, and those from the turbine form no exception to this rule. The heat in the exhaust gases is often used to generate steam. In this case the steam is utilised to drive the air-compressor already mentioned, so that the turbine is entirely self-contained. The oil-turbine in question has been built by Messrs Thyssen & Co., of Mulheim, Germany, for the Prussian State railways. A gas-turbine of 1000 horse-power was completed before the war, and is now in operation. At present the efficiency is not so great as that of the best gas and oil engines; but this was also the case with the early steam-turbines. Should these turbines prove successful, they will revolutionise the use of gas and oil for power purposes.

A NEW HAND-WASHER FOR CLOTHES.

Since the washing of clothes by rubbing them with the hands in hot water and soap first came into vogue, many appliances, starting with the well-known dolly, have been invented for lightening this irksome task. Among the most recent is a device which works on the suction principle. It consists of a hollow copper cone, nine inches in diameter at the base or mouth, with a socket at the apex for the insertion of a short wooden handle. Inside this cone is a bell-shaped portion, made of sheet-copper, the mouth of which is about five inches across, and is situated one-and-a-half inches above the mouth of the cone. About half-way up the cone is a diaphragm to which the 'bell' is attached, while an opening at the top of the 'bell' is ordinarily kept closed by an air-valve in the form of a marble. As the appliance is thrust downwards into the tub the air imprisoned in the part of the cone below the

diaphragm escapes into the 'bell' through a ring of holes near the top of the latter. Becoming compressed, it forces up the marble covering the opening at the top of the bell, and finds its way into the upper part of the cone, to escape finally through holes provided for this purpose in the circumference of the cone. These holes are protected by hoods to prevent the air from blowing the water out of the tub. The appliance is worked up and down in the clothes being washed. On the down-stroke, the water is forced upward through the clothes, as it attempts to fill the vacuum left in the bell and in the lower part of the cone. When the appliance is lifted, the marble falls over the hole again, thus preventing the ingress of air at the top, and causing the clothes to cling to the under side of the cone until the appliance is lifted clear of the water, which should be done at every stroke. The forcing of the hot soapy water through the clothes has a strongly cleansing effect. It is advisable to work the apparatus up and down with a steady continuous movement without pressing it quite to the bottom. If the operator does this at the side of the vessel, and gives a slight twist to the handle from the wrist, the clothes will gradually revolve round the tub, and all portions of them will in turn come within the sphere of influence of the worker. The appliance is made in two sizes. It is claimed that the larger size will wash a tubful of clothes in four minutes, and that it will *not* injure the most delicate fabrics. It is also unusually effective in rinsing the clothes, completely freeing them from soap in a very short time. It is, therefore, especially serviceable for woollen goods, keeping them soft and fleecy, and preserving them from shrinking; for soap left in fabrics of this nature causes the fibres to contract, thus leading to shrinkage of the material.

A SILENT FLUSHING CISTERN.

An objectionable feature of the ordinary flushing cisterns to be found in lavatories is the loud gurgling noise which occurs just before the flow ceases. This drawback has now been eliminated in an improved cistern which has recently been placed on the market. The flush is, as usual, worked on the siphon principle, the downward leg of the siphon consisting of an upright pipe, with an open mouth at the top and a water-seal at the bottom, fixed in the middle of the cistern. Fitting over this pipe is an inverted cone-shaped vessel (having a closed top, but open at the bottom), depending from the end of a lever with a fulcrum near the middle, and with the usual chain and handle at the opposite end. The space between the vessel and the upright pipe forms the upward leg of the siphon. The customary ball-cock maintains the water-level just up to the mouth of the pipe. When the handle is pulled down, the cone-shaped vessel is lifted, and the pressure of the air on the fluid in the cistern causes the water inside the cone to rise with it, thus bringing its surface above the level of the mouth of the pipe. The water accordingly begins to flow down the pipe, starting a siphonic action which continues smoothly until the cistern is nearly empty. At this stage, if nothing were done to prevent it, air would rush in under the cone-shaped vessel and destroy the vacuum, with the result that the water in the cone would fall back, and the loud gurgling sound already referred to would be produced by the air bubbling through it. In the new silent cistern air is admitted at a different point just before it would naturally enter at the bottom of the cone. The pipe for the admission of air leads from the cistern at a level which is some distance below the surface of the water when the cistern is full. So long as the cistern remains full, the outer end of the pipe is sealed by a wooden plug, which is forced up against a rubber ring on the end of the pipe by a float acted upon by the upward pressure of the water. When the cistern is nearly empty, the float, no longer supported by this pressure, falls, and allows air to enter the pipe and destroy the vacuum, causing siphonic action to cease silently. The air-admission device, which is the essential part of the apparatus, can be fitted to any existing cistern by an ordinary plumber.

THE INFLUENZA SCOURGE.

A report recently issued by the Ministry of Health on the influenza epidemic which swept across Asia and Europe in 1918–19 contains the startling statement that the disease claimed a larger number of victims than fell during the whole of the Great War. In England and Wales alone the death-roll reached the alarming total of 151,466. Many of its victims were young men, and the subsequent loss to the productive power of the community constitutes a grave social problem. But, apart altogether from the actual deaths, the visitation left in its wake a long trail of sickness. There are numberless men and women whose constitutions have been undermined and whose vitality has been sapped by the after-effects of this dreaded plague. The loss thus entailed to the health of the nation is one not to be computed in terms of recorded statistics. Much good may be accomplished, say the eminent medical men responsible for this report, by public instruction in the practice of preventive methods. The infection of influenza and its allies appears to be conveyed by the secretions of the respiratory surfaces. In coughing, sneezing, and even in loud talking, these are transmitted through the air for considerable distances in the form of fine spray. The channels of reception are also normally the respiratory surfaces of mouth, nose, and throat, though dust, unclean hands, and infected materials may be the means of conveying infection. It is mani-

fest, therefore, that the closer the bodily contact, the more readily will transmissions occur; hence the paramount importance of reducing the opportunities of infection by avoiding overcrowding and thronging of every sort, whether in places of public resort, public conveyances, or factories. Well-ventilated rooms, nourishing food, and an open-air life afford some defence, and in times of prevalence of respiratory catarrh or sore throat the frequent use of an appropriate gargle and nasal wash (for example, twenty drops of liquor sodæ chlorinatæ in a tumbler of warm water) may be recommended. At the first feeling of illness or rise of temperature the patient should go to bed at once, remain at rest and in warmth, and place himself under medical supervision, for it cannot be too clearly understood that it is the complications of influenza which disable or destroy life.

AN UNSUSPECTED DANGER.

Danger lurks in many unsuspected quarters, but few would dream of the blacksmith's smithy or the tinsmith's or plumber's workshop being a source of danger to the health of the community. Yet the researches of Dr James Gairdner, Medical Officer of Health for Crieff, begun more than a quarter of a century ago, and recorded in a recent number of the *Lancet*, clearly indicate that they must be so regarded. He has found that the hot, almost invisible, wide-spreading fumes emitted from the chimneys of such workshops are charged with a certain percentage of benzine and naphthalene and of certain metallic poisons, especially manganese compounds; and that these, through being inhaled, are apt to produce in course of time profound disturbances of the integumentary, respiratory, and nervous systems, leading ultimately in certain cases to various forms of skin disease, rheumatism, pneumonia, and even cancer. As a preventive measure, Dr Gairdner suggests that every such chimney should be provided with a cap or hood, on which the poisonous compounds would be deposited.

'WEALTH AND WORK.'

Probably few things would tend more to further the nation's welfare than a sound knowledge of economics on the part of all classes of the community. We extend a special welcome, therefore, to a little volume in Philips' New Era Library, entitled *Wealth and Work—An Introduction to Economics*, which comes from the pen of Mr George W. Gough, M.A. Written in a pleasant and attractive manner, it sets forth with simplicity and lucidity the laws which govern the production, distribution, and exchange of commodities. It does not, of course, pretend to cover the whole field in detail, but merely gives in broad outline, with many telling and felicitous illustrations, the main principles of economic science. So far as it goes, however, it is admirable, and fortunately it inculcates nothing which has to be corrected or unlearned at a later stage. Useful companion volumes in the same series are *The Gateways of Commerce*, by J. Fairgrieve, M.A., and E. Young, B.Sc., and *England in Her Days of Peace*, by Eleanor Dooley, M.A. The former is an excellent introduction to the study of industrial and commercial geography, not the least of its merits being the unconventional lines on which it is planned, and the help which it affords the thoughtful citizen to view aright the geographical considerations governing many of the economic problems of the present day. *England in Her Days of Peace* is an equally valuable introduction to industrial history. It is a record, not of the striking deeds of kings and nobles, but of the ordinary work-a-day life of the people at large, and, in Milton's well-known phrase, shows conclusively that 'Peace hath her victories no less renowned than War.'

'NEW LAMPS FOR OLD.'

The householder whose abode is lighted by electricity must often feel annoyed at having to throw away as utterly useless lamps in which the filament has broken or has been burnt out, though the rest of the lamp is still in perfect condition. Such annoyance may now become a thing of the past, as a process has recently been brought out by means of which these hitherto useless lamps may be made equal to new. A circular cut is made round the glass bulb near the brass cap, and the portion of the bulb thus cut off is carefully removed and laid on one side. The filament is then renewed, and the cut-off portion of the bulb is welded on to the lamp once more, the necessary vacuum within the lamp being created at the same time. This process effects a considerable saving, as the cost of renovation is much less than the purchase price of a new lamp.

To Correspondents who wish fuller information regarding new inventions, publications, &c. mentioned here, addresses will be furnished, when possible, if (*a*) a reply post-card, or (*b*) a stamped and addressed envelope or post-card, be sent to the Editor, 339 High Street, Edinburgh. To avoid delay, requests of this kind from correspondents abroad will be forwarded to the manufacturer or agent.

*** TO CONTRIBUTORS.

1st. All communications should be addressed to 'The Editor, *Chambers's Journal*, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

WHO KILLED GRABASKY?

AN ADVENTURE OF THE 'INTELLECTUAL' DETECTIVES.

By R. S. WARREN BELL, Author of *The Blairs Rope.*

PART I.

I.

IT was the duty of the 'Intellectual' branch of the C.I.D. to THINK rather than to act; but should the necessity to act arise, doors opened to it and closed after it in a marvellous way. One great step forward was taken in the employment of the I's—as Scotland Yard knew them; they were not called in after the Yard had been baffled, but, as a rule, before the regular detectives commenced operations, since their office was to set the Yard on the right track from the start. They were found most useful, owing to their use of deduction and logic, in supplying MOTIVE, which often provides a puzzle for the most astute detective.

In the following study of their methods, the central figure of the case under investigation being a scholar, two other scholars were enlisted to unravel the mystery.

Churton Gilbert, philosopher, wit, poet, novelist, and playwright, was sitting at work on his shady lawn at Heatherfield one fine morning in September, when he espied a familiar figure advancing towards him. It was that ecclesiastic who, in spite of his unceasing jeremiads, his incurable propensity for looking on the worst side of everything, his crystallised belief that England was not merely going but had gone to the dogs, was yet one of the most popular men in the country, Canon George Smith—known to the irreverent as 'Misery Smith.'

Though there was a difference of some fifteen years in their ages, he and Gilbert were great friends.

Having anchored his huge bulk to a chair, Churton Gilbert was never in a hurry to slip his cable. Without rising, he held out his hand. 'Good-morning!'

A girl, so slim that in her white frock she looked a mere spill beside her leviathan employer, was sitting before a tiny typewriter at a tiny table.

Gilbert glanced at her. 'Take your baby indoors, Stella,' he said, 'and type those passages I have given you. They must be posted before lunch. And don't forget, my child, what I have told you about "i—e." The rule is——'

'"I" before "e" except after "c,"' replied the girl, with a smile and a blush—for the canon was viewing her with restrained approval.

'Good!' Gilbert waved a fat hand. 'I train my secretaries to perfection, my dear Smith, and then they leave me to——'

'Train another?'

'No; to be married.' From Gilbert's throat came a clucking like to that of a hen. In an ordinary man it would have been a deep-chested laugh. But it was his most boisterous cachinnation. 'Some writer-fellow marries them for their brains.'

Miss Stella picked up her baby typewriter and flitted in.

'Well?' Gilbert's manner changed. 'This is a very horrid start Grabasky has given us—to be murdered in weather like this!'

The canon sank into a chair. 'I was more grieved than I can tell you,' he said. 'What is the world coming to? Of all the harmless innocents—to lose that fine scholar and gentleman at the hand of a vulgar assassin!'

'Or polite one,' put in Gilbert quietly.

The canon looked hard at him. 'You imagine, then, it is not a case of a mere footpad after his currency-notes? It looks like that.'

'If it was currency-notes the footpad was after, he got few. I have seldom known a man go about so unprovided with ready cash as our late friend did. When he was in London—at King's College—he used to go out to lunch every day to the same restaurant, eat and drink what was put before him, and wander out again without thought of payment. At the end of the month they would present him with an account, which he paid with a cheque, invariably omitting, as Royalty does, the shillings and pence. No doubt, however, they carried forward the difference, and it was paid in the long-run.'

Again sounded the cluck.

'You know, Gilbert,' said the canon, crossing his knees, clasping his hands, and assuming a

 [*All Rights Reserved.*]

serious expression, 'you strike me as being a little callous. Yonder—under thirty miles away—an old comrade of ours lies stiff and stark with a bullet-wound through the heart—snatched away in his prime. And yet you can joke!'

'I grieve as much as you do, friend, but I show it in a different way,' said Gilbert, as a page-boy issued from the house bearing a tray containing a veritable mound of beef-sandwiches and a quart bottle of stout. 'Ah, here is my "snack." Will you join me?'

'Thank you,' said the canon severely, 'but I have already breakfasted, and in about an hour and a half's time I hope to lunch.'

'So do I,' said Gilbert, uncorking the stout and attacking the sandwiches, 'but a little "stay" in the meanwhile does no harm. While I clear up this trifle you might read me what your paper says about poor Grabasky. It may have something that mine missed.'

The canon drew a newspaper from his coat-pocket. He read:

'"OXFORD PROFESSOR FOUND SHOT—FOUL PLAY SUSPECTED.

'"As we go to press we learn that about a quarter past ten last night the village of Nettleby, situated six miles from Oxford, was startled and shocked by the discovery, by a local constable, of the body of Professor Edmund Ericson Grabasky, who held the Chair of Biblical Psychology at the University of Oxford. Only brief particulars are to hand, but it appears that the cause of death was a bullet-wound in the region of the heart, and the absence of any weapon points to foul play. So far robbery is suspected as the motive of this dastardly crime, as, although letters and papers establishing the victim's identity were found on the body, not a shilling of money was in his pockets. The body was found lying near to what is known locally as the Weir Gate, forming part of the boundary of the estate of the widowed Countess of Loamshire, the tragic death of whose husband in the hunting-field some few years ago will be recalled. The scene is in keeping with the deed, for the path leading to the gate is overshadowed and sunless.

'"Some years ago the unfortunate scholar took The Dene, an old house standing over a mile from the spot. It was not generally known that the professor had returned from his long-vacation trip to Switzerland, during which time The Dene had been left in charge only of an elderly married couple who acted as the deceased's domestics.

'"These are the bare particulars to hand. In conformance with the new policy now adopted, we understand that the aid of Scotland Yard was immediately enlisted."'

'And, incidentally, that of the "I's,"' observed Gilbert, munching stolidly.

'Yes, the chief sent to me by messenger at breakfast-time,' said the canon.

'Well, I have left four sandwiches for you,' said Gilbert, as he rose, 'and half the stout.'

'My dear fellow, I couldn't touch anything. This news about poor Grabasky——'

'Pooh! Starving yourself won't bring him back to life. Besides, you won't get any lunch, because I'm going to order my thing out, and we will hie straight to the scene of the tragedy, and pursue our investigations on the spot.'

'How will the police like that? We are supposed to make suggestions only.'

'What suggestions can we make on the strength of that bald and sketchy announcement?' demanded Gilbert, pointing to the newspaper. 'I prefer to work my investigations from my arm-chair, I admit, but this time it is different. You'd better have a snack.'

And he lumbered down the lawn to order his car, or 'thing,' as he quaintly termed it. And the canon, thinking better of it, finished the sandwiches and stout. Knowing his friend's methods, he invariably found that behind the clucking and the 'snacking' and the apparently callous jocosity, there was hidden a plan which, pythonwise, gradually uncoiled itself. The canon was a clever and learned man, but a babe indeed, as regards creative thinking, beside the mountain of flesh and mental gymnastics known as Churton Gilbert.

In five minutes the car was ready, and in six the two 'I's' were speeding through the cherry-orchards in the direction of Nettleby.

II.

The way to Nettleby from Heatherfield, once the cherry-orchards are left behind, is lonely and unpicturesque. There are few houses. It is a bit of country to hurry over, and hurry is possible, as it is an unlikely area for police-traps.

During a breakdown, while the chauffeur was executing the necessary repairs, the two Intellectuals had some conversation about the case which proved enlightening to the canon.

'Of course,' said Gilbert casually, 'the lady cannot have had anything to do with it, but it is curious the body was found by her Weir Gate. Grabasky was in love with her.'

'Grabasky—in love!'

'Yes. The tender passion is no respecter of persons, you know.'

'And—did she return it?'

'I believe he went to Switzerland to try to get her out of his head.'

'Indeed! She is attractive, no doubt? I have never met her.'

'Nor I. Yes, according to report, very attractive.'

'And wealthy?'

'Extremely.'

'Then a middle-aged Oxford don would hardly be much of a "catch"?'

Gilbert clucked. 'You are getting quite slangy, George. Comes of writing articles for popular papers—which means you have to read 'em. But what has my man found in the hedge?'

The chauffeur had gone to the roadside to find a piece of stick to probe with. Having got what he wanted, he had lingered to examine what appeared to be a specimen of headgear.

It was a cap, similar in shape to the bonnet worn by certain Scottish regiments, but of khaki, and innocent of the ribbons which flutter so takingly from the Celt's cranium.

'Looks like a convict's cap, sir,' the man said to Gilbert.

'It not only looks like it, but is one,' said the sage of Heatherfield. 'Put it on, George.'

The canon, smiling, took off his wideawake and donned the khaki cap.

'It suits your clean-shaven, ascetic face. With a khaki tunic, breeches, gray worsted stockings, and thick boots, canon, you would look rather like a solicitor doing "time" for annexing some maiden lady's money.'

The canon hastily threw the thing into the road.

'Pick it up!' cried Gilbert hastily. 'It may be useful.'

The chauffeur retrieved it and handed it to him. Gilbert shoved it into his coat-pocket. 'Where there is a convict's cap, my dear George,' he said, 'there should be, not a thousand miles away, a convict. I keep this.'

The repairs done, the car was set in motion again. Some little way farther on they met a policeman. Gilbert stopped the car.

'Constable, one moment. Have you by any chance been informed of the escape of a convict recently?'

'Yes, sir. A man escaped from Aylesbury jail last evening.'

'Then this must be his cap. My man found it by the roadside—in the hedge.'

Looking interested, the constable took the cap. 'Thank you, sir. Shows which way he came, anyhow. Could you tell me the place, sir?'

'There are no houses there. In fact, I can give you no landmarks, as it was a plain bit of road, without trees—about two miles back. As we stopped for repairs, there may be a small pool of oil there.'

'Thank you, sir. It will be a point to work from.'

The car drove on, and in another twenty minutes droned up the street of Nettleby village. This was an old-world place of the usual Oxfordshire pattern, low hedges, few trees, and a wide expanse of pasture-land. Right in the middle of the village stood a small, rather new-looking brick house labelled 'Police-Station,' the royal arms over the doorway lending a touch of splendour to the modest edifice.

'We must report here,' said Gilbert. 'Have you our "chit"?'

'Yes,' the canon answered. 'The chief sent it with his instructions.'

'Then perhaps you will announce our arrival.'

The canon drew from an inner pocket an official buff envelope, from which he took a form containing a few written words and a signature. Knocking at the door of the police-station, the canon handed this form to the constable who opened to him. The man surveyed it in a mystified sort of way, and said, 'I'll tell the superintendent, sir.'

The canon walked back to the car. A minute elapsed, and then from the doorway of the rural police-station issued the imposing figure of a superintendent of constabulary. A touch of disdain swept his sunburnt countenance as he approached the motorists.

'Good-morning, gentlemen! I was hardly expecting you so soon.'

'Good-morning, superintendent. I should tell you that we are not direct from the "Yard." We belong to a special department.'

'So,' said the man, his glance resting on Gilbert's abundant locks and the canon's clerical garb, 'I infer, sir.'

'But it *is* a special department,' said Gilbert, a trifle sharply. 'You will be good enough to remember that. We wish to view the body.'—The canon drew in his breath sharply.—'Where is it?'

People were mistaken who took Gilbert for an eternal clucker, for he could be stern enough when he chose. Indeed, just as he had the bulk of three men, he would seem to boast the mixed nature of half-a-dozen.

'The body, sir, was taken to the nearest public building—a public-house called the "Haven of Rest," not far from the scene of the crime. It is in an outhouse there, awaiting the inquest.'

'I see. Perhaps you will accompany us in the car?'

Gilbert and the canon had been occupying the back-seat of the roomy four-seater. The superintendent got up by the chauffeur, and they set off.

'Is this necessary?' whispered Smith to Gilbert. 'I would rather my last recollection of my friend were of him as he was in life. You understand?'

'You need not go in,' was the short answer.

The 'Haven of Rest'—and cause of much unrest to employers of carters, ploughmen, and others who found it over-restful—was a small, rather forlorn-looking public-house at the bottom of a long hill, a mile out of Nettleby, as you proceed towards Oxford. It was well situated, for cyclists and others approaching the climb would refresh themselves here against the ordeal. The canon stayed in the car, while Gilbert and the police official made their way to the barn.

In the dim light, amid tools, bins of potatoes, and agricultural implements—for the publican

was, in a small way, a farmer as well—lying on a heap of sacks, they found the prone figure of a strongly built man, clean-shaven, the grizzled hair short, the attire the loose, easy, yet well-cut tweeds of a country gentleman. The superintendent, in the brusque manner of a man hardened to ugly sights, had plucked off the sheet which covered it. The lips, slightly parted, showed a set of strong, white teeth. The man was apparently in the mid-forties.

Gilbert gazed long at the still face. Then he picked up one of the lifeless hands and surveyed it casually. 'Thank you. Now we will go to The Dene, I think.'

The sheet was replaced, the door shut and locked by the constable they had found standing guard over it, and, the superintendent returning to his place by the chauffeur and giving him directions as to his road, they set off again.

The Dene was reachable by a narrow, winding lane. It proved to be a farm-house of a sleepy, shambling type that had been transformed years since into a private residence. It stood quite by itself. All was very still here. The distant low of a cow, the tinkle of a sheep-bell, the buzz of a bee, the gay call of a bird enjoying the mellow autumnal sunshine—these were the only disturbances of this little backwater's quietude.

'An admirable retreat for a scholar,' murmured the canon.

'Too remote,' retorted Gilbert. 'I should get the dismals here in the winter, and take to drink.'

They walked up a short, ill-tended drive to the front-door, porched and embowered with late roses. The superintendent rang, and after a little delay the door was opened by an elderly man who looked like a retired Oxford scout—which was precisely what he was. A stout, homely woman stood fingering her white apron a little distance away. These were the caretakers, the late professor's sole attendants.

'We are inquiring into the lamentable death of Professor Grabasky,' said Gilbert, as the man showed them into the dining-room. 'We do not suppose that you can throw much light on it. I understand the professor was expected home. Did he actually arrive here yesterday?'

'Yes, sir,' said the man. 'He got here in the evening, I believe.'

'You believe? Weren't you both here?'

'No, sir; the wife and I were in Oxford, and, returning by the last train, were informed at Nettleby station of what had happened.'

'What time did the professor reach Nettleby station?'

'He wasn't there, sir. Must have come by car.'

'His own car?'

'No; he hasn't one. A friend's, I suppose.'

'When you got home, you found he had been in the house and gone out again? His luggage, of course, would be here.'

'No luggage, sir. But he has rooms in an Oxford college, and may have left it there.'

'By what other signs did you presume he had been here?'

'Well, sir, he had a whisky-and-soda, and a snap of something to eat—some milk-pudding and some fruit; and he had a wash and brush-up, and wrote a letter.'

'Oh! How do you know he wrote a letter?'

'Knowing him to be coming home, I tidied up his study and put new blotting-paper in his pad. He is always particular about that—hates dirty blotting-paper. And on the new white blotting-paper you could see some writing had been blotted.'

'What did it say?'

'Say?' The old fellow looked puzzled.

'Yes. Come! You're an old scout, and up to most games. By holding up the blotter to a mirror you could read the writing clearly. It is a mean thing to do ordinarily—like reading other people's letters—but in this instance not only excusable, but advisable.'

'You mean, after hearing of my poor master's end? No, I didn't think of doing that, sir.'

'I'm rather glad you didn't. But I will do so now. Take me to the study, will you?'

The canon followed them, the superintendent taking advantage of their absence to have a few words with the wife. To tell the truth, the policeman proper was rather smiling up his sleeve over these amateur proceedings. Once get this stout gentleman and the thin clergyman out of the way, and he proposed to start in and find out things. But—as one plays a trout—he was giving them just as much line as they wanted.

The writing on the virgin surface of the blotting-paper proved to be hurried and sketchy. Owing to the ink-pot's having been newly filled, the pen—a broad one—had picked up too much ink with each dip, the result being that much of the hastily blotted writing was indecipherable. Moreover, the horizontal lines were crossed diagonally by others. But in the mirror could be read: '. . . Must meet you . . . insist . . . by Weir . . . or shall call . . . expect . . . now . . . to spare . . . longing. . . .'

All that could be read of the diagonal lines was: 'Priva . . . the Hall . . .'

Gilbert tore off the blotted scrawl. 'The next thing to discover,' he said, 'is the messenger who took this. But that will take time. And the boy or girl who took it would naturally see no connection between the note he bore and what has happened.'

The others following, he strolled back to the sitting-room. 'The professor, then, had some refreshment, washed and brushed himself, and wrote a note. Did he change his clothes?'

'He left none about, sir; so I presume he didn't.'

'Which is his room? I should like to look round it myself.'

'The large room in front—with two windows. Shall I take you up, sir?'

'No, I won't trouble you.' And with astonishing alertness the vast man disappeared up the old, shallow stairs.

He was absent only a few minutes. 'As you say,' he observed, blowing a little as he re-entered the room, 'he left no clothes about. Now, I think, my friend and I will visit the scene of the crime. Is it far?'

'It is but three hundred yards or so,' said the policeman, 'from the end of the lane we turned up to reach here. You cross a stile facing the lane, and follow a footpath to the weir.'

'Right! We will walk. You might at your leisure, superintendent, follow in my car, and await us at the end of the lane.'

'Very good, sir,' said the police official stiffly.

A MAN'S WORK.

By Bart Kennedy.

I.

WORKING on those oyster-boats was a tough, hard business. It was far worse than any job I have ever tackled. Hod-carrying was a pretty hard job, but it wasn't as hard as oyster-dredging. And besides this, the conditions under which one worked were very bad indeed. We weren't short of food. I'll admit that. It was there—all you wanted, of a sort. But the way it was cooked, and the way it was given you, were calculated to take the appetite away.

Our pay was sixteen dollars a month and board. I hear that they are offering seventy dollars a month now and board, and that men can't be got. And I don't wonder at it.

The men were shipped straight from Baltimore in my time, and I suppose the same thing happens now. In my time the men who did the work were all Europeans. Rarely did an American take on the job. He knew too much. The dredgers hailed from England, Ireland, Scotland, and Germany and the countries of northern Europe. I don't remember ever seeing an Italian aboard an oyster-boat.

The captains of the boats were Americans, and so were their mates—foremost hands, as they were called. But it was rarely indeed that an American signed on as one of the crew.

The time I speak of was thirty-seven years ago. And rough business often went on aboard the boats. Captains were ready with their boots and their fists, and it was only a hard man who could keep his end up with them. The Germans—well, the Germans were the poorest-spirited of all the men who ever set foot aboard a dredge-boat. They were the most cowardly fellows I ever met. They could be booted and punched all over a boat, and they would never put up the least sign of a fight. How people like them ever got it into their heads that they could conquer the world beats me. As I say, they would stand anything.

Not so the English lads. They would fight if they were put upon. They were as game a lot as ever drew the breath of life. Fine lads.

But of all the men to get back at the captains and the mates, if they went on the bullying tack, the Irish were the most effective. I do not, for a moment, suggest that they were gamer than the English lads. That would be absolutely impossible. But they were more dangerous. For, where an English lad would take to his fists, an Irish lad would take to anything—a knife, or anything. I've been about some, and the hardest and best men to fight I've ever met were the Irish and the English—each to their own ways and methods.

Both are men.

The best part of the trip was going down the Chesapeake Bay to the dredging-ground. This took from two to three days. It all depended on the wind. We had nothing to do but to flap our fins to keep warm, for the dredging-season was in the winter-time.

The vessels were rigged with fore-and-aft sails, being sloops or schooners—usually schooners. The forecastle—or forepeak, as it was called—was a very small business. From six to eight men had to live in it. And only one man could dress himself at a time. The condition of the forepeak—well, I won't go into that. All I can hope is that the American Government has bestirred itself since the days of which I speak.

As I say, going down the Bay was the best part of the trip. The captain and the mate sailed the boat, and all that the crew had to do was to give an eye now and then to the sheets.

We used to spin yarns and sing songs. The captain and the mate did not try any bullying tactics. That was left till afterwards.

Yes, we had quite a time going down the Bay. There was always a bottle or so amongst us. We always had whisky—rough but invigorating whisky that occasionally led to argument of the direct primitive kind.

But these arguments did not occur too often

as we were going down the Bay. Yarning and singing—that was more our game. And such yarns, too! Salt water undoubtedly quickens the imagination. It produces weird pictures in the mind. It stimulates invention. The yarns I have heard on the salt water! When I think of them, I wonder at the power of invention that was displayed.

Now and then a real sailor—a deep-water sailor—would be amongst us. But he was always extremely sorry for himself in the end. The work was not what he bargained for. A sailor's work—whilst it is often most trying and most arduous—has variety in it. There are times when it is rather slack and easy. There is about it no steady, persistent grind.

Yes, we had a real sailor now and then, who tackled the job just out of curiosity. But one trip satisfied this curiosity. The shell-back saw the error of his ways. Never again! That was his guiding motto so far as dredging was concerned. . . .

Here at last was the dredging-ground. It was dotted all over with sloops and schooners, ranging in size from seven or eight tons to twenty-five or thirty. There they were, tacking and sailing over the oyster-beds. When you were away from it—not doing it—it was an artistic sight. There were the white-sailed vessels, sailing to and fro over the nice green water—the water upon which was shining the pale golden light of the winter sun. It looked very nice. Very nice indeed from a distance. An artist could have made a lovely picture of it. Beautiful little vessels moving upon beautiful green water. When first I saw the scene I was delighted. It wakened up the poetry that must have been fast asleep in my soul. Ah! that first sight of a fleet of small sailing-vessels dredging for oysters! I shall never forget it. And I shall never forget what it led up to!

II.

Dawn!

'On deck, thar! On deck, down thar!'

The raucous voice of the foremost hand was sounding out, shattering our dreams.

'On deck, thar! On deck!'

'Go to ——!' some one growled.

'On deck! On deck!'

The foremost hand was standing on deck above us, shouting down the forepeak hatchway. We had cast anchor near to the shore the night before.

'On deck! Come on, you ——.' The foremost hand was indulging in colourful threats, and at last one of us got up, struggled into his clothes, and climbed up on deck. The others had to wait till he had got out.

Cold! The wind cut like a jagged knife. It was awful.

'Come on! Come on! Stir yourselves, you ——.'

Another head would appear above the hatchway. And another. And another. And now the whole crew were on deck. Toilet? No, there was no such thing as making your toilet. The icy wind that dallied gently round you, and found its way through all the openings and rents and interstices of your garments, was all the toilet you got—and wanted! You needed no souse of cold water to waken you up. That wind was enough. The memory of its icy caress shivers me even now.

The anchor had to be broken out—the awful, beastly, cold anchor. That was the first job to be done. And it was a fearful business. When it was up out of the water, one of us had to go over the side and get a rope round the fluke of it so as to fish it up to the cathead. That, also, was a nice kind of a job for a breezy winter morning.

Our next task was to make sail. Not much of a job that. And then the foremost hand went to the wheel, and we were off to the dredging-ground.

By this time daylight was up to the full. The sun had appeared. But its light was strictly on pale-golden lines. It was an apologetic sun. It looked as if it felt that it had no right to be up at all.

We got breakfast—one man after another—whilst we were going to the dredging-ground. And the dredges were got into readiness.

The dredge was triangular in shape. It was formed out of four strong iron bars. At the broad end was a powerful steel tooth-bar. And also at the same broad end there hung a chain bag. The tooth-bar scraped the oysters into the chain bag as the dredge was dragged over the oyster-bed by the schooner.

There were two dredges. And they were placed amidships—one on the port and the other on the starboard side. Also there were two crab-winches, around the pulleys of which were the stout ropes that were fastened to each dredge.

III.

Here we were, up to the ground. And around us and out from us were other vessels like our own. There was a light breeze, just the breeze for dredging. If it were blowing heavily, the boats could not work.

The captain gave the word, and one of the dredges was heaved overboard. The heaving required a certain skill so as not to foul the rope with the dredge. The foremost hand attended to the heaving of the starboard dredge, whilst a man who had been at the game before looked after the port dredge—where I was working.

It was the port dredge that had been heaved over first, and at the word 'Wind!' from the captain, the four of us who were on that side suddenly began to wind on the handles of the

winch. That winding! it went on and on and on. And on and on and on. And then I felt that there was beginning to be something wrong with my back. And still the winding went on. And now I felt that my back must break. I could feel it breaking. And still the winding went on.

Time is merely a thing of relation. It is something that we have invented for ourselves out of whole cloth, so to speak. A lapse of time extending but a minute or two may seem as a year. And indeed it may have far more significance than a year.

I seemed to be winding on this infernal winch for weeks. But I was still keeping on. And at last I seemed to be used to having my back broken.

Wind! Wind!

Ah! Here at last was the neck of the dredge appearing over the roller that had been fixed flush with the deck of the schooner—and the man who had heaved the dredge overboard leaned forward and broke the dredge in on deck, as the lower end of it was coming over the roller. The winding was over! Actually over! I felt as if I had a grip upon things once more.

There was the dredge. And there was its chain bag, bulging with oysters mixed up with shells.

And now we were at it as hard as we could, picking out the oysters from amongst the shells, and throwing the said oysters between our legs back on to the deck behind us. It was a stooping job, and it wasn't easy; but, compared with the winding, it was easy. In its way it was a kind of a rest. After we had got all the oysters out of the heap, one of us shovelled the shells overboard.

Whilst we were doing this the captain had put the schooner about—given the order to heave the starboard dredge overboard—tacked again across the oyster-bed—and given the order to wind. The starboard dredge was just appearing over the gunwale as we were finishing the culling, as the picking of the oysters from out the heap of shells was called.

Again we were given the order to heave the dredge, and when the schooner had got across the bed the order was again given to us to wind. And again came the spell of back-breaking, and again came the culling.

The captain so timed it that the whole eight of us were, practically speaking, working as fast as we could through the whole of the time—either winding or culling. If we did get a bit of rest in between, it was only for a few seconds or so.

And this kept on right through the whole of the day. There was no stop or 'let-up.' It was winding and culling, winding and culling, winding and culling right up to the setting of the sun. The only time that we were allowed was the time it took us to bolt our food.

IV.

Whilst the boat was running back to harbour we were stowing the oysters below. These were left on the deck through the day, till they had grown into four great piles. By the time we had stowed them away we had got—or nearly got—to our place of anchorage. Arriving there, we let go the anchor, got in the sails, and washed down the deck.

The day was over.

After we had had something to eat, we went and lay in silence in the forepeak. We were too tired to talk. Usually the boat was anchored some distance off from the shore. The idea was to make it difficult for men to escape—to get away. If I could have managed it, I would have deserted after that first day. I should have been put into jail, if caught, for one had to sign on for a month. But that would not have weighed with me at all.

The next day was the same as the day before. In fact, all the working-days were the same—terrible, hard, back-breaking days. But—well, in time I got used to it, for I was a vigorous, powerful young fellow.

But there were some men who could not get used to it. It was dreadful work—the hardest and most severe that I have ever known.

There were days, however, when God was good to us. Days of storm when the boats could not put out to work—when they had to lie at anchor. These storm-days were for us days of luxurious ease. How we used to rejoice when the white-caps came upon the waves! For that meant that there was to be no dredging—it meant the coming of the thrice-welcome storm. The beautiful tempestuous days! How we longed for them.

And the days of severe cold! The days when the boats were ice-bound! These were also days of non-dredging. I think, of the two, that we preferred these days to the days of storm. A bit cold, of course. But that was nothing. The life made one tough and hard.

I was at the work for nearly the whole of two seasons—about ten months in all. I got used to it, and I did not seem to be able to get any other work.

Bullying? Yes, bullying went on. Men were ill-used. And now and then men were killed. Things got so bad that in the end a gunboat was sent down to the Chesapeake Bay.

No, I was never bullied. But, to tell the truth, I once was threatened. I was willing, however, to take a certain risk, and I was let alone. . . .

So they are offering seventy dollars a month for the job now, and there are no takers!

Well, well! Times change.

I had to do it for sixteen.

THE MOUNTAINOUS MR NEUBURG.

By W. DOUGLAS NEWTON, Author of *War, The North Afire, The Undying Story, Phillip in Particular, The War Cache, Green Ladies, Westward with the Prince of Wales*, &c.

CHAPTER VI.

I.

IT was a long journey from North Bay to Winnipeg on the way to Banff, and not an exciting one.

The scenery alternated between the monotonous and the exquisite. Here it was made up of the hard, thrusting rock that seemed to defy the efforts of the tenacious spruce and grass to find a clinging place. Here it gave way to the forest beauties of Nipigon, where, from the gigantic sweep of Lake Superior, trout river and lake stretched back their sparkling floors through the thick, green silences of the woods. Then came the rolling vastness of the great grain-lands running from Superior to and beyond the far Athabasca—that huge empire of the baker's loaf. Not an exciting country to the vision of anybody not concerned in cornering grain, and to Clement Seadon and Xavier Gatineau an old story, anyhow. They were glad enough to reach Winnipeg.

They stopped off at Winnipeg for business connected with their chase. Gatineau anticipated reports and information from the head office at Montreal; and, indeed, both thought it prudent to stop and to plan before thrusting their heads into the complications which must come when they reached Banff and Mr Neuburg.

It was wise that they did this, because not only did they get some news, but, also, they saw the man with his arm in a sling—Siwash Mike.

The news came first; Gatineau collected that. Seadon, after indulging in one of the almost ritualistic hair-cuts of America in the barbers' temple of white and nickel beneath the Alexandra Hotel, was joined by Gatineau in the big dining-hall. Gatineau said at once, 'No news at all of Miss Reys and her companion. They dodged us somewhere in that railway tangle south of North Bay.'

'Is that bad news?' asked Clement.

'Well, no,' said the little detective. 'They're coming along here all right.'

'I like the positive sound of that,' smiled Clement. 'You *are* positive?'

'Sure. They'll follow this big rough-neck Neuburg, an' Gunning.'

'And Neuburg and Gunning?'

'Gone through to Banff.'

'Well, that's as we expected. The rendezvous of rogues, then, is definitely Banff. Miss Reys will join them there—or, rather, all of us. We'll be of the pleasant company too.'

'Sure,' said Gatineau reflectively.

'Well, then,' said Clement, 'all this being as we thought, would you mind telling me what the bad news is?'

'Hey?' cried the little detective, looking up from the soup that is called gumbo.

'You have the "how-can-I-break-it-gently" air. Out with it.'

'It's Neuburg,' said Gatineau quietly.

'Neuburg?'

'He *is* the murderer. He is Nachbar.'

'Well, we've always felt fairly certain of that,' said Clement, after the first thrill of horror that had run through him. 'You mean, the matter is now decided?'

'As certain as we can be from the facts on hand. I've just read a message from The Chief. He's sure. He's been looking at those old descriptions provided by the Oregon police. Adolf Neuburg is Albrecht Nachbar, wanted for murder by U.S.A.'

'Queer that he should be alliterative in *alias*,' said Clement. 'Arthur Newman. Why has he used those initials again, I wonder?'

'Criminals do strange things,' said the detective. 'It's a kink in him, I suppose. P'r'aps Neuburg has a fancy those initials bring luck—that's the sort of thing one finds in rogues. Or it may be an easy way to keep his gang together; his A and N may be so characteristic as to guard against forgery.'

'And it may, after all, be mere cleverness. Many people would not credit him with the daring of using names so similar, and would be put off the trail. But the fact is that Neuburg is Nachbar.'

'The Chief is sure; he sends along warning to be mighty spry in dealing with the feller. He's a tough nut, is Neuburg.'

'I've already learnt it,' said Clement dryly. 'Was the crime a very bad one?'

'Real bad. I kept my mouth shut about it until we could be sure; but it was real bad. The feller he killed was a rich dude in Oregon. There was some sort of crazy bucket-shop deal that this feller—his name was Roberts—was interested in.'

'Did Nachbar or Neuburg appear in the deal?'

'He did not. I see what you mean. His tactics appear to have been the same as now. He didn't show up in the open; he merely played the part of a disinterested adviser to this rich man's orphan, Roberts. Fact is, nobody noticed Neuburg, or Nachbar, as he was then, until Roberts had died.'

'And he died—how?'

Gatineau looked at him quickly. 'He went out on a shooting-trip——'

'Ah, into the wilds,' breathed Clement.

'Yep,' said Gatineau. 'That appears to be his method in these things. Gets people into the wilds. Well, Roberts goes shooting into the wilds—and there is a hell of an accident. His gun bursts, and he is killed outright.'

'And *was* it an accident?'

'At the inquest it was. That was the verdict. But when people began poking round into his financial affairs suspicion became aroused. I needn't go into it all, and, in fact, I have only the outline of the business, but the things that came out were these. First, a big, solid block of cash was missing. Second, Nachbar was linked up with that missing cash. Then people began to hunt for things.

'First, they got no change out of Nachbar. He produced letters and papers by the boxful to show that his dealings with Roberts were straight — forgeries, no doubt, but good ones, especially since the victim was a dead un—you can bettcher life Nachbar was sound on this. He 's the real brainy bad-man, all right, all right. Things were kind of tied up until a fellow from the American Department of Justice began to find the trail of the murder. He found out that Nachbar had been in the very district where Roberts was shooting, at the very time of the murder.'

Clement was rather startled. 'That sounds rather crude for a criminal of Neuburg's propensities,' he said.

'Oh, it wasn't crude. He travelled by a different railway system to a different valley. He didn't even go near Roberts's camp. But this detective, who was nosing round, found that he had stayed at a hotel in a neighbouring valley for a week-end shoot; that he had gone off, early in the morning of Saturday, the day of Roberts's death; that he went out shooting without a guide, and though nobody could tell the direction he went, he had time to go somewhere close to where Roberts's body was found.'

'There were other clues, of course?'

'They began to come down in a blizzard, once they started. Roberts's actions had been unusual on that day. First, he had made his plans to go out shooting to the west with a couple of guides. Then, early, he had got a special delivery letter. After reading that letter, he changed his plans, went out shooting alone, and went east—that is, towards the hotel where Nachbar was staying. His body was found about half-way between.'

'But didn't all this come out at the inquest?'

'The inquest was on a man accidentally killed. These points, such of them as did come out, were passed over as interesting, but not relevant.'

'But the letter—if it made an appointment——?'

'That letter was never found. It wasn't on Roberts when his body was brought in. Everything on him down to his bootlaces was impounded by the Court, but no special delivery letter was found. Some one had taken that letter from his body after his—apparently—lonely death.'

'It must have been signed for. Didn't the Post-Office know anything about it?'

'Nachbar wasn't the one to slip-up over a detail like that. It had been sent from Roberts's home district in a faked name—couldn't be connected with Nachbar or the hotel where he was staying for his shoot. Still, it was a link in the chain of suspicious circumstances surrounding the death. And on top of that it was found the gun that killed Roberts—*wasn't his.*'

'What?' cried Clement in a startled tone.

'No, it wasn't his. It looked like his. It was just the sort of Winchester magazine-rifle he used, but the dealer found the number, and proved it wasn't his. Some one must have swopped guns with him—while he was out, apparently, alone. And the gun he got in exchange for his own was a gun meant to burst and kill, an' *did* burst an' kill.'

'Devilish!' cried Clement. 'And his own gun—was that traced?'

'Did you think it would be? No, it wasn't. It was proved that Neuburg had also left his hotel carrying a Winchester magazine—easy to effect a change, you see; an' when he came back with the same sort of gun on his shoulder, nobody had reason to suspect it was Roberts's gun—then. Moreover, when Neuburg's rooms were searched, it was found that he had kindly left an identical Winchester rifle behind—an' it wasn't Roberts's.'

'An alibi. He could swear that this gun was the gun he used on that murderous week-end, and nobody could prove otherwise.—Has the burst gun been traced?'

'Yes an' no. The makers sold it to a store down in the cattle country, and it was probably bought and sold a score of times before it reached Neuburg. That is a dead end. But, of course, it is only a detail. It is obvious that Neuburg or Nachbar did that murder, though full facts have to be proved.'

For a moment they sat silent, and Clement, anyhow, was appreciating the full meaning of this revelation. Roberts's murder, Heloise Reys's case—how they ran parallel. Roberts was a victim because of his wealth—Heloise Reys was possessed of a million pounds. Nachbar kept in the background—so far as Roberts was concerned, he was an advising friend; Neuburg played the same rôle to Heloise Reys. Roberts had been lured into the wilds; Heloise Reys was, even now, being lured into the wilds. Roberts was killed by a secret, brilliant 'accident;' Heloise Reys—— Clement shivered. He stared at Gatineau.

'I told you,' said the little detective, 'because

I think it best for you to know exactly the ways and methods of this brute.'

'I understand,' said Clement. 'And then there is the brighter side, too. It is certain that Neuburg is Nachbar. He'll be arrested. When?'

'The Chief tells me he is getting a move on already,' said the little detective, and Clement caught a hint of hesitation.

'Does that mean that Nachbar won't be arrested at once?'

'Not at once.'

'But—but that's incredible. He's a murderer, and you can arrest murderers without warrant surely?'

'We can—if we're dead positive they're murderers.'

Clement gave vent to a gesture and an exclamation of despair.

'See here, Mr Seadon,' broke in Gatineau; 'don't you condemn the police in a hurry. Recollect that, keen as we may be, we can't go about arresting folk off-hand. We've got to be sure we ain't running innocent men into jail—an' disgrace. This is complicated. It's an old crime. We don't know whether the American police have dropped it, or caught their man, or have definite news that proves Neuburg isn't the feller we think he is. Until we can be sure we daren't move. We've got to get in touch with the U.S.A. before we can hold him.'

'That's logical, I suppose; but it is also rather terrible. And it will take—how long?'

'A few days at least.'

A few days! Clement stared at the little detective. What might not happen in two days? During part of that time Heloise might be entirely at the mercy of this monster who was capable of a brilliant, cold-blooded murder. She would be at his mercy entirely because of the very candour and trustfulness of her nature. And that being so, those few days meant——

'She's got us, anyhow,' said Gatineau, reading his thoughts.

'Yes, she's got us, and it lies with us to keep Neuburg or Nachbar as busy as any man can be kept busy in these next few days, so that he won't have time to do anything—critical. But I confess I'm rather fearful, Gatineau.'

And a little later in the day things appeared even more disturbing.

III.

Clement Seadon and the detective, Gatineau, had made their way through the underground passage that leads from the great hotel to the railway station. They were to catch the train west to Banff. They were just emerging into the booking-hall, when Gatineau caught hold of the Englishman's arm and checked him.

Instinctively Clement looked ahead.

Seen through the glass swing-doors of the passage, a young man passed towards the platforms, walking swiftly. He was a slim, lithe young man with a dark, aquiline face. And he had his right arm in a sling. There was no mistaking the curious lilting walk, as there was no mistaking the features of the man.

'Good God!' said Clement. 'Siwash Mike! Siwash here—why?'

'*Not* trailing us, anyhow, I guess,' said Gatineau.

'How can you say that?'

'He hasn't the air; an', then, he's got a grip in his hand. He is going to catch the west-bound to join brother Neuburg or Newman or Nachbar at Banff.'

'Perhaps,' said Clement, remembering how they had been tricked before. 'But why is he in Winnipeg?'

'That's easy,' said the detective. 'He probably got in here over the other railway from Cochrane, and has changed on to our line for Banff. But we'd better watch him.'

They followed the half-breed cautiously, and saw him follow the crowd up the steps of Platform 6. There was no doubt about it that he was catching the west-bound. Like a flash Gatineau did *not* go up the steps of Platform 6; he nipped up the steps of Platform 4. They arrived on the railway-level just in time to see Siwash gain the platform. They took cover, and across the station—where the platforms were only a few inches above the rails—watched him. They seemed astonishingly close, but it was obvious that he was not suspicious, and he did not throw a glance their way.

Almost at once Clement said, 'There is something more in this than merely catching the west bound, Gatineau. He's waiting near the exit—for some reason.'

'He's waiting for somebody, I guess,' said Gatineau. 'That's why he's standing there. Somebody who is stopping off the Montreal train.'

Clement's heart jumped. Somebody who was stopping off from the Transcontinental train—who could that somebody be? Heloise? Certainly his heart fluttered. Perhaps, after all, this was the end of the chase. It was quite likely that Siwash had received some message from Neuburg at Winnipeg—he'd know how and where to pick one up—and that message had warned him to meet this train and Méduse and Heloise, who came by it. He thought that quite likely; and then Gatineau said, 'But why that grip? If he's meetin' some one, why that suit-case, which indicates a journey?'

Yes, that was a puzzle. If he was meeting some one, why carry luggage for a journey?

With its loudly clanging bell the great train steamed slowly into the station. Both men watched the half-breed with the keenest attention. He stood there quite passively as the passengers thronged out of the cars. He watched them indolently as they passed him in

a stream. Then with an air of casualness he picked up his grip and strolled towards the train.

'Damn!' grunted Clement. 'Nothing after all. He's just going to board the train. Look here; we must look slippy, too, if we are to travel by her also.'

He picked up his own grip, and began to step out to cross the intervening rails and platforms to the train. Gatineau said suddenly, 'Hold on. Ain't that long scarecrow of a feller interested in our pal?'

Clement shot a look towards the train. He saw a tall man moving aimlessly after Siwash. He probably had no connection with Siwash, but all the same he was moving against the current of departing passengers. And then suddenly Clement, catching a flash of skinny leg and arm as the fellow dodged between the passengers, had an abrupt twinge of memory. Where the devil had he seen that fellow before?

Gatineau caught his arm and lugged him behind a stack of luggage.

Siwash had walked up to the car in which his seat was reserved. He handed his grip to the black porter, and then, after pretending to mount the car, had turned back as though to take one last look at Winnipeg. In that moment he swept the whole of the platform with a searching glance—fortunately he kept his eyes on his own platform. Satisfied that there were no watchers, he turned and stared straight at the skinny man. The skinny man was by his side in a moment.

There was a swift talk between the twain, the skinny one listening attentively, and nodding his head as if he understood. Then Siwash took a paper from his pocket, and the other stretched out his long and skinny arm. And at that gesture memory came to Clement. He remembered acutely such an arm stretching out from a small window, clutching at the pistol-hand of Siwash. 'Heavens!' he breathed. 'The fellow from the glue-factory—from the Sault Algonquin at Quebec! Another of the beasts on the spot!'

(*Continued on page 371.*)

TYPES OF HUMANITY.

II.—ATROPHIC PEOPLE.

By P. Roualeyn Gordon.

ATROPHIC people are the opposite of oxypheric people. An atrophic man is usually tall and slender, or short and slender, but always slender. He has long, narrow fingers, thin hands from palm to back of hand, a stooping, narrow chest, square shoulders, and a crane-like neck. The face is rectilinear, conic at the lower portion, the apex of the cone being at the chin. The face is sunken under the eyes, all the way down to the lower jaw. The forehead is often very large, but the backhead is only ordinary. The complexion is pale-gray, lime-gray, pale-dark, or pale-white. The skin is rough in some, and velvety, cold, and clammy in others. The chest is normally the weakest part in this constitution, although sometimes it is the stomach.

An atrophic man usually dislikes water and bathing, simply because water, cold air, cold moisture, even steam and vapours, have a bad effect on his system. He has a moist skin, and a perspiring scalp, more or less, from time to time, but especially when he is not well. His bones, flesh, and blood are not properly nourished. His bones are large, and require great quantities of phosphate of lime. Hence, although he is a calcium man, his system, nevertheless, runs short of this element; his bones, being hungry for calcium phosphates, are constantly impoverishing his blood and nutritive functions by absorbing the calcium phosphates in the blood; and in his brain he is using up phosphorus so rapidly, in thinking and studying, that it is not long before that organ becomes depleted of vitality. He cannot supply calcium phosphates and phosphorus fast enough. The heat in the atrophic man is constantly generated from the centre of the body to the surface, with the result that he feels cold, more or less, all the time.

A man of this constitution is, because of his constitution, predisposed to certain diseases that other constitutions are not subject to. An atrophic man is subject to tubercular processes; but it is also true that he can avoid them, and reach a ripe old age, even die from a disease to which he is not subject. Those four vital processes—oxidation, circulation, digestion, and nutrition—are sadly imperfect in all atrophic people. When these processes are not functioning properly, vitality is on the ebb, and disease results. Statistics compiled by large insurance companies show that tall, slender, fair-complexioned men who are under weight are more subject to tuberculosis than men of other types. Provided an atrophic man is in the right environment, knows his constitution, and takes care of his health, he will never suffer from consumption, whether he is subject to it or not. Consumption is not hereditary; no child is born with the disease, even when born of consumptive parents. The lungs of children of such parents are intact at birth. Consumption is caused by malnutrition, wrong dieting, insufficient development of the lungs, unhealthy work in insanitary surroundings. The atrophic man has a too small

respiratory area to his lungs, which means that he does not obtain sufficient oxygen for his needs. In watching the breathing movements of the lungs in atrophic people, it may be observed that they do not breathe with the whole chest. They breathe mostly with the central and lower portion of the chest, usually with the central section. Hence the entire lungs never come to their fullest expansion, and consequently part of their blood, if not most of it, is not thoroughly oxygenated. For this reason atrophic people ought to practise deep breathing at all times; otherwise their health will suffer.

An atrophic man is most sick in childhood, and after the age of thirty-five. The first part of his life and the last part are fraught with health disturbances. He is more healthy between maturity and the age of forty, but after forty he is never safe. Certain months of the year are trying months to atrophic people, unless they are in the right climate. Atmospheric changes affect them in a marked manner. A sudden change in temperature may result in sickness. They require warmth, dryness, fresh air in abundance, and plenty of calcium and organo-metallic salts in their diet.

People of this constitution are remarkably bright. They are invariably great students. Their brain runs to activity, but their body is more passive. Hence they are slow in bodily movements and in speech, but very vigorous in thinking and studies. Books, science, literary work, philosophy, mechanics appeal to atrophic people more than human beings, animals, plants, amusement, and recreation. Being of such a reserved nature, they feel out of place in social activities; they prefer solitude and studies.

Mental work agrees with an atrophic man, especially sedentary brain labour, which he can do sixteen hours per day, if necessary, without feeling fatigued. His mind runs to slow detail, scientific investigation, microscopic laboratory work of the most careful nature, philosophical studies, fine mechanical work. No man is more reliable, industrious, accurate, scientific, and practical, or more able, according to individual talent, education, training, &c., as compared with other constitutions, than an atrophic man. Of course, when vitality gives out and the brain refuses to perform its normal functions, when tubercular processes set in, the man is not himself, and can, therefore, not do his best. No man, however, works more faithfully, patiently, steadily than a man of this constitution when he is well. Some men want to sow to-day and reap to-morrow. The atrophic man can wait. He seems to have eternity itself in his very habits. He has fixed moods. Everything seems different to him than to other people. Most people pay no attention to time, but times and seasons are either too slow or too fast to the atrophic man. When he is interested in a certain study or work, he grows impatient when night comes. He would much prefer that the day could be as long as eternity, so that he could always continue with his cherished work or study.

Atrophic people are periodic in their habits. They go on with one thing at a time, for a long time, only to change to something else for a still longer time, when they come back to their former habits. They are increasing in their tastes, likes, dislikes, desires—never satisfied. Their diseases and symptoms are brothers born of the same parent tendencies. Sometimes they may suffer from headache, or stomach trouble, for five, ten, or fifteen years, in spite of doctors, medicines, and everything else; then all at once the trouble disappears for good, when some new pathological complication appears, only to go on unceasingly as their former complaint. Hence their diseases are chronic. An atrophic man is a cast-iron man in mind and thought, nature and disposition, but his weak link is his vitality.

People of this constitution are never understood; they appear different from what they are. Their reserved nature, intellectuality, bashfulness in society, seeming indifference to social frivolity, make them appear cold, formal, distant, and uninteresting; but they are not so. They are magnetic, and yet not magnetic. People do not take to them readily, but after they get to know them appreciate them thoroughly. Atrophic people are much misjudged. They are simply a higher type of people, and do not belong to the ordinary spheres of life. Place an atrophic man where he rightly belongs, according to his capabilities, health, training, education, &c., and he is not awkward, bashful, or timid. He is a giant intellectually, but unless in his proper sphere he does not do himself justice. Of course, there are many types of atrophic people, some being more able than others, some weaker than others, some taller than others, some darker, but, on the whole, having the same relative development of faculties, and the same combination in a temperamental sense. They are skilful, genius-like, resigned, sedentary, trustworthy, but never so successful in business or organising. They can superintend businesses for others better than they can build businesses for themselves. Their talent is far above the ordinary; in fact, some of them are the greatest men we have. They are artistic without being real artists, though some are artists in the highest interpretation of nature art, as well as of fine art. They are, however, constructionists of some kind, or somewhere, either in literature, science, philosophy, law, politics, or mechanics.

Atrophic people dislike to receive favours; they hate fuss, and become irritable when people are helping them. They are, however, strong in great struggle. They have a tendency to be cynical in regard to small things, but optimistic in regard to the future. An atrophic man expects future trouble, but does not believe that

it comes. He has many peculiar fears, inexplicable even to himself, yet he is a courageous man in times of misfortune.

When he suffers from chest trouble he is often cross and surly, yet always sure that he will improve in health. He smiles at the idea that he has lung trouble. He is trustful and hopeful regarding the future. So certain is this mental attitude that a man of this constitution suffering from consumption promises himself great things, expects to live a long time, to accomplish great deeds, even when he is near the grave. Great future optimism is characteristic of tubercular troubles.

AN INDIAN FRONTIER TRAGEDY.

By C. G. Nurse.

I.

A breath of wind, a border bullet's flight,
A draught of water, or a horse's fright.

SUCH are the apparently trivial causes that affect the whole lives of those who serve on the outskirts of the Empire. Had Jemadar Ramchander Sing's last shot been a bull's-eye instead of an 'outer,' the tragedy which I am about to relate would probably never have happened. And if a lock had not gone wrong in the Government Treasury on that particular occasion, it is very unlikely that I should have been in a position to record the story. It is, however, futile to speculate on what might have been; I will, therefore, put down the actual facts.

Some years ago I was serving as second-in-command of a Native Infantry regiment in one of the out-stations of the Quetta district. Our quarters were in a large mud fort, set in the midst of desolation, with a range of barren, snow-capped hills in the background. We were always short-handed as regards officers, but this was perhaps a blessing in disguise, as, with the exception of duty and a little small-game shooting, there was nothing to fill our time. The winter had dragged slowly past, spring was in the air, and we were looking forward to spending the summer months at Quetta among more congenial surroundings. Meanwhile certain work, which had been delayed during the winter by the severe cold, had to be pushed forward, and I found myself under orders to supervise the musketry training of a large party of about one hundred and fifty 'casuals,' which is the term used in the army for men who have been unable to complete the course with their companies. My party consisted of both Hindus and Mahomedans, and I had the assistance of two or three native officers, the senior of whom was a subahdar named Farzand Ali Shah. Of fine physique and handsome presence, he was a man of some education and considerable force of character, and being, moreover, a Syed, or descendant of the Prophet's clan, he possessed great influence in the regiment. As he belonged to my own double-company, I had been in almost daily contact with him for some ten years, and had found him thoroughly trustworthy and dependable.

The supervision of musketry on the rifle-range is one of the most monotonous duties that fall to an officer when he has to deal with men not belonging to his own company. Four targets were in use simultaneously, and for hour after hour I listened to the register-keepers calling out, as each shot was signalled, 'Ram Sing—bull's-eye—*char pint* [four points];' 'Kazim Khan—outer, *do pint* [two points];' 'Hira Ram—*meess—kuch ne* [nothing].'

The first few days everything went without a hitch. Firing at the shorter ranges was completed, and we had reached the 800-yards range, which is the limit at which individual practice is carried out. It must be explained that men are classified as marksmen, first, second, and third class shots, according to the points they make on the range. No decent soldier likes to be a second or a third class shot, as it often involves extra drills and duties, besides a certain amount of ridicule from his more efficient comrades.

A jemadar named Ramchander Sing was shooting at No. 1 target. I knew him to be a poor shot, and, not wishing to make him nervous, I had carefully avoided watching him, and was standing on the other side of the range. Presently Subahdar Farzand Ali Shah, who had been standing near No. 1 firing-point, came over to me and reported as follows: '*Huzur*, I have placed Naik [Corporal] Debi Sing under arrest.'

'What has he done?' I inquired.

'He made a false entry in the target-practice register. I had already some suspicion, and was watching him carefully. Jemadar Ramchander Sing was firing, and his last shot was signalled an "outer," but Debi Sing entered it as a bull's-eye.'

Debi Sing was a young Hindu who had been for a couple of years one of the smartest of the drill-instructors. I knew him fairly well, as he had on one or two occasions brought out a party of men to beat for me when I was shooting in the vicinity of the fort. He was a fine-looking man, standing nearly six feet in height, and rather above the average in intelligence, though his face was marred by a somewhat sulky expression. I knew that he had ambition, as he had appeared before me in school

and promotion examinations. I neither liked nor disliked the man, but in any case I did not wish to see injustice done to him. So I investigated the matter carefully, trying to keep an open mind. After a good deal of cross-examination of witnesses, I came to the conclusion that the false entry had been made deliberately, more especially as the two extra points just saved the jemadar from the disgrace of being classified as a third-class shot, the jemadar being a fellow-casteman of Debi Sing.

When I returned to the fort I reported the matter to the colonel, with the result that, a couple of days later, Debi Sing was tried by court-martial, and sentenced to be reduced to the ranks. The reduction was duly carried out, his N.C.O.'s stripes being, according to custom, cut off in front of the regiment, and Debi Sing returned to duty as a private, looking more sulky than ever.

After the parade the colonel said to me, 'There is no reason why Debi Sing should not complete his musketry course; you had better make arrangements for him to go on with it.'

I consequently gave the necessary orders for him to be included in the firing-party the following morning.

The same evening the colonel handed me an official envelope, saying, 'I have just received this from the Treasury. As you are field-officer of the week, you had better attend to the matter.'

The letter contained in the envelope ran as follows:

'SIR,—I beg to bring to the notice of your kind consideration that I cannot at all open a box in the Treasury, which contains silver coins and notes. Perchance some evil-doer may have attempted robbery of Government money, and I am very frightful that there may be deficiency. I therefore request your Honour to appoint some officer to break open the box, so that I may make verification of the cash.—Your obedient servant, RAM LAL, *Sub-treasurer*.'

'Very good, sir. I 'll see to it as soon as the Treasury opens to-morrow,' I said, and hastily scribbled a few lines to the sub-treasurer to the effect that I would be present at the Treasury about 10.15 next day, in order to see the box opened.

II.

The following morning I rode down to the rifle-range as usual about 7 A.M., examined the targets, and gave orders for the practice to begin. In order that men should not be kept waiting unduly long at the firing-point, I had arranged that they should attend in relays at intervals of about two hours. About 9 A.M. the first relief, consisting of some forty or fifty men, arrived, in the charge of a N.C.O.; among them I noticed Debi Sing, his face clouded with gloom. I felt rather sorry for the man, as he was undoubtedly a smart soldier, and it would take him perhaps a couple of years to regain the position he had lost. I was well aware that, from his own point of view, his only fault lay in his having been found out, as the majority of natives have no sense of honour as we understand it. But I did not anticipate any further trouble, and, in fact, hardly gave the matter a second thought, as my time was fully taken up with the work in hand.

About 10 A.M., after handing over charge to Subahdar Farzand Ali Shah, and arranging to relieve him some time after noon, I mounted my horse and rode towards the white-washed Government offices, in which the Treasury was situated. The native treasurer, a fat Hindu of the *babu* type, appeared to be in great distress. He addressed me in English, saying, 'Sir, I am glad you have come; now we can investigate circumstances of treasure-chest. I much fear that attempt has been made at robbery. I have been in Government service since twenty years, and no such thing happen before.'

'All right, Babuji,' I said; 'let 's get to work at once. Where is the key of the chest?'

'Sir,' he said, producing a bunch of keys, 'I always keep on my body. This key belong to big chest, which contains sixty thousand rupees.'

We entered the strong-room, the door of which showed no sign of having been tampered with. The iron bars of the two small windows were intact, and the window-sills were covered with the dust of many days, so that it was evident that no attempt could have been made to enter the room from that direction. 'Are you quite sure it is the right key?' I inquired, after vainly trying the key in the lock.

'Your Honour, I know the keys as the fingers of my hand,' he replied.

'Very well,' I said, 'we shall have to break open the lock. What tools have you?'

'Sir, I am not skilled in the use of tools,' said the treasurer, 'but I have the blacksmith in attendance.'

'All right; bring in the man the muscles of whose "brawny arms are strong as iron bands."'

'Your Honour means the smith. I am acquainted with the poem, which I learned in my school days.'

The treasurer went to the door of the strong-room and shouted, '*Ho, lohar-ji*' ('O blacksmith').

'*Hāzir*' ('Present'), replied a voice.

'*Andar ao*' ('Come inside').

A small but wiry-looking man entered, carrying a bag of tools. The treasurer requested him in Hindustani to break open the large chest, remarking that my presence would be sufficient guarantee that he was not taking part in any underhand work.

The blacksmith examined the lock, and said

in Hindustani, 'The box must have cost much money; it would be a pity to break it. Perhaps it might be opened. Let me see the key.'

The key was handed to him, and he tried it in the lock, but without effect. Then he produced from his bag a piece of stout wire, twisted it about in the keyhole, and again tried the key, when, to our surprise, the lock yielded, and the chest opened.

The treasurer, perspiring with excitement, took out of the chest a large despatch-box, opened it with one of the keys hanging on his chain, and counted out the notes with a rapidity only attained by long practice. He then proceeded to pour out the silver coins from the bags into his scales, making notes of the amounts, which he added up and compared with his books. When the whole of the rupees had been weighed, he gave a sigh of relief, and said, 'All correct, your Honour. I ask your pardon for the trouble.'

'All right, Babuji,' I said; 'you had better have the lock oiled. I will now go home to breakfast.'

III.

The gong of the quarter-guard was striking eleven as I entered the fort. I rode to my quarters, and handed over my horse to my sepoy orderly, telling him to take it to the stable, as my *syce* had not yet returned. A couple of minutes later, as I was starting to go over to the mess for breakfast, a young jemadar belonging to my double-company came running towards me, and said breathlessly, '*Sahib, Shahji mārāyāya*' ('Shahji has been killed').

'What do you mean?' I inquired, forgetting for the moment that 'Shahji' was the name by which Subahdar Farzand Ali Shah was known among the Mahomedans of the regiment.

'Farzand Ali—on the range,' he replied.

'I must go down there and see what has happened,' I said.

Natives of India, in moments of stress, are very much inclined to exaggerate, and the jemadar was evidently in a highly excited state. I hoped, therefore, that the matter was not so serious as he had represented; but in any case it was clear enough that something had occurred which demanded my presence. Fortunately the saddle had not been removed from my horse; so, tightening the girths, I mounted, and galloped through the fort gate towards the rifle-range. About half-way to the firing-point I saw a group of six or eight men advancing towards the fort. As I drew nearer I noticed that the man in the centre had his arms bound behind him, and I recognised him as Debi Sing. The N.C.O. of the escort halted as I approached, and I inquired of him what had happened. He replied, 'This *badmāsh* [evil-doer] has shot Subahdar Farzand Ali and another man. We are taking him to the quarter-guard.'

'Take care he does not escape,' I said. 'March on, and hand him over to the guard.'

A little farther on I met a party of men carrying a stretcher, on which was a figure covered with a blanket. The man, whose face was hidden by a fold of his pugree, was groaning as if in great pain, and one of the carrying-party said, in answer to my inquiry, 'It is the subahdar who has been shot.'

On hearing my voice the subahdar pushed aside the covering from his face, and said feebly, 'Debi Sing—shot me—in revenge.'

I gave orders to the bearers to lose no time in taking him to hospital, and proceeded to the firing-point. Here I found that the remaining men, some forty in number, had fallen in, and were standing at 'attention' under the other two native officers, the senior of whom asked whether musketry practice should be continued.

'No,' I replied. 'Bugler, sound the "Cease fire" and then the "Retire."'

On returning to the fort, I found that a brief outline of what had occurred had already reached the colonel, who was waiting for a report from the medical officer as regards the state of the subahdar. I told him as much as I had been able to learn of the affair. In a short time the doctor appeared, and informed us that the subahdar was suffering from two gunshot-wounds in the abdomen, and there was no hope of his recovery. A sepoy who had been standing near the subahdar had had his arm shattered by a bullet fired at close range, and the arm would have to be amputated.

I later on visited both the men in hospital. The subahdar was quite conscious, and knew that he could not recover. He bade me farewell, saying slowly and with difficulty, '*Huzur*, I have done my duty. See that Debi Sing does not escape; and look after the interests of my wife and son as regards pension.'

IV.

In the course of the afternoon I began, as president of a court of inquiry, to sift and record evidence of what had occurred after I left the range. Native evidence is always unsatisfactory, as, even when a man has nothing to conceal, he generally adds little touches to round off the story according to his own ideas, instead of sticking to facts. But by dint of examination and cross-examination of witnesses I was able to piece together a fairly consecutive story. It appeared that after I left the range Debi Sing went to the N.C.O. in charge of the ammunition, as it was his turn to fire next. He was given the usual ten rounds of ball-cartridge, when, instead of going to the firing-platform, he at once proceeded to charge his magazine. Then, raising his rifle, he discharged it in the direction of Subahdar Farzand Ali, who was standing on the platform watching the shooting. The first shot missed the subahdar,

but struck the man next him in the arm. The subahdar turned round and made a rush at Debi Sing, receiving the next two bullets in the abdomen. He managed, however, to reach his assailant, and seizing hold of his rifle, said very pluckily, 'I am killed, but you shall not escape.' Debi Sing made a struggle to free himself, but was overpowered by numbers, and sent in the charge of an escort to the fort. The N.C.O. of the escort reported that the prisoner had stated quite openly before he was handed over to the guard that he only regretted that he had not also killed the Sahib who had just left the range, but 'he had gone before I got my cartridges.'

I had no idea that Debi Sing had any grievance against me. I had certainly never done him any harm, and to the best of my recollection I had never even punished him. I therefore felt an overwhelming curiosity to know why he should wish to include me among his victims. As it happened, the native officer of the day was under some obligation to me, and he was, moreover, unlike the majority of natives of India, an absolutely truthful man. It would be his duty to visit the quarter-guard and see the prisoner; so I asked him to ascertain, if possible, why Debi Sing should have wished to kill me. He came to me in the evening, and said, '*Huzur*, I have found out from Debi Sing that his grievance against you was that, when he was brought up before the colonel, a word from you might have saved him from court-martial, and subsequent reduction to the ranks.'

'But the matter was not in my hands.'

'No, Sahib; but it is well known that you have the ear of the Colonel Sahib.' (The C.O. had recently been appointed to the regiment from another corps, and naturally looked to me for advice and assistance, as I had served a long time in the regiment.)

'That is a very insufficient reason for wishing to take my life,' I remarked.

'*Huzur*, the native does not think like a white man. You have had a very lucky escape, but it was not in your fate that you should die now.'

The wounded subahdar died in the course of the afternoon, and was buried the same night in the Mahomedan cemetery just outside the fort. I attended the funeral, and was not at all surprised to find that there was strong feeling among the Mahomedans owing to the murder of one of their leading representatives by a Hindu. From some remarks I overheard, I felt sure that there was likely to be trouble between the two races, and persuaded the colonel to give orders that musketry practice should be suspended, and the strictest supervision should be exercised over the ammunition, until matters quieted down a bit.

The next few weeks was a very anxious time for all the European officers, but by tact and careful handling we prevented the Mahomedans and the Hindus from flying at one another's throats. The widow of the deceased subahdar, and the injured sepoy, who, owing to the loss of his arm, was no longer fit for service, received pensions from Government. Debi Sing was in due course tried by general court-martial for murder, and sentenced to penal servitude for life. How he escaped paying the extreme penalty of the law I never ascertained; possibly the view prevailed among the members of the court that he acted on sudden impulse, without premeditation. He was transported to the Andaman Islands, where he is probably still serving his time.

Shortly after the court-martial I discovered what I believe to be the true solution of why the lock in the Treasury should suddenly have gone wrong without any apparent cause. I was sitting in a room with the window wide open, when I noticed an insect fly past me, carrying something in its mandibles. It settled on the keyhole of the door, and I was able to recognise it as one of the solitary bees, belonging to a genus which make their nests in the holes of trees and walls, lining them with circular cuttings of leaves. I did not interfere with her operations, and in a few days the keyhole was quite blocked up. I have little doubt that the obstruction in the lock of the treasure-chest was caused by a similar or an allied insect, and I probably owe my life to the fact that she happened to choose that particular keyhole as a suitable site for her nest.

A SONG OF JOY.

COME, all you little fairy folk,
All you who love to laugh and joke,
And join in merry play—
Up and away this shining morn,
Let's frolic in the golden corn.
Come quick—away—away!

The sun is laughing in the sky;
The white clouds laugh as they sail by;
And in the depth of blue
The birds fly high on eager wing;
And every tender living thing
With joy is laughing too.

Here is a day that's made for mirth,
Here is the mothering fair earth
Alive with hidden glee,
Setting her flowers out to show
A fairy how to 'heel and toe'
In rhythmic melody.

All dressed in colours, bright and gay,
Like painted butterflies at play,
And nodding in the breeze,
Comrades for fairies every one,
Who love to feel the blessed sun
Peep at them through the trees.

Away—away!—we must make haste,
For fairies have no time to waste,
In such a golden day.
Let's fill each moment up with joy;
Pleasure like ours can never cloy.
Away—away—away!

By Sir HENRY LUCY.

PART I.

DR QUAIN—JAMES PAYN—HATFIELD AND HAWARDEN—KATE TERRY.

MARCH 19, 1898.—The death of Dr Quain removes a familiar and popular figure from London Society. He was of the rare class of men who belong to both the Athenæum and the Garrick Club. At the head of his branch of the profession, wearing most of its honours, he had his Bohemian side, and liked to sit at the common supper-table at the Garrick listening to, and adding to, the stream of cheerful conversation. Up to last season he was a habitual diner-out, a constant attendant at evening-parties. For years he seemed to defy the advances of time. On his eightieth birthday he might have passed for a man of sixty. But he never recovered from the blow dealt by the death of his wife a few years ago. He was not seen in any of his usual haunts last year, and for some months before his death was confined to bed. He shared with Lord Morris the reputation of preserving the richest brogue heard in London drawing-rooms. It will be interesting to learn whether he has left behind him anything in the way of memoirs. For the last forty years he has known most people worth knowing. If he wrote as brilliantly as he talked, his memoirs would present a rare picture of life in modern London.

March 20.—Some of the old masters whose portraits of past Speakers adorn the walls of the dining-room at Speaker's House would turn in their graves if they heard that the latest addition to the collection has brought the artist a fee of eight hundred guineas. Eighty pounds was nearer the mark for similar work at the time most of the pictures were done. Opinion differs as to the success of Orchardson's treatment of Speaker Peel. The public will have an opportunity of judging at the forthcoming Royal Academy Exhibition. At present the picture is hanging in the place destined for its permanent occupation in the dining-room at Speaker's House. I venture to predict that it will come to be regarded as one of the artist's greatest works of portraiture.

March 21.—Just now the air is full of farewells to the living and mourning for the dead. A bedside—other than those of Gladstone and Lord Salisbury—the public solicitously watch is that of James Payn. The latest news gives no hope of recovery. Here, as in the case of Gladstone, the sorrow of friends is mitigated by the knowledge that death, when it comes, will lay a soothing hand on long-suffered pain. For some years the novelist has been a prisoner in his room, a martyr to rheumatism. It finally got such a grip of him that his world became limited to the walls of his bedroom and sitting-room, happily with a tree-shaded lawn before the window. I have a bundle of letters received from him since he, perforce, withdrew to the confinement of his two rooms. They, by outward and visible sign, tell the story of his trouble. The earlier ones are written in his plain, neat handwriting, with pen and ink. Gradually comes a time when he finds it easier to write with pencil. Still the same pretty, precise handwriting, marvellous in a man who has turned out so much copy. Of late his letters were dictated, only the signature being in his handwriting.

The final sacrifice seemed made when he had to abandon whist, since he could no longer hold the cards in his maimed hands. He was profoundly touched, when obliged to give up attendance at the Reform Club, by the proof of friendship forthcoming. Passionately fond of whist, it was Payn's daily habit to cross the road from Waterloo Place to his favourite club for luncheon, followed by a rubber. When Mahomet could no longer go to the mountain, as Payn put it, the mountain went to Mahomet. Nine of his old whist friends formed themselves into a little club, and taking turns about, three at a time, drove over to Warrington Crescent to play a rubber or two. Thus twice a week the stranded sick man had his game of whist. He spoke of this, with tears in his eyes, as a marvellous sacrifice of friendship. It was well repaid by the time spent in his company. He was even more charming as a talker than as a writer.

March 26.—It is pleasant to think that

 [*All Rights Reserved.*]

Gladstone and Lord Salisbury have never been personally separated by those outbursts of political acrimony not uncommon in the storm and stress of party government. Gladstone was always ready to pay a generous tribute to the intellectual gifts of his great adversary, but, of course, regarded him as politically a mistaken man. His honesty of purpose, his courage, and his scrupulous honour he was ever ready to acknowledge. At one time he was a frequent guest at Hatfield. In later life circumstances drew the two socially apart. But the feeling of mutual respect and friendship never chilled.

It has been a touching episode in the concurrent illness at Hatfield and Hawarden that kindliest messages are almost daily exchanged between the two households. Though the illness of Lord Salisbury naturally looms larger in the public eye, it is, of the twain, Lady Salisbury who is in peril. Her condition, hopeless, I am afraid, superadded to the weight of anxiety arising out of foreign affairs, has much to do with Lord Salisbury's breakdown. He is now out of danger, and reasonably hopes to come back from his pending flight to the South strong and well. With Lady Salisbury the case, unhappily, stands on a different footing.

The newspapers very properly circulate cheery reports of Gladstone's condition. I am sorry to say that, in the intimacy of the circle closely surrounding him, no hopes are entertained. There is whispered apprehension of a grave cause for the persistent pain in the face, originally attributed to neuralgia. However that be, it is only the final effort of a magnificent constitution that enables the veteran statesman still to resist the decay of extreme old age. No one has a clearer perception of the truth than has the patient himself. There is something pathetic in his remark the other day to his old secretary and faithful friend, Sir Algernon West. 'You must pray for me,' he whispered on parting. That seems about all that is left for his friends to do.

March 29.—Among the group of mourners gathered yesterday by the grave of James Payn there were at least two whose names are to-day familiar in English literature who owed their first step on the ladder of fame to his kindly offices. It was his quick eye and sure judgment that discovered the merits of Anstey Guthrie's *Vice Versâ* when the manuscript, worn with the weary round of other publishing offices, reached his hands at Messrs Smith Elder's. He also gave Conan Doyle a lift at a time when appreciation is most valuable to an author.

In some of the obituary notices mention is made of Payn's ineradicable fondness for London. It was, he used to say, good enough and big enough for him, and he didn't want to go anywhere else. Once, in a moment of always regretted rashness, he accepted an invitation from Inderwick to visit Rye, where the Q.C., who ought long ago to have been a judge, has a house. Payn inveigled his friend Robinson, manager of the *Daily News*, who shared his abhorrence of country trips, to accompany him on this expedition.

'Good-bye, Columbus,' were the parting words of the son of this second adventurer, who went down to the railway-station to see his father off.

Following Inderwick's instructions, the travellers got out at Winchelsea, desperately resolved to see that ancient town before going on to Rye. According to Payn's forlorn account, they, for nearly an hour, walked up and down the sleepy streets without meeting a single person. Going on to the ruined pier, they found the tide out, only a waste of mud in view.

'A dreadful place,' murmured Payn's companion in the day's misery. 'Even the sea has deserted it.'

Returning to the station, they wandered into the yard of an inn where a bus was standing. Peeping in at the window, they discovered a stableman asleep at his ease in the vehicle.

'Ah,' said Payn, 'here 's the population.'

They never got to Rye. Arriving at the station, they found a train ready to go back to London. Recognising in this the finger of Providence, they took their seats, and reached the Reform Club in time for dinner.

Payn used to repeat with great glee one of Burnand's flashes of wit. Among the fancy portraits published in *Punch* some years ago appeared one of the author of *Lost Sir Massingberd*. Payn was represented as half-hidden in the trunk of a tree. Some one said he hardly recognised the likeness. 'Ah,' said Burnand, 'but you never saw James Payn up a tree!'

April 8.—The occasion for the return to the stage of the lady once known as Kate Terry adds pathos to the interest the event has excited in the dramatic world. Many years ago, at a time when, little more than a girl, she had established a brilliant reputation, she 'went and married a linen-draper,' to adapt a remark of Dick Swiveller's. From a worldly point of view the match was excellent, and Miss Terry did not hesitate to conform to the condition that she should quit the much-loved stage. For something like a quarter of a century she (now Mrs Lewis) has lived the centre of a happy and affluent home. Her husband's house has, during that period, been the hospitable rendezvous of some of the best-known men. At one time private theatricals were in great vogue, and Kate Terry was seen on the stage again charming a select circle of friends. By the outer world she was welcomed at the theatre, generally accompanied by her two pretty daughters. She has been a steady first-nighter, renewing her own triumphs in watching her sister Ellen on the Lyceum stage.

A couple of months ago the literary and dramatic world were astonished to hear that the collection of pictures and nicknacks familiar in the home of Kate Terry's husband was about to be sold. Then came sale of the furniture, the quitting of the old home, and the news that a long-established business, gradually fading, could be kept going only by the personal sacrifice of its principal partner. At this crisis Kate Terry's heart, untravelled, fondly turned to the stage. She resolved to go back and earn her own living again. She will make her *rentrée* in about a fortnight's time at the Globe Theatre, playing with her old friend John Hare in a new piece called *The Master*.

Early in the 'fifties' the Queen and the Prince Consort had a series of theatrical performances at Windsor Castle. The manager was Charles Kean. Playing in the title-rôle of King John, he engaged Kate Terry for the part of Arthur. Mrs Lewis tells me she has vivid recollection of that memorable appearance before royalty. It was not only the stage and the audience that terrified a child of seven years old: there was the agony of going through her part with an utter stranger. She was told she must expect Kean to play King John quite differently from any one she had been used to. She must be careful to take her cue from him and get along as well as she could. In this respect she found herself equal to the situation, and all went well on the stage. Her chief terror was the Queen, whom she was astonished to see sitting in a chair and not wearing a crown.

'I felt convinced,' Mrs Lewis says, 'that if I did anything wrong, forgot a word, or didn't promptly take a cue, the Queen would order me off for instant execution.'

How idle were her fears, how great her triumph, is testified from an unexpected quarter. Macaulay, not yet a peer, was among the guests commanded to the play. Writing about it afterwards, he said: 'The little girl who acted Arthur did wonders. It is almost worth while to be past middle life to see Miss Kate Terry play this.'

These are cheering words to sound in the ears of the plucky lady taking up again, after the lapse of many years, the thread of her girlhood's task.

THE MOUNTAINOUS MR NEUBURG.

CHAPTER VI.—*continued.*

IV.

THE guards were shouting, 'All aboard'; Siwash turned and sprang into his car; the skinny man began to stride towards the exit. Clement picked up his bag and went in the same direction. Gatineau cried softly, 'Say, we can't monkey about; we'll miss that train.'

'I'm going to,' said Clement grimly. 'I want to find out why that fellow is here.'

'But——'

'And I don't like his being here,' said Clement. 'I'm not going to leave anybody here to wait for Miss Reys unless I know the exact why and wherefore of his waiting.'

Gatineau was by his side now; he was smiling. 'Yep, I rather want to look at that paper myself. Say, if you catch hold of this grip I'll trail that lad. Best be me—he may have recollections of your outline.'

Fifty minutes later Gatineau rejoined Clement in the lounge of the hotel. 'That's the sort of job that makes a feller ashamed to draw his pay,' he grinned, as he sat down. 'Easy—made me cry, it was so easy.'

'You've got that paper?'

'No, sir; I'm not little Xavier Miracle-Worker yet. But I've got him located. He's in a rooming-house in the dark areas off Portage Avenue—room 163 is his number. And he hasn't the slightest fear that evil men like us are here, and interested in him. Walked all the way to his dive without so much as a look round.'

'That's good; that means that Siwash doesn't know we're here either. He's gone off to Banff and Neuburg without a suspicion. Well, what next?'

'We just go an' call on our lean friend—he calls himself Jean Renadier; he's a French-Canadian all right, though he says he comes from Montreal, not Quebec. I've got a man there spotting for me already, one of our local men, an' I've arranged with the police to pull him on the *Empress of Prague* robbery charge—in silence. Shall we go?'

They went. On the way Gatineau told his plan. 'I arranged that we tackle him first, so that he don't have any chance of destroying any paper on him. Then, when we've got him, we call in the police. We'll just walk up to his room, see. I'll go in, an' you stay outside, because the sight of you might make him do things to his papers. When I've got him, you can come in. Is that good?'

The spotter outside the rather dingy rooming-house told them that Renadier had not left the building. As they went into it, he drew in, ready to help effect the arrest. Walking in boldly, with a casual, 'Renadier—room 163, ain't he?' from Gatineau, they were able to mount to the man's room as though they were friends of his. It was high up in the building,

and at the dark end of a corridor. Gatineau softly tried the handle, found the door yielded, strode boldly in, shutting the door behind him —for the man must not catch a glimpse of Clement.

He went in, and there was silence.

Clement heard Gatineau say something, and then the silence came down. It was a curious silence, intense, deep—disturbing. It seemed to draw itself out. It became full of significance. Clement pressed close to the door, listened—nothing! What was happening? Why did not Gatineau give some signal? Why should there be this appalling silence in that room? It was uncanny; it was unreal—it was ugly.

He bent down in a sudden anxiety and put his ear to the keyhole. Nothing! There was no sound from the room. The room was apparently dead, vacant—a tomb.

He put his hand on the door-knob. As he did so two sounds came from the room—two soft sounds.

One was a soft knock; it might have been the heel of a boot kicking against the carpeted floor. The other was a slow, animal sound, low, guttural, choking.

With a spasm of fear Clement dashed open the door.

V.

An amazing sight met his eyes.

Gatineau was stretched full-length on his back. He was moving nervelessly, struggling feebly. Squatting over him was a tall, inexpressibly gaunt man. This fellow squatted on the detective's chest with an almost stolid calm. His long, lean arms were stretched downward. His thin, knotty hands were about Gatineau's neck. He was carefully and calmly throttling the life out of the little detective.

Clement caught one glimpse of the preoccupied face before it turned upon him. The face of this calmly murderous man was utterly transfigured with fear—fear that, somehow, did not interfere with the efficient labours of killing a man. Then the face turned to him as he charged forward. The fear in the fellow's face leaped to an absolute panic at the recognition of Clement—and yet the fellow acted with an astounding calm.

He simply fell flat. He made no attempt at active resistance; he simply fell flat upon Gatineau. Then, as Clement jumped forward, he rolled, quick as lightning, towards him. It was unexpected. Clement in his stride could not check. His foot caught the lank, rolling body, and he pitched forward. As he fell, the other leapt to his feet, and jumped to the door. Clement had shut the door, and the man caught at the handle. That gave Clement time to grab at him. As he fell Clement had twisted, as he had often done on the football-field. He did not try to recover; he let himself go, while endeavouring to fall as near the door as possible. He succeeded enough to enable him to get his hand to the tall man's ankle. He grabbed and held. He braced himself to resist.

The fellow was astonishing. He did not struggle. For a perceptible instant he stood there at the half-open door, staring down at the man who held his ankle. The look of devastating fear on his face was appalling. Clement had never seen any man so afraid. In that flash—it was no more than a single breath—he felt that the fellow was theirs—nerveless with fear. Then the lank man kicked him.

He kicked with his free foot coolly and deliberately—an astonishing kick when Clement recalled the sheer fright on the fellow's face. So unexpected was it that Clement had only time to half-check the drive of the heavy boot with a quick-flung hand—and then his head rang and he saw a million stars.

After that confusion. The lank man wrenched himself free, and was running. Clement, dazed, tried to get up to go after him. He was knocked sideways by some one rushing by. It was only when he managed to get into the dark passage—which somehow seemed to be misty (but that was the fellow's boot)—that he realised that the man who had bowled him over was Gatineau. He saw Gatineau running along the passage before him. Gatineau was groggy but determined. Rather groggy himself, he ran after Gatineau.

He had to trust to Gatineau. He couldn't see the lean man, but Gatineau seemed to know. Gatineau went upstairs instead of down. Gatineau rushed across a roof-landing instead of going through one of three doors, and flung himself headlong on to a fourth door. That burst wildly open under his charge, letting in a bewildering flash of daylight. They were on the roof. Then Gatineau was running across the leads, and Clement after him—and, yes, there was the lank man running ahead.

The lank man rushed to the edge of the roof, started back, looked round with his incredibly fearful look, then dodged at a right angle. Gatineau could not check in time to head him off. But Clement could. He cut across the fellow's path, and, like a fox, the fugitive tried to double again. He dodged round a stack, and found Gatineau ready for him, pivoted, and ran for the parapet. He scrambled on to the parapet, and stood swaying, staring about him for a loophole of escape. Between him and the next roof was a ten-foot alley, but the other roof was lower, and he seemed to think it was a chance. Clement did not; he yelled, 'Stop that, you fool. You 'll kill yourself.'

It was too late; the fellow had braced himself, had leapt. He went through the air in a way that showed he was no jumper. He seemed to hang in the air for an eternity. Then his feet came down on the parapet on the opposite side. For a breathless moment he hung there, clawing wildly, as though seeking to grasp support from the very air; then his balance went, he sagged

backwards, fell, went out of sight with an uncanny abruptness.

'My God!' cried Clement. 'My God!' He felt physically sick. Gatineau had no time for sentiment. He was already running downstairs. He wanted to get to the man before the crowd.

VI.

Clement Seadon and Xavier Gatineau left Winnipeg by the next west-bound. Gatineau's throat was a little sore, and Clement's soul was more than sick at the death of the man who had played a part in his captivity in the glue-maker's at Quebec; but apart from this they were little the worse for their experience—and little to the good either.

The lank man had fallen into a narrow yard between the houses, and his fall had not been noticed. Gatineau had got to him before anybody else. He had secured all the papers on the poor dead body, and had then seen to it not only that the police were informed, but that the matter was to be kept quiet for the present.

All they had found on the man was a number of letters making it plain that he was Louis Penible, a glue-manufacturer of the Sault Algonquin, Quebec. There was also a single telegram, signed A.N., bidding him travel at once to Winnipeg, where he would be met by 'some one.' This telegram had been sent off from North Bay. 'Before we caught Joe,' said Gatineau. 'It looks as though Neuburg was summoning all his forces to hand rather than anything else. It also means either that they had agreed on this rendezvous before Siwash and Neuburg parted company, or that Siwash has been in touch with Neuburg in some way.'

The only other piece of paper—the piece that had cost the wretched man his life, the piece Siwash had handed him at the station—was merely a plain sheet containing the address of the rooming-house where he had died, and an address, 'A.N., c/o Mrs Wandersun, Sicamous.'

'Beyond telling us that Neuburg has gone on to Sicamous—is not stopping on at Banff—it seems a small thing to have brought about a man's death,' said Clement.

'It might have been a big thing,' said Gatineau. 'It might prove to be a big thing now. Neuburg has one man less: that may be useful to us. It is useful, too, because, so far as we can see, we have the whole gang under our eyes now: two arrested—the steward and Joe—one dead, and the rest at Sicamous or travelling to it. We know where we are.'

But they did not know very much. They knew nothing about the whereabouts of Heloise Reys and her evil companion; they had no inkling concerning the plot Neuburg, the master-mind, had devised, save that it was concerned with a great deal of money, and with the luring of the victim into the wilds—just as it had been in Roberts's case.

They passed across the rolling monotony of the prairies thinking the matter out. They passed through Calgary, a vivid, gold-washed town amid foothills that seemed to cup the sunlight. They heard news of Neuburg and Gunning going on before them, but no other news. They felt they would hear nothing fresh until they arrived at Banff and found reports there from The Chief at Montreal, and perhaps from the agent at Sicamous.

From Calgary they climbed to the fairy ramparts of the Rocky Mountains, austere, snow-cowled, promising immensities and mysteries beyond. They mounted, step by step, the 'benches' of the foothills, beside the breathless azure of the shining Bow River. Then abruptly the gate of the mountains was above them, silent, stark, sheer, brooding, as their train roared through The Gap.

The enormous impassivity of the mountains was about them. The treeless slopes were ruthlessly clear in the crystalline air. They shone with the hard, level washes of gold and gray and purple. Strange, isolated pillars, the 'hoodoos' stood like vedettes on the heights, for ever watching the rising green valley stretching to the mountain gate. Enormous masses of mountains shouldered up, and Cascade Mountain loomed hugely as they edged in pigmy fashion along the gigantic slopes. Then, amid trees, under which the hairy bison cropped phlegmatically, and into a châlet-like station where Indian braves sat long-legged and wiry horses, and braves and squaws in tunics shining like armour in their brilliant close bead-work sold worked Indian leather, and turned scornful backs on kodaks, unless placated with a 'quarter'—they had arrived at Banff.

They went by car to the wonderful hotel perched like Aladdin's palace on a spur amid mighty spurs. It was a peerless place. For the staging of a love-scene one might have gone to the ends of the earth to find a better setting. The exquisite beauty of the surroundings called to the emotions—and yet Neuburg had gone on to Sicamous, had not allowed Gunning to stay. He had rejected this spot and had gone on to Sicamous after but the shortest stay. Why? Clement thought the answer to that unspoken question must be an ominous one.

The Chief had not been idle meanwhile. He had sent word along the line, and the C.P.R. people at the hotel were ready for Gatineau. They had a thick bundle of telegrams and reports ready for him—a bewildering bundle, for it included all Neuburg's wires to his underlings, Nimmo Bates (that is, Joe Wandersun) at the Place Viger Hotel, Montreal, where (thanks to the cunning of The Chief) he was supposed to be staying; Siwash Mike; and others. It contained the wires Neuburg had received, and it contained reports from The Chief himself, from the agent at Sicamous, and others. A truly awesome mass of paper.

'I think I'll let you disentangle the story out of that,' grinned Clement. 'The very bulk of it frightens me, and I guess you are more used to it than I am.'

'Sure,' smiled Gatineau. 'I'll go through this, and knock some sort of connected report out of it. You go an' try a dip in the swimming-pool, Mr Seadon, an' leave it to me.' He was running lightly through the duplicates of the telegrams. 'Hullo! One moment, Mr Seadon; here's one to Méduse Smythe at Winnipeg—that must be to await her coming.'

'What does it say?'

'It tells her to come on here and await orders; it is initialled A.N.'

'Here?' said Clement.

'Yes, sir,' said the hotel manager, who was with them. 'Miss Smythe and Miss Heloise Reys are coming to stay here. There is a suite booked for them.'

'And yet Neuburg and Gunning have gone on to Sicamous,' said Clement. 'What does that mean? What is behind that move?'

(*Continued on page 391.*)

THE MATERNAL INSTINCT OF INSECTS.

By C. A. Ealand, M.A., Author of *Insect Life*, &c.

I.

IT cannot be said that the maternal instinct is very highly developed amongst insects. For the most part, the female deposits her eggs in an apparently haphazard manner, and leaves the rest to fate. There are exceptions, as we shall show.

The ants, the so-called white ants (more correctly termed termites), some bees, and some wasps are social, or, in other words, they dwell in colonies, towards whose upkeep each member is assigned a definite duty. All other insects are solitary; even those with gregarious tendencies, such as certain cicadas and sawflies, live lives strictly comparable to the more obviously solitary species, and do not contribute anything to the advancement of their fellows. With the social insects we are not at present concerned; how the solitary species contrive to exist, and even to increase in numbers, is our immediate concern.

It is a well-known biological fact that the greater the risk of destruction during youth and after, the greater the number of young produced at a birth. Nowhere is this fact exemplified in more striking fashion than amongst insects. Fabre described the life-history of a blister-beetle, which is estimated to produce no fewer than two thousand eggs at a sitting. The reason for this remarkable fecundity is that the young beetles run great risks, for theirs is a peculiar history. Honey is their nutriment in infancy, and means must be found to convey them to the stores of their sweet provender.

The miracle is performed in the following manner. The mother-beetle deposits her burden of eggs near to the nest of the bee which is to act as unwilling foster-mother. In due time the young beetles appear, but they are still far removed from their food. Only one species of bee can help them—the species near whose underground nest the mother-beetle has placed her eggs. The young beetles become attached to the hairy body of the bee as she visits her nest. There are, however, other creatures with hairy bodies besides this, to the beetle, useful bee. Other bees, hirsute flies, and mice may visit the spot, and the young beetles, apparently lacking all powers of discrimination, become attached to their bodies, and are carried away to certain death. From this it is easy to see that only the fecundity of the blister-beetle saves its progeny from extinction.

Let us follow the fortunes of a young beetle which has become attached to the right species of bee. The youngster clings to its foster-mother as she passes below ground to her nest; however she may be employed, he never releases his grip till she proceeds to deposit an egg on the honey which she has stored in one of the cells of her nest. This is the signal for him to bestir himself. Releasing his hold, he slips upon the newly laid egg, which floats, boat-like, upon the semi-liquid honey. Later, the bee, oblivious of or not heeding the presence of the young beetle, seals up the cell, and he is left in possession of a goodly store of food, with the collection of which his own mother has had no part. Left to himself, the immature beetle devours the contents of his host's egg, and, in its shell, changes his form to one better fitted for life in honey. Having done so, he turns his attention thereto, and by the time it is completely devoured his development is complete. Eventually an adult blister-beetle emerges from the cell which the industrious bee had constructed and stored with food for her own progeny. The bee's maternal cares, however, ended when she sealed the mouth of her cell, after having deposited an egg therein, and she, at least, is ignorant of the tragedy that has occurred.

Our common British oil-beetle has a life-history strikingly similar to that of the insect so ably described by Fabre. The successful upbringing of its young is even more precarious than in the case of the blister-beetle. Therefore, following the inevitable rule, the female produces a greater number of eggs. Ten thousand is no uncommon number. The young oil-beetles live upon honey—honey collected by the species of bee we have just mentioned; moreover, they are

conveyed thereto on the hairs of the female bee. Why, then, when the ways of the two beetles seem so similar, should one species produce five times more eggs than the other? For the reason that the British oil-beetle has not learned the art of depositing her eggs near the nest of the one bee capable of helping her. She deposits her enormous burden anywhere, at haphazard, so that the chances of a bee—the right bee—coming along are somewhat remote. Nevertheless, a goodly number of the youngsters do manage to get conveyed to the honey, and to develop into adult oil-beetles.

One may argue that the blister-beetle displays some slight maternal instinct in placing her eggs where they will have a reasonable chance of developing into adults; the oil-beetle, on the other hand, takes no precautions whatever towards ensuring the continuance of her race.

II.

One need not be possessed of very great powers of observation to notice that insects whose young feed upon vegetation deposit their eggs upon or near their food-plants. The lackey moth, to take one example, encircles the apple-twig with its ring of eggs, that with the bursting of the leaf-buds its caterpillars may find their food at hand. How, precisely, insects which in the adult stage never partake of vegetable food are guided in their selection of suitable sites for the deposition of their eggs long remained a mystery. Much has been done towards an explanation of the phenomenon, but much remains to be learned. Many plants, we know, possess substances, usually oils, which impart to them distinctive odours. Mustard is an example which readily occurs to mind. If these substances be extracted from various plants and smeared upon fabric, it will be found that insects will deposit their eggs upon those pieces of fabric which are impregnated with the substance peculiar to the food-plant of their larvæ, though they avoid fabrics containing the oils of other plants. The sense of smell, therefore, probably plays an important part in guiding the mother-insect in her choice. The selection of a suitable site for the deposition of her eggs does not entail a great amount of parental responsibility on the part of the mother-insect.

The choice of a site likely to be congenial to their larvæ is not confined to those insects whose young feed upon vegetation. The female ant-lion always deposits her eggs upon sand, for in this substance alone can her curious larvæ construct the ingenious pits in which they capture their prey. The American Dobson, to quote another example, lays its eggs upon some structure overhanging water, so that when the larvæ hatch they may fall into the element in which they are destined to dwell. The closely related British alder-fly is not so solicitous of the welfare of its progeny, for its eggs may or may not be deposited near water, and in the latter event the larvæ must needs crawl thereto with all haste.

The few examples of solitary insects which are known to mother their young, after the manner of birds (the cuckoo always excepted), may almost be counted upon the fingers of one hand. The maternal instinct of insects reaches its highest pitch in an Australian sawfly. Like others of its kind, the female saws clefts in a leaf, and therein deposits her eggs. 'On this leaf the mother sits till the exclusion of the larvæ; and as soon as these are hatched the parent follows them, sitting with outstretched legs over her brood, protecting them from the attacks of parasites and other enemies with admirable perseverance.'

The common earwig moves her egg-batches hither and thither to whichever spot she deems most suitable for them. The cockroach, usually, but erroneously, called the black-beetle, for the reason, probably, that it is neither black nor a beetle, is very careful in the selection of a suitable site to place her egg-purse. The purse, by the way, is formed within the body of the mother-insect, and very closely resembles a miniature snap-purse, closed at the bottom and the sides, but open at the top, though held together by the tension of the sides. Each egg-purse contains sixteen eggs, arranged in two rows, with the ends from which the larvæ will emerge pointing towards the top. The female cockroach carries her burden from place to place, and only when she is satisfied that no danger will befall her eggs does she drop the purse.

Eggs are carried from place to place upon the backs of certain large South American water-bugs. For long it was thought, perhaps naturally, that the mother-insect took upon herself the duties of wardress. Further investigation, prompted by the fact that the insects bearing the eggs were frequently observed to make efforts to rid themselves of their burden, showed that the males carried about the eggs, which were deposited upon their backs by the females.

III.

If now we turn our attention to certain of the solitary wasps and bees, we can trace the gradual development of the maternal instinct, so far as these insects are concerned.

In the case of many of the so-called digger-wasps, the nest is built at the end of a short tunnel in the ground. In each cell the mother-wasp places a single insect, or a spider, which she has paralysed by a bite from her mandibles. On this living, though inert, food she lays a single egg, closes the mouth of the cell, and leaves the nest for ever. The young wasp finds his food at hand directly he comes into the world; moreover, being merely paralysed and not killed, it is just to his liking, for it is fresh meat.

Our largest native sand-wasp stores caterpillars for its larvæ. Two caterpillars in each cell, and a single egg upon one of them, appears to be the almost invariable rule. Another of our common sand-wasps exhibits maternal instinct of a more advanced character, approximating that of the birds. It, like its relative, feeds its larvæ upon caterpillars, but it scorns the lazy habit of rendering a few insects harmless, placing them in its nest, and taking no more thought for the welfare of its family. On the contrary, this species returns to its nest from time to time, bringing fresh caterpillar food for its growing family.

The solitary insects, at any rate, with very few exceptions, exhibit little more than the rudiments of maternal instinct. 'The wild bee that seals up its cell when it has laid an egg therein, and then leaves it for ever, has no conception of the form of its progeny; never in the history of the race has a larva seen a perfect insect and survived thereafter; never has a perfect insect seen a larva.' What is true of the wild bee is true also of other solitary insects.

IV.

Let us see if the case is any better amongst the social insects we mentioned earlier in this article. There we enumerated the few truly social insects; but there are some species on the border-line, uncertain, as it were, whether to adopt a social or a solitary mode of life. This state is beautifully exemplified in certain species of our smallest native bees. Several females nest in a common burrow; the entrance to the burrow is shared alike by all the inmates; the side-galleries in which the females construct their cells are each the property of a single individual. 'A sentinel is often stationed at the entrance, and there is, close behind the doorway, a small recess, into which the sentinel can step whenever she wishes to allow a member of the establishment to pass in or out.' This form of housekeeping is very different from that which prevails amongst social insects; the bees resemble dwellers in a block of flats, with their own private homes, but all sharing common stairs and front-door.

One might excusably surmise that the maternal instinct would reach a very high level amongst the social insects, where the young are never exposed or left to their own devices. We may well examine a few cases more closely to see whether the surmise be correct. We possess two common, subterranean-nesting bumble-bees in this country. The life-histories of the two species are so similar that a description of one applies equally to the other, except in minor details. In the spring a female, which has hibernated through the winter, seeks a deserted mouse-hole or some such spot in which to build her nest. Having collected a lining of moss, she constructs waxen cells, which she stores with honey-saturated pollen. More and more cells are built and stored with food, and in all of them eggs are laid. When the larvæ emerge from the eggs, the mother-bee, who is known as the 'queen,' opens each cell and feeds her progeny with food from her own mouth. In due course the larvæ develop into small females, known as 'workers,' whose duty it is to build more and more cells, store them with food, and feed the larvæ which continue to appear throughout the summer. The sole duty of the queen, when once she has seen her first brood safely into the world, is to lay eggs in the cells constructed by the workers; she lapses into little more than an egg-laying machine.

Very similar is the story of the common wasp. The female destined to become a queen constructs the first cells of the nest herself. These early-formed cells may always be known by the fact that they are of finer texture than the later cells constructed by the workers. Having deposited a single egg in each cell and tended the larvæ which arise, she, like the queen bumble-bee, performs no other duty than keeping the ever-growing number of cells stocked with eggs. The queen wasp feeds her young upon insect food, for no wasps store honey in their nests. To obtain this food she leaves the nest; but when the first dozen or so of her family are able to fend for themselves, she takes up her permanent abode within the nest, and never leaves.

V.

From the cases we have studied, it is clear that in the early days of the colony the mother-insect shows considerable solicitude for the welfare of her family, but that when once she has given the elder members a good start in life her maternal cares cease, except in so far as concerns the production of eggs.

The queen of a termite colony displays no motherly love. She goes to her new colony, after mating, with a number of workers from another colony. The workers build a royal cell as a dwelling-place for their queen — royal prison would be a more appropriate term, for she is usually so closely confined that she could not escape if she would. The workers build the nest, and look after the young so far as they require attention; but they are by no means helpless, and are early able to look after themselves. In some species the queen becomes so distended with eggs that she resembles a small potato, and her egg-laying capacity makes the efforts of our native oil-beetle appear amateurish. Some of these queen termites produce eggs at the rate of sixty a minute, or eighty thousand a day. No wonder that they are relieved of all other duties!

The last of our social insects, the ants, vary so tremendously in habits (no two species are precisely similar in this respect) that it is impossible to outline one life-history that will apply to all. Omitting details, we may say that the future queen, after mating, excavates a burrow by the aid

of her mandibles, and that she often suffers considerable mutilation in the effort. At the end of the burrow she constructs a chamber, in which she waits, it may be for months, the time when her eggs are ready to be laid. She tends the eggs herself, perforce, for she dwells alone; feeds the young from her own mouth; and during the whole period, which may extend over nearly a year, she takes no nourishment, her sole means of sustenance and that of her young being derived from the fat stored in her body. When the young workers are capable of carrying on the work of the growing colony, the queen limits 'herself to the laying of eggs and imbibing liquid food from the tongues of her attendants. . . . With this circumscribed activity she lives on, sometimes to an age of fifteen years, as a mere egg-laying machine.'

From our cursory review it is evident that the maternal instinct of insects is at a low ebb, and cannot well be compared to that of most of the higher animals. That the duration of life in adult insects is usually brief accounts for much, and other arrangements have been made for the continuation of the species. Many insects die at, or very shortly after, the time of egg-laying, and these could not, if they would, show any solicitude for the next generation of their kind. The popular idea that the social insects exhibit a higher degree of maternal instinct than those of a solitary nature does not bear investigation, for the sole object of the mother-insect is to found her colony as a going concern, and then leave its attendant troubles to her elder children.

There may be insects which would justify the term of model mothers, but so far, with the possible exception of the Australian sawfly mentioned above, they have not come to light.

WHO KILLED GRABASKY?

PART II.

III.

THE approach to the Weir Gate, as the newspaper report told, was as sombre a walk as could well be imagined. The waters of the river Nettle, stemmed here, in their descent to the pool below, by the weir, were dark and sluggish, and overhung by willows and bushes; while the grass on the banks grew rank. Little sunlight penetrated to the place; it was a damp pleasaunce of toads and creeping things, a fit theatre for tragedy.

So stiffly upright and motionless stood a figure in blue by the gate that at first the canon did not observe it. It was Gilbert's remark, 'This fellow can show us the spot,' which caused the clergyman, with a start, to become aware of the constable left on guard over the scene.

It was, of course, permissible to any member of the public to sate his curiosity in viewing the place, and the policeman had regarded the strangers in silence.

'Where was it found?' asked Gilbert.

'By that hawthorn yonder,' the man did not mind informing them, 'where the grass is pressed down.'

This would be some twenty yards from where the policeman was standing. The canon, glancing uncomfortably about, found the hawthorn only a few yards away. The long grass growing from the bank on the side of the path showed where a body had lain.

'Ah, I see—here,' murmured Gilbert.

He descended the bank, and stood looking at the spot and its environment. He then approached the bush and surveyed it closely, finally stooping and apparently plucking a twig from it. Next he gazed at the Weir Gate, as if measuring the distance.

He now walked up to the constable, the canon following. 'Were you the policeman who found the body?'

'I'm told not to tark about it,' was the surly answer in broad Oxfordshire.

'This will permit you,' said Gilbert, taking from his pocket the buff 'chit' which the superintendent had handed back to him after inspection.

'What be this?' asked the man.

'Well, it is signed by a name you ought to recognise, my good fellow,' was Gilbert's impatient reply. 'Were you or I guilty of this murder, and the day of doom had arrived, he is the one man in the kingdom who could save us.'

'He be that, eh?' The man's eyes had opened wide.

'The Home Secretary,' Gilbert said briefly. 'We are officials investigating this case, and this is our permit. Read it.'

The man read the scrawl. 'Aye, zur, I've got it.'

'Well, now, tell me—did you find the body?'

'No; it was my mate on night-duty. I had come off, but he fetched me. I helped take it away.'

'Did you notice whether the clothes were scorched in the neighbourhood of the wound?'

'We took note of that, mister,' the man answered. 'It was a little hole, and there was no scorching. You'll be axin' to find out whether the shot was fired close or from a distance?'

'That is what prompts my question. Thank you for the information; it will help us. Now we will pass through this gate into the walk beyond.'

The policeman regarded him doubtfully. 'Orders, sir, none is to pass through.'

'Open the gate!'

The man hesitated, then turned and pushed the gate open. 'I take it you have a right,' he said.

'Well, you have eyes to read,' grumbled Gilbert. 'Come on,' he threw over his shoulder at Smith.

They went through, to find themselves in continuing sombreness, in a walk that seemed as if it were seldom paced, for moss had crept over the path and weeds grew in abundance. The path pierced a thicket that surrendered in time to the pleasant openness of the park.

Now the canon breathed more freely. 'Are you going far, Gilbert?'

'I am going to the house.'

'With what object?'

The cluck sounded. 'Not to view its Reynolds, nor yet its Morlands, but to interview its mistress.'

'You don't really think—you don't imagine—surely, my good fellow——'

'I don't think she shot him, if that is what you mean,' replied the philosopher, 'because she was standing too close to him.'

'*She* was?'

The cluck again. 'She was mixed up in it, as you'll see. It was no common attack for money, dear friend. Deeper motives were involved, or call me a fool for ever.'

'I don't want to do that; but aren't you allowing your imagination a little too much rope?'

'We are engaged to employ our imagination. I have formulated a theory—but I must see her.'

'You don't tell me much,' the other said in something of a huff. 'Now, do you know what I think? To begin with, it is presumable that at this time of the year the countess will have been away—at her Loamshire seat, say.'

'Go on.'

'The place will have been left in the charge of servants. The situation is lonely, and I can imagine even domestic nerves suffering, especially with the papers so full of tales of violence. Grabasky sends his note, and proceeds to the rendezvous. She does not appear. He grows impatient, and enters this path. A man of the house, possibly a new servant who did not know him, strolling in the grounds, espies and challenges him. A rather taciturn fellow, Grabasky would return a sullen and unsatisfactory answer. The servant would regard him with suspicion, and, emboldened by the possession of a revolver which 'nerves' have caused him to carry, tells the intruder to put his hands up. Grabasky resents this; a struggle ensues; the revolver is brought into play. Frightened by the fatal result, the servant might have dragged Grabasky out of the grounds and flung him down at the place where the body was found.'

Gilbert clucked. 'A very fair attempt, George. But the countess got rid of all her indoor men during the war. I remember reading something in the paper about the "example" she had set.'

'She would have got them back by now.'

'Possibly. Though many people have grown content to carry on with females. They may be expensive, but they are cheaper than men. And in any case, if she were at her Loamshire seat, most of the servants would accompany her. I don't see your man-servant left alone and growing nerves.'

'Curious she let all the men go. It is a lonely place to be protected by women.'

'There would be oldish men on the outdoor staff left. And then—there was her secretary. He was there until she locked him up.'

'She had a male secretary?' asked the canon in some surprise. 'Living here?'

'Living here. She organised some sort of war fund, and a considerable amount of money would be in her charge. This secretary fellow robbed her, and she shut him up.'

'Indeed! Was he sent to prison for a long term?'

'A considerable term, I believe.'

'I wonder,' said Canon George Smith shyly, 'whether there was anything "between" them at any time.'

'Ah, I wonder!' said Gilbert. 'If there was, it was hardly gallant of him to rob her.'

'Perhaps he presumed on her—liking for him.'

'Men do. They think a woman will overlook anything. But just about then Grabasky came on the scene. Women are callous creatures when they drop the old love for the new.'

'Dear me!' breathed the canon. 'You infer that she—well, found it convenient to pack the secretary off to prison in order to give Grabasky a clear field? If that is so, she must be a somewhat—er—doubtful character.'

'The adventuress of the heart, my dear George, is to be found under every kind of roof. . . . I think we had better cut across here to the drive, and approach the house in the accepted manner.'

Surmounting an iron railing, they got into the drive, sombre with oaks and 'immemorial elms,' and in a few minutes stood at the front-door of the mansion. Gilbert gave the old-fashioned hanging bell-pull a sound tug. There being no immediate response, he again rang, and after another short wait the door was opened, though hardly in a welcoming manner, and a personable, well-built servant, in the black coat and gray trousers that a butler sports in the day-time, surveyed them (as it struck them) a little furtively.

Gilbert asked, 'Is her ladyship at home?'

'I will see, sir. Your names and business, please?'

'You need not "see." If her ladyship is at home, I must *request*'—Gilbert's tone was firm—'an immediate interview with her. . . . Mr Gilbert and Mr Smith, of Scotland Yard.' And urging the door wide, Gilbert followed his words in.

The man apparently concluded that he must accept their presence.

'I will ask you to wait here a moment, gentlemen.' (After all, they did not look like daylight raiders, and one of his colleagues was near at hand.) Closing the door, he left them in the hall and disappeared.

It was an old house, as the musicians' gallery above them proclaimed. During that lamentable conflict forced upon the nation by the wrong-headed statesman and bad general, Charles I., albeit he was a kingly man and died like one, this old house, like many in loyal Oxford county, was gallantly defended, but in the end sacked and burnt, to rise with new splendour from its ashes. Even at this moment such a poet as Churton Gilbert must have been thinking of its past.

'Treasures, Smith!' Gilbert seized his friend's arm. 'The pictures, man! Yonder is the Reynolds—over the fireplace. Notice the bland Reynolds expression. And that smaller one yonder is a Raeburn,' he told the canon. 'The late earl's father bought it in '88 for six hundred pounds, and to-day it would make fifteen thousand.'

'I wonder what poor Raeburn got for it,' murmured the gentle priest, as the butler reappeared.

He conducted them in his smooth and silent way to the library. Though their errand was what it was, the canon noticed his companion glance about him, as they entered the room, with green envy in his face. And indeed it was a room calculated to entrap the heart of a bibliophile.

'Her ladyship, gentlemen, will be with you in one moment,' said the servant, closing the door upon them.

'I wish,' cried Gilbert with enthusiasm, 'she could make her moment last a day! Look at this Shakespeare, Smith! It has but two brothers in the entire world.'

Works of art, however rare, had small appeal for the divine at any time. 'Why are you prattling about Shakespeare?' he asked irritably. Then, in a lower voice—for what look like books are sometimes doors, and a door slightly ajar has ears—'She has her men-servants back. What about my theory? Why not have all the men in and question them——?'

Then he turned and bowed, and Gilbert bowed, for the countess was awaiting their pleasure. She was, as Gilbert had said, beautiful. Her years would approximate to forty, but the freshness and purity of her complexion, the burnish of her rich chestnut hair, belied them. Her figure, too, was supple, yet it was of full and womanly mould. Her dress, though quiet, did not suggest widowhood. There was nothing of the sequestered mourner about her. The expression of her face was collected and slightly haughty, yet she had a mouth, surely, that was shaped for a lover's kisses.

The canon was a little overcome, for here stood nature's premier creation — a beautiful Englishwoman.

But Gilbert, thanks to much public speaking, was a very ready fellow.

'We owe your ladyship our apologies for this intrusion,' he said courteously, 'and will detain your ladyship no longer than is absolutely necessary.'

Beautiful under all circumstances, her face, nevertheless, was slightly drawn; there were shadows beneath the eyes suggesting a night of broken sleep or a shock.

She bowed, but did not ask them to be seated.

'You were acquainted, I believe, Lady Loamshire, with the late'— Gilbert paused the least over the adjective—'Professor Grabasky?'

'I was.'

'You *were?*' The canon could have sworn a very dim, ghostly 'cluck' sounded in his friend's capacious gullet. 'And were you expecting to see him last night?'

'I thought it possible. There was no appointment.'

'And—did you see him?'

'I did not.' The three words were cool and hard.

'You did not? And you are sure he did not call at the Hall? The servants would know, you will bear in mind.'

'I am quite sure.'

'You will pardon me, Lady Loamshire, but I am making an official inquiry. You are quite sure you did not see Professor Grabasky last night?'

'Have I not said, sir?' she answered sharply.

Gravely Gilbert responded. 'Certainly you have denied seeing him, but I must beg leave to doubt that statement. For you were standing close to him when he was shot.'

'What do you mean? *I!* Standing by him! This is an impertinence, sir! Let me repeat, I did not see my—my friend last night. I have not seen him for months.'

It seemed to the two inquirers that her voice faltered a little as she spoke these final words.

'You were wearing,' persisted Gilbert, 'a silk cloak with a fringe. Your cloak caught upon a hawthorn-bush, and a particle of the fringe was left behind.'

'You are mistaken, sir!' she declared haughtily. 'Couples'—her lip curled slightly—'use the path. It is quiet. I repeat, you are utterly mistaken as regards myself.'

'Yes, it is quiet, and couples doubtless use it. A couple was using it last night. Look—come to the window, will you?—tell me—is not this fragment from a light cloak that you wear on a warm evening?'

'I did not go out last night,' she said briefly.

'It seems I must accept your statement.' Gilbert retired from the window. 'A garment of yours may possibly have been borrowed by—let us say—a domestic.'

'Such a liberty is not unknown.'

'We will suppose that.' He tucked the little tuft of silk into his waistcoat-pocket. 'So let

that pass. Now, one further word. Will you, Lady Loamshire, be so good as to view the body of the professor, and permit us to add your identification thereof to ours and that of others who knew him?'

'I—would rather not.'

'Doubtless. But will you?' Gilbert spoke almost roughly—at any rate, with a certain challenge.

'Why should my identification of the—remains be necessary?' she asked with difficulty.

Again, and this time distinctly, came the cluck; it had a sinister sound.

'Because, Lady Loamshire, it is possible—just possible—that some very acute sleuth of a detective might, in spite of the fact that the body was clothed in Professor Grabasky's clothing, and that letters and papers belonging to the professor were found in the pockets of the coat—might, I say, raise the point: *Is* this, after all, the body of Professor Grabasky? And, if it is not, *where is the professor?*'

He looked full at her.

'Do you see?'

'I see. I suppose I must accede to your request.'

'I was sure you would—and you will come now—with us?'

'I will order my car, and come now.' Her hand moved to her heart. 'Where is—it?'

'In the outhouse of a place called the "Haven of Rest."'

'Oh, yes. That is near. If you will be good enough to wait a few moments—may I send you some refreshments?'

'You are very kind,' Gilbert said. 'I shall boast all my life that I have drunk a glass of wine in the Loamshire library.'

Her eyes were resting absently rather than curiously upon him. As for the canon, he might not have been present.

'Then you shall enjoy that privilege.' And she was gone.

Humming softly, Gilbert was beginning to browse round the treasures on the shelves, when the canon seized his arm. 'Gilbert—you can't. You mustn't drag the sweet creature to that hovel——'

'Wait,' said Gilbert. 'And remember, my dear George, that you are a married man with grown-up children.'

WITCHCRAFT IN CHILE.

By Oswald H. Evans, F.G.S.

I.

THE mediæval type of witchcraft, with its machinery of malign old women, less well-defined wizards, broomsticks, black tom-cats, he-goats, 'Sabbaths,' and compacts signed in blood, belongs, in Great Britain at least, to the past. A few traces may linger; here and there in remote districts within 'the Celtic fringe' there may still be old women suspected of 'overlooking' cattle or of having recourse to means of working evil (or, it may be, good) that are dependent for their efficacy on the appeal they make to the imagination. Witchcraft has ceased to be a factor in the daily lives of the people.

In countries that lie off the main course of the world's activities, however, witchcraft still retains something of its former prestige. I do not refer to peoples of non-European blood among whom magic and religion are almost synonymous terms, but to the more isolated communities of European descent, and especially to those of South America. In spite of the great strides taken of late years in the development of the Southern Continent, it remains, as a whole, in a backward state as regards education and popular enlightenment. If, in the following handful of notes and stories, I draw my illustrations from Chilian sources, it is because of my familiarity with that South American Republic, and not because so energetic and progressive a state as modern Chile affords more examples of superstitious beliefs and practices than do its neighbours.

It is interesting to note that the witchcraft of the past, the witchcraft of Ainsworth's *Lancashire Witches*, as revealed by a considerable number of judicial and ecclesiastical investigations in past centuries, has recently been submitted to scientific scrutiny by a lady, Miss Murray, who has published the result in the form of a theory, and has succeeded in throwing light in some very dark corners of human perversity. According to this view, briefly stated, witchcraft and its allied practices represent the relics of a prehistoric cult that survived in mutilated form, maintaining a struggle for centuries against Christianity. Originally a form of animal worship, probably connected with totemism, it retained this central idea, which appears in the animal vehicles assumed at will by the witch and the wizard. In continual conflict with the Church and its ministers, it accepted the conventional Devil, absorbed and travestied its ceremonials, and even imitated its organisation. At no time, probably, were its votaries, most of them poor and ignorant, fully aware of this, and the cult degenerated ultimately into a farrago of meaningless and inane formulæ. Like other diseases of an epidemic character, witchcraft gradually lost its malignity as education, the fresh-air and daylight of the

mind, penetrated the dark recesses where it for so long maintained a parasitic existence.

Malignant and baleful it undoubtedly was, dangerous in its employment of agents, both physical and psychical, that lowered it to deeper levels than those of vulgar fraud. The 'Witch-finders,' from King James downwards, whose errors and cruel excesses resulted from genuine zeal, merit obloquy rather by reason of the means they made use of, fighting evil with evil, than for their intentions. They believed that they were combating a very horrible reality, doubly urged thereto by their obligations as magistrates and as Christians. With which expression of a personal opinion that many may regard as reactionary, I will pass on to the subject of witchcraft as it still lingers in the towns and the rural districts of Chile.

II.

Chile, in spite of its great length extended along the South Pacific seaboard, has to-day less than four million inhabitants; of these the greater proportion are of Spanish descent, though a mere glance into a crowd of the lower orders suffices to reveal evidences of a considerable admixture of the indigenous races. The population is concentrated in a few large towns and in industrial regions—for example, in the nitrate district of the north. It follows that the vast rural areas, cultivated valleys, and the central plain, flanked by wildernesses of mountain and forest, are very thinly peopled, and by reason of their isolation have remained unchanged in essentials for centuries.

Education, despite the good intentions of the Government, is not at a high level, the percentage of illiteracy being very high, especially among the women. In the south, the Araucanian Indians still predominate in certain districts, though hard put to it by the continual pressure of encroaching German settlers.

It is no exaggeration to say that the rural population of Chile is saturated with superstitions. At every turn these are encountered, operating as potent influences in the daily life of the people. Sometimes they are merely laughable, occasionally serious enough.

An instance of the first kind occurred no longer ago than yesterday, when the writer innocently broke a taboo. It seems that a woman must not gather figs. As a lazy gardener had neglected to collect the fruit which was wanted for the dinner-table, I sent a servant-girl up the ladder. There was at once a dismal outcry from the gardener and his wife. The tree is doomed; it will bear no more fruit; the figs of this season will wither on the branches.

A more malevolent manifestation of superstition was recorded in the newspaper a short time ago. Two women were found in possession of the head of a newly buried child, which they had disinterred from the public cemetery for use in a way of which they could give only a confused account. In some unexplained way the spoils of the burial-ground were supposed to confer good luck on the ghouls. The instance is by no means a solitary one.

The belief in buried treasure is very prevalent in Chile, not wholly without justification. The country has suffered so much from 'alarums and excursions'—whether from Indians during the Colonial period, from loyalists and patriots during the War of Independence, or from civil contentions that appear inseparable from the best-ordered of Latin-American states—that on many occasions families have buried their most valued possessions, and left the locality, sometimes, through accident of fate, never to return. Now, a treasure thus hidden may for one year be taken up by the fortunate finder without let or hindrance, but at the expiration of that time it passes into the custody of the witches, and it is no easy task to obtain possession of it. Even should the deposit be met with by accident, by a blow of the spade or removal of bricks in the course of pulling down a building, it is necessary that special precautions be taken. No word must be spoken; not even an exclamation of surprise and delight is permitted. If the silence is broken even by an ejaculation, the treasure vanishes, to be hidden elsewhere. Keep silence, turn your back towards it and grope for it blindfold, and it is just possible that you may succeed.

The deliberate search for buried treasure is beset with extraordinary difficulties. Times and seasons must be taken into consideration; silence, darkness, and solitude are essential. The searcher must steel his heart against unknown perils; he must be prepared to see and hear terrible things. The determined treasure-hunter, however, may avail himself of certain mechanical aids, if we may so call them. These are varied; but the following, I am informed, was tried, without success, in the locating of a treasure supposed to exist on a hillside within half-an-hour of Valparaiso. The witches who guard the gold can often be seen at night from the public roadway, in the form of flickering lights known as *candilillos*. The midnight hour approaching, the seeker prepares a hollow gourd. Inside this he fixes a candle and a reel of cotton, so arranged as to unroll easily. Arrived at the spot, with his spade and sack to dig up and carry off the gold, he awaits the propitious moment, repeating appropriate formulæ, and supporting as best he may the molestations of the guardians and their familiars. (It is a characteristic touch that in Valparaiso the witch often takes the shape of a mounted policeman, more often still that of a *perro bravo*—a savage watch-dog.) Sometimes he hears people coming. But this is all illusion. At midnight he lights the candle *in the gourd*, takes hold of the end of the string, and flings the gourd so that it rolls along the

ground, leaving him with a clue of thread with which to track it to its resting-place. At the spot where the gourd lies he must dig. The witches redouble their exertions; policemen and dogs converge upon him from all sides. When the treasure is revealed at last, a horrid shape is seated on it, the guardian-witch in person, who abuses him with more than the eloquence of a Chilian market-woman. It is not surprising that the witches generally manage to retain their hoards.

III.

It will be seen that the account given above falls into line with similar stories in many parts of the world. In certain respects, however, Chilian witches differ from those of Europe, thanks, possibly, to their having learned a thing or two from the Araucanian medicine-women. The *Chon-chon*, for instance, seems to be peculiar to the country.

In its least romantic form the Chon-chon is merely a night-bird with a harsh and bodeful cry, auguring evil. Some of the nocturnal birds of Chile have lamentable voices, and the popular beliefs concerning them are widely diffused. This bird, however, is no true bird, but the vehicle of a witch, and is nothing less than the head of the sorceress, using its ears as wings. At Chillan, not long ago, it is recorded, the people turned out nightly to listen to a Chon-chon that flew over the town in the darkness, uttering its doleful cry. The bird is easily brought to earth. A pair of scissors opened till they form an 'Iron Cross' will cause it to fall with a bump when it attempts to fly overhead. A better method still is to trace the figure of the 'seal of Solomon,' the interlaced triangles, in the dust.

In a very interesting Spanish work on the myths of the Chilian people, published in Santiago by Señor Cifuentes, an excellent story about the Chon-chon is to be found. The scene is laid in Limache, a small town situated about an hour's distance by rail from Valparaiso. The date of the happenings is not given, but a mile or two from the railway it might as well be yesterday as a hundred years ago.

One night some people were gathered together in the room of a farmhouse—one of the low-walled *adobe* buildings, roofed with large red tiles, that are still found in country places. The winter nights are long in central Chile, the lighting arrangements in farmhouses of the most primitive kind. The people sit, and often actually squat, Indian fashion, round a *brasero* of glowing charcoal, the noxious fumes of which afflict them with headaches, which they relieve by sticking postage-stamps or plaster on each temple. That, to me, 'discomfortable drink' *maté* circulates in a small gourd-shaped vessel, each person taking a pull at the *bombilla*, a kind of spoon-strainer perforated to let the liquid pass, and handing it to his neighbour. The conditions of semi-darkness and carbon-monoxide fumes would be propitious for the untoward happenings that are to be described. A Chon-chon passed overhead, giving its melancholy cry—*Tue-tue-tue*. They should have thrown burnt salt in the air and said, '*Go thy ways, Chon-chon, and I will go mine.*' One of the company, however, traced the symbol on the mud floor, and a heavy fall was heard on the tiled roof. All rushed out into the *patio*, and found a bird the size of a turkey struggling on the ground, from which it was unable to raise itself. They killed it, and cut off the head, which was red and naked, like that of the vulture. A dog ate the head, and the trunk was flung, in harmony with Chilian ideas of sanitation, on the roof. Shortly afterwards a great outcry of mournful sounds told the people that the mates of the dead witch had come for the body. At the same instant the dog that had eaten the head of the bird suddenly swelled up, and all could see that the appearances warranted the belief that the head had reverted to its human shape.

The following day the grave-digger of the place had a tale to tell. At earliest dawn a great company of unknown people, clothed in black, had buried a headless body in the graveyard.

IV.
